INITIALS AND NAMES OF CONTRIBUTORS IN VOLUME V WITH THE ARTICLES WRITTEN BY THEM.

| | | |
|-------------|---|--|
| A. A. F. | AMOS ALFREY FRIES. Major General. Chief Chemical Warfare Service, United States Army, Washington. Co-Author of <i>Chemical Warfare</i> . | Chemical Warfare (<i>in part</i>). |
| A. B. Go. | LADY GOMME Hon. Member of the Folklore Society. Author of <i>Dictionary of Traditional Games of Great Britain and Ireland</i> ; <i>Children's Singing Games</i> . | Children's Games (<i>in part</i>). |
| A. B. R. | A. B. RENDLE, M.A., D.Sc., F.R.S. Keeper of the Department of Botany, British Museum of Natural History. | Coffee (<i>in part</i>). |
| A. Bur. | AGNES BURKE, B.S., A.M. Instructor, Teachers College, Columbia University, New York. Co-Author of <i>A Conduct Curriculum</i> . | Children's Games (<i>in part</i>). |
| A. C. C. | ALBERT CURTIS CLARK, M.A., HON. LITT.D., F.B.A. Corpus Christi Professor of Latin, Oxford University. Editor of <i>Cicero's Speeches</i> . | Cicero. |
| A. C. McG. | ARTHUR CUSHMAN MCGIFFERT, A.M., D.D., PH.D., LL.D. Professor of Church History and President of the Union Theological Seminary, New York. | Church History (<i>in part</i>). |
| A. C. W. | ALAIN C. WHITE, A.M. Author and Editor of a series of books on chess problems, known as <i>The Christmas Series</i> , published annually since 1905. | Chess: Problems. |
| A. D. I. | A. D. IMMS, M.A., D.Sc. Institute of Plant Pathology, Harpenden, Hertfordshire. Formerly Forest Zoologist to the Government of India and Professor of Biology, University of Allahabad. Author of <i>A General Textbook of Entomology</i> . | Cockroach. |
| A. D. M. | A. D. MITCHELL, D.Sc., F.I.C. Assistant Editor to the <i>Journal of the Chemical Society</i> . Assistant Examiner in Chemistry, University of London and Institute of Chemistry. | Chemical Apparatus (<i>in part</i>). |
| A. E. H. | MAJOR A. E. HODGKIN, M.C., M.A., F.I.C. The Technical Department, Imperial Chemical Industries, Ltd., London. | Chlorine. |
| A. F. | SIR ARTHUR FELL, M.A. Hon. President, House of Commons Channel Tunnel Committee, London. | Channel Tunnel. |
| A. F. MacD. | ALICE FOOTE MACDOUGALL. President, Alice Foote MacDougall Coffee Houses, Inc., New York. Author of <i>Coffee and Waffles</i> . | Coffee, Preparation of. |
| A. F. S. | ALEXANDER FAULKNER SHAND. Author of <i>The Foundation of Character</i> . | Character. |
| A. Ges. | ARNOLD GESELL, PH.D., M.D. Director of Yale Psycho-Clinic and Professor of Child Hygiene, Graduate School, Yale University. Author of <i>The Mental Growth of the Pre-school Child</i> ; <i>The Pre-school Child from the standpoint of Public Hygiene and Education</i> . | Child Psychology. |
| A. Hk. | ALBERT HAUCK, D.TH., PH.D., D.JURIS. Late Professor of Church History in the University of Leipzig. Editor of the 3rd edition of <i>Hauck-Herzog Realencyklopädie für Protestantische Theologie und Kirche</i> . Author of <i>Kirchengeschichte Deutschlands</i> . | Church History (<i>in part</i>). |
| A. H. T. | A. HAMILTON THOMPSON, M.A., HON. D.LITT., F.S.A. Professor of History in the University of Leeds. Author of <i>Historical Growth of the English Parish Church</i> ; <i>The Cathedral Churches of England</i> . | Chapel; Church (<i>in part</i>). |
| A. J. A. W. | BRIGADIER GENERAL SIR ARTHUR JOHN ALLEN-WILLIAMS, K.B.E., C.M.G., M.I.C.E. Officer of the Légion d'Honneur. | Channel Ferry. |
| A. J. G. | REV. ALEXANDER JAMES GRIEVE, M.A., D.D. Principal of Lancashire Independent College, Manchester. Lecturer in Early Church History at the Victoria University, Manchester. | Catechism. |
| A. J. Pi. | ADRIAN JOHN PIETERS, B.S., PH.D. Senior Agronomist, Bureau of Plant Industry, United States Department of Agriculture, Washington. Author of <i>Green Manuring, Principles and Practice</i> . | Clover (<i>in part</i>). |
| A. L. K. | A. L. KROEBER, PH.D. Professor of Anthropology, University of California, Berkeley, Calif. Author of <i>Zuni Kin and Clan</i> ; <i>Anthropology</i> ; etc. | Chinook. |

- A. Lo.** AUGUSTE LONGNON.
Late Professor at the Collège de France. Late Director of the Ecole des Hautes Etudes. Author of *Géographie de la Gaule au VI. Siècle*; *Documents relatifs au comté de Champagne et de Brie*; etc. } **Champagne.**
- A. L. S.** ANDRÉ L. SIMON.
Of Messrs. Pommeroy and Greno, Ltd. Author of *The Blood of the Grape; Wine and the Wine Trade*. } **Champagne Wines; Caret.**
- A. M. D.** A. M. DANIELS, B.S., E.E.
Consulting and Advisory Engineer, Washington. Author of *Steam and Hot Water Heating; Warm Air Furnace Heating*. } **Chimney (in part).**
- A. N. J. W.** A. NEVILLE J. WHYMANT, PH.D., LITT.D.
Professor of Chinese and Oriental Philosophy in Hosei University, Tokyo. Member of Council of the Asiatic Society of Japan. Sometime Davis Chinese Scholar, University of Oxford. Editorial Staff, London, 14th Edition, *Encyclopædia Britannica*. } **Clicks.**
- A. P. W.** COLONEL ARCHIBALD PERCIVAL WAVELL, C.M.G., M.C.
General Staff Officer, War Office, London. British Military Attaché on the Caucasus Front, 1916-7. General Staff Officer and Brigadier General, General Staff, with Egyptian Expeditionary Force, April 1917-21. } **Caucasus, Campaign in the.**
- A. S. E.** SIR ARTHUR STANLEY EDDINGTON, D.Sc., F.R.S.
Plumian Professor of Astronomy, Cambridge University. Director of the Observatory, Cambridge; Fellow of Trinity College, Senior Wrangler, 1904, and Smith's Prizeman, 1907. President of the Royal Astronomical Society, London, 1921-3. Author of *Stellar Movements and the Structure of the Universe*; etc. Editor of the Astronomy section, 14th Edition, *Encyclopædia Britannica*. } **Centaurus; Cetus.**
- A. Sto.** ALBERT STÖESSEL, M.A.
Conductor of New York Oratorio Society. Head of Music Department, New York University. Author of *Technique of the Baton*. Composer of *Sonata in G* (Violin and Piano); *Suite Antique for Orchestra*. } **Choral Singing (in part).**
- A. V. B.** ALBERT V. BLEININGER, B.S.
Chemist, Homer Laughlin China Co., Newell, West Virginia. Consultant, Chemical Warfare Service, United States Army, Washington. Author of *The Manufacture of Hydraulic Cements*. } **China-Clay (in part); Chinaware.**
- A. W. Kn.** A. W. KNAPP, M.Sc., F.I.C., M.I.CHEM.E.
Member of the Council of the Institute of Chemistry. Chief Chemist to Messrs. Cadbury Bros., Ltd., Bournville. Author of *The Cocoa and Chocolate Industry*. } **Chocolate; Cocoa.**
- A. W. Ma.** A. W. MAIR, LITT.D.
Late Professor of Greek, Edinburgh University. Classical Examiner to London University, 1919-23. Author of *Callimachus*; etc. } **Classics.**
- A. Wo.** ABRAHAM WOLF, M.A., D.LITT.
Professor of Logic and Scientific Method in the University of London. Sometime Fellow of St. John's College, Cambridge. Fellow of University College, London. Author of *The Oldest Biography of Spinoza*; *Textbook of Logic*. Editor of the Philosophy and Psychology section, 14th Edition, *Encyclopædia Britannica*. } **Category; Causality or Causation; Classification.**
- A. W. P.** ALFRED WILLIAM POLLARD, C.B., M.A., F.B.A., D.LITT.
Professor of English Bibliography, King's College, University of London. Editor of *English Miracle Plays; Bibliographica; English Bookman's Library and Macmillan's Library of English Classics*; etc. Author of *Fine Books; Shakespeare's Fight with the Pirates*; etc. } **Chaucer.**
- A. Y.** ALEXANDER YEWDALL.
Lecturer in the Textile Industries Department, Leeds University. } **Clothing Manufacture (in part).**
- B. A. E.** B. A. ELLIS, M.A., A.I.C.
Chemist at the Government Laboratory, Clifford's Inn Passage, London. } **Chemistry: Analytical.**
- B. E. P.** BARTHÉLEMY EDMOND PALAT.
Formerly General of Brigade in the French Army. Commanded a Division 1915-6. Author of *La Grande Guerre sur le Front Occidental; Les Batailles d'Arras et de Champagne*. } **Champagne, Battles in (in part).**
- B. H. L. H.** CAPTAIN B. H. LIDDELL HART, F.R.Hist.S.
Military Historian and Critic, Military Correspondent to the *Daily Telegraph*, London. Editor of the Military section, 14th Edition, *Encyclopædia Britannica*. } **Chemin-des-Dames.**
- B. T. P. B.** B. T. P. BARKER, M.A., HON.F.R.H.S.
Professor of Agricultural Biology at Bristol University. Director of the Agricultural and Horticultural Research Station, Somersetshire, England. } **Cider (in part).**
- B. Wi.** BASIL WILLIAMS, O.B.E.
1st Class Classical Moderations; 2nd Class Litterae Humaniores, Oxford. Professor of History at Edinburgh University. } **Chatham, William Pitt.**
- C. Bem.** CHARLES BÉMONT, D-ÈS-L., LITT.D.
French Scholar. Author of *Les Chartes des Libertés Anglaises; History of Europe 395-1270*. } **Chronicle.**
- C. Br.** CLOUDESLEY BRERETON, M.A., L-ÈS-L. (Paris).
Member of Legion of Honour; D-ès-L. (Hon.Causa), Lille University. Late Divisional Inspector to the L.C.C. Editor of the Education section, 14th Edition, *Encyclopædia Britannica*. } **Classical Education (in part).**
- C. E. P. B.** C. E. P. BROOKS, D.Sc. (Lond.), F.R.A.I.
Of the Meteorological Office, London. } **Climatic History.**
- C. E. T.** C. E. TILLEY, B.Sc., PH.D., F.G.S.
Lecturer in Petrology, University of Cambridge. } **Charnockite.**

INITIALS AND NAMES OF CONTRIBUTORS

vii

- | | | |
|-------------|---|--|
| C. F. A. | CHARLES FRANCIS ATKINSON. Major, late East Surrey Regiment. Scholar of Queen's College, Oxford. Author of <i>The Wilderness and Cold Harbour</i> . | } Castle (<i>in part</i>). |
| C. G. Do. | CLAUDE GORDON DOUGLAS, C.M.G., M.C., B.Sc., D.M., F.R.S. Fellow and Tutor in Natural Science, St. John's College, Oxford. Temporary Lieut. Colonel R.A.M.C., 1918. Author of papers on respiration and kindred physiological subjects in scientific journals. | } Chemical Warfare (<i>in part</i>). |
| C. J. | C. JAMES. Professor, University of New Hampshire, Durham, New Hampshire. | } Cerium. |
| C. J. J. F. | CHARLES J. J. FOX, PH.D., D.Sc., F.I.C. Of Messrs. Cross and Bevan, Consulting and Analytical Chemists, London. Formerly Principal and Professor of Physical Chemistry in the Royal Institute of Science, Bombay. | } Cellulose. |
| C. Le. | CAL LEWIS. <i>The Manufacturing Clothier</i> , New York. | } Clothing Manufacture (<i>in part</i>). |
| C. L. T. B. | C. L. T. BEECHING. Secretary, Institution of Certified Grocers, London. | } Coffee (<i>in part</i>). |
| C. M. E. M. | CHARLES MARIE EMANUEL MANGIN, K.C.B. General, Commanding the French V., VI. and X. Armies, 1916-8, and the French Forces in Rhineland, 1918-9. Formerly Member of the Supreme War Council and Inspector General of Colonial Forces. | } Champagne, Battles in (<i>in part</i>). |

| D. D. P. | D. D. PRATT, M.A., PH.D. Chemical Research Laboratory, Teddington, Middlesex. | } Coal Tar. |
| D. F. T. | DONALD F. TOVEY, MUS.DOC. Reid Professor of Music in Edinburgh University. Author of <i>Essays in Musical Analysis</i> comprising the <i>Classical Concerto, the Goldberg Variations</i> ; etc. Editorial Adviser, Music section, 14th Edition, <i>Encyclopædia Britannica</i> . | } Chamber Music; Cherubini; Chorale. |
| D. M. B. | DOROTHY M. BROOME, M.A., PH.D. Formerly Jones Fellow in the University of Manchester. | } Chamber, The King's. |

- D. M. S. W. DAVID MEREDITH SEARES WATSON, M.Sc., F.R.S.
Jodrell Professor of Zoology and Comparative Anatomy, University College, University of London. Author of many papers on Vertebrate Palaeontology and connected subjects in *Proceedings of the Zoological Society*; *Journal of Anatomy*; etc.
- D. S. M. PRINCE MIRSKY.
Lecturer in Russian Literature, King's College, London. Author of *Modern Russian Literature*; *Pushkin*; *Russian Literature, 1875-1925*.
- E. A. CAPTAIN EDWARD ALTHAM, C.B., R.N.
Secretary and Chief Executive Officer, Royal United Service Institution since 1927. Secretary and Editor of the Journal of the Royal United Service Institution. Editor of the Naval section, 14th Edition, *Encyclopædia Britannica*.
- E. A. B. E. A. BARBER, M.A.
Dean, Senior Tutor and Fellow of Exeter College, Oxford.
- E. A. Mi. EDWARD ARTHUR MILNE, M.B.E., M.A., M.Sc., F.R.S.
Rouse Ball Professor of Mathematics, Oxford.
- E. Ar. EDWARD ARMSTRONG, M.A., F.B.A.
Late Fellow of Queen's College, Oxford. Formerly University Lecturer in Modern History, Oxford. Author of *The Emperor Charles V.*; etc.
- E. B. C. E. BERESFORD CHANCELLOR, M.A., F.R.HIST.S.
Author of *The London of Charles Dickens*; *The Clubs of London, Past and Present*.
- E. C. B. THE RT. REV. EDWARD CUTHBERT BUTLER, O.S.B., D.LITT.
Abbot of Downside Abbey, Bath, 1906-22.
- E. D. A. E. D. ADRIAN, M.D., F.R.S.
Lecturer in Physiology in the University of Cambridge.
- E. E. H. EDWARD EVERETT HALE.
American writer. Author of *The Man Without a Country*.
- E. E. L. E. E. LONG, C.B.E.
Foreign Office as Officer in Charge Eastern Section, News Department, 1918-21. Special Correspondent, 1924-5.
- E. Gr. ERNEST ARTHUR GARDNER, LITT.D.
Formerly Yates Professor of Archaeology, University College, London. Vice Chancellor of the University of London, 1924-6. Author of *The Art of Greece*; *Religion and Art in Ancient Greece*; etc.
- E. Ho. E. HOLMES, PH.D., A.I.C.
- E. I. J. E. IBBETSON JAMES, O.B.E., M.A.
Sometime British Consul Officer, Allied Supreme Economic Council. Late Member of Secretariat of League of Nations and International Labour Office, Geneva. Editorial Staff, London, 14th Edition, *Encyclopædia Britannica*.
- E. Ja. EDGAR JADWIN, HON.D.E.
Major General, Chief of Engineers, United States Army, Washington.
- E. K. R. ERIC KEIGHTLEY RIDEAL, M.B.E., D.Sc., PH.D., F.I.C.
Owen Jones Lecturer in Physical Chemistry and Fellow of Trinity Hall, Cambridge. Author of *Electrometallurgy*; *Catalysis in Theory and Practice* (in part); *Water Supplies*; etc.
- E. L. W. E. L. WOODWARD, M.A.
Lecturer in History and Tutor at New College, University of Oxford.
- E. M. B. EDITH M. BARBER, M.S.
Consultant and Writer, *Pictorial Review*, and Editor of Food Column, *New York Sun*. Co-author of *Nutrition in Health and Disease*.
- E. P. N. EDWIN P. NORWOOD.
Author. Formerly in charge of Publicity for Ringling Bros. Author of *The Other Side of the Circus*; *The Adventures of Diggelby Dan*.
- E. Sa. E. SAPIR, A.M., PH.D.
Professor of Anthropology and General Linguistics, University of Chicago. Author of *Language, an Introduction to the Study of Speech*; *Time Perspective in Aboriginal American Culture*; etc.
- E. S. P. H. EDMUND SIDNEY POLLOCK HAYNES.
Author of *The Decline of Liberty in England*; *The Case for Liberty*; etc.
- E. W. Y. E. W. YEOMAN.
Technical Manager, Sensible Heat Distillation, London.
- F. C. Bi. REAR ADMIRAL FREDERICK C. BILLARD.
Commandant, United States Coast Guard, Treasury Dept., Washington.
- F. Fr. F. FRANCIS, D.Sc., PH.D., F.I.C.
Pro-Vice Chancellor and Professor of Chemistry, University of Bristol. Author of memoirs on chemical subjects, chiefly organic, published in the journals of the English and German chemical societies.
- F. H. FRED HORNER.
Consulting Engineer. Contributor to *The Times Engineering Supplement*, London; *Engineering*; *Machinery*.
- F. H. Ha. FREDERICK HENRY HATCH, O.B.E., PH.D., M.I.C.E.
Past President, Institute of Mining and Metallurgy. Adviser on Metalliferous Mining to the Mines Dept. Author of *The Mineral Resources of Natal* (Report to Natal Government); *The Past, Present and Future of the Gold Mining Industry of the Witwatersrand, Transvaal*; etc.
- F. J. H. D. F. J. HARVEY DARTON.
Sometime Scholar of St. John's College, Oxford.

Chameleon;
Cobra.

Chekhov, Anton.

Chile (in part);
China (in part);
Coast Defence (in part).

Catullus, Gaius Valerius.

Chromosphere.

Charles V.

Clubs (in part).

Clara, Saint.

Chronaxie.

Clarke, James Freeman.

Celebes;
Ceram.

Clazomenae.

Chemistry (in part).

Chesterton, G. K.;
Chevalier, Albert.

Champlain, Lake.

Catalysis.

Chalons-sur-Marne (in
part).

Cereals (in part).

Circus (in part).

Central and North American
Languages.

Civil Liberty (in part).

Chemistry: Gas Analysis.

Coast Guard (in part).

Chemistry: Organic (in part).

Clutch.

China-Clay (in part).

Children's Books (in part).

INITIALS AND NAMES OF CONTRIBUTORS

THE ENCYCLOPÆDIA BRITANNICA

FOURTEENTH EDITION

VOLUME 5 CAST-IRON TO COLE

CAST-IRON. It is said that cast-iron was first made in Sussex as early as the year 1350, but it was not until the end of the Tudor period that the practice of iron-founding was introduced into England from the continent of Europe where it had already been considerably developed. Although cast-iron and pig-iron have the same chemical composition, the expression cast-iron is generally applied to pig-iron which has been remelted in a crucible, or furnace, and cast into moulds.

Classification.—Cold- and hot-blast irons (*see* PIG-IRON) are divided, according to their content in phosphorus, into two main groups: (a) Hematite and (b) Basic irons. The former contain only small percentages of this element, about 0.7%, while in the latter the phosphorus may reach as much as 3%. Each of these main groups is again subdivided into at least six grades, Nos. 1, 2, 3, foundry, forge, and white irons. In passing along the series from "No. 1" to "White" the percentages of silicon and manganese gradually decrease, while those of combined carbon and sulphur increase. Hence it is possible, by mixing irons from different groups, to obtain cast-iron of almost any desired composition, due allowance being made for the changes which occur during remelting. Iron may be classified also according to (a) the method of manufacture; (b) the purpose for which it is intended; and (c) its composition. It was formerly graded by breaking the pig and examining the fracture, but this method has been largely superseded by chemical analysis.

(a) Method of Manufacture:

1. Coke Pig is smelted with coke; always with hot blast.
2. Charcoal Pig is smelted with charcoal, by hot or cold blast.

(b) Purpose for Which Intended:

3. Bessemer Pig.
4. Basic Open Hearth Pig.
5. Malleable Pig, for malleable cast-iron castings.
6. Foundry Pig.
7. Forge Pig is an inferior grade used for puddling and for some classes of foundry work.

(c) Chemical Composition:

8. Silicon Pig or High Silicon Pig.
9. Low Phosphorus Pig.
10. Special Low Phosphorus Pig.
11. Ferro-Alloys and Special Cast Irons (*e.g.*, ferro-manganese).

When pig-iron is melted under conditions which permit of the

oxidation of the silicon, as in the cupola and reverberatory furnace, an iron which presents a greyish fracture when broken, and is quite soft and easy to machine, will on continued remelting ultimately become white and intensely hard. Conversely, by melting white iron with increasing quantities of siliceous pig-iron it is possible to convert the white into grey iron. These differences in appearance arise from changes in the condition of the carbon. Cast-iron contains upwards of 1.5% carbon, which in very grey iron is almost wholly in the graphitic state; this condition arises from the presence of large amounts of silicon, an element which has the property of decomposing carbide of iron (Fe_3C) into its constituents, iron and carbon. As the silicon is oxidized by remelting, more and more of the carbon combines with the iron, until ultimately, in white iron, carbon in the form of graphite is entirely absent. Manganese also is oxidized during remelting, while sulphur on the other hand is absorbed from the fuel.

Grades Commonly Used.—The following are examples of the grades in common use: For thin ornamental work, such as grates, stoves, hollow ware, and other light castings, where in order to fill the mould great fluidity is required, a mixture of irons containing from 2.5% to 2.8% silicon and from 1.3% to 1.5% phosphorus is in common use; but in medium-sized castings and general work, where somewhat greater strength is required, iron containing a greater percentage of combined carbon and a reduced silicon content is necessary; and as strength rather than extreme fluidity is the main consideration, the phosphorus also may be reduced. For use in this connection irons containing silicon from 2% to 2.25% and phosphorus from 1% to 1.3% are suitable. Where still greater strength is required, as in machinery castings, phosphorus and silicon are still further reduced, and a mixture of irons yielding an average content in silicon and phosphorus respectively of 1.5% to 1.2% and 0.4% to 0.6% is employed. In cases where castings have to resist wear, and have at the same time to machine with a highly polished surface, a very close grained iron is necessary, this condition being provided by an admixture of refined and cold-blast irons with an average silicon content of from 1% to 1.3%, and about 0.45% to 0.70% phosphorus. So far, only castings of the same physical properties throughout have been considered; for some classes of work, however, such as rolls used in the sheet metal industries and some types of car wheels, it is necessary to have an intensely hard surface and a soft interior in one and the same casting. This is obtained by taking advantage of the fact that given a suitable grade

of iron, it is possible by rapid cooling to retain the carbon in the outside portion of the casting in the combined condition. This process is known as "chill casting" and the parts of the mould where the metal is to be hardened are made of iron instead of sand, so that, when the molten metal comes in contact with them heat is so rapidly extracted from it that the separation of graphite is prevented, and the carbon retained in the combined condition; while towards the centre of the casting, where the rate of cooling is not so rapid, decomposition of the cementite can take place, and in consequence the iron in this region is quite soft. In this class of work the selection of the pig-iron is of the greatest importance, slight differences in composition having very marked influences on the depth to which the hardening effect penetrates. Iron for chill casting should be low in phosphorus, and silicon also should not be too high, or the carbon will not remain in combination. About 1.5% of silicon is probably best, but opinion is not unanimous on this point.

Malleable Cast-Iron.—Ordinary cast-iron is melted readily and easily cast into any desired shape, but it has the disadvantage that castings so made are relatively weak and brittle. It is possible, however, by making use of the facility with which carbide of iron can be split up into its constituents, to make castings which are stronger than ordinary cast-iron ones, and yet possess a considerable degree of ductility, almost approaching wrought-iron in this respect, though unlike forgings of the latter metal they cannot be welded, except by the "bronze rod" process, and at a temperature below the melting point of iron. Castings made in this way are called "malleable cast-iron castings," or shortly "malleable castings." The process has been in use for many years, having been described by Reaumur in 1722. For the production of castings by this method a refined hematite pig-iron is used containing from 2.5% to 3.0% carbon and from 0.5% to 1.0% silicon (the lower figure for large, and the higher one for small castings), and having as little as possible of sulphur, phosphorus, and manganese. Sulphur is supposed to promote the formation of blow-holes, but it has been found that 0.25% may be present without ill effect. Silicon and manganese prevent the castings being converted; while an excess of phosphorus causes brittleness in the finished casting. The castings, when removed from the moulds, are extremely brittle, on account of the nature of the pig-iron used, and when broken present a white fracture; they are packed in boxes containing red hematite ore and then annealed for a period of four or five days at a temperature of 800° to 900° C. After this treatment they present a grey fracture and can be readily dressed with a file or chisel; they will also admit of a considerable amount of deformation without fracture. The process described is the one followed in Europe. In America, where the decomposition of the carbide of iron, not the direct oxidation of the carbon, is regarded as the chief essential in the process of conversion, the annealing of the castings is carried out in a slightly different manner. They are packed in boxes containing sand or clay with or without admixture of oxide, and annealed at a temperature rather lower than that used in European practice, viz., 700° to 800° C. By either method a malleable casting is obtained, but the products of each when broken present a very different appearance and are designated "white heart" and "black heart" castings respectively, terms which explain themselves.

Since about 1850 the use of cast-iron for structural purposes has been gradually superseded by steel, but so many other applications have been found for it, that it is still in considerable demand, as it is the cheapest form of commercial iron. Its tensile strength, though considerably less than that of steel, is ample for many purposes, while in compression its strength is greater than that of any other known metal.

See E. L. Rhead *The Principles and Practice of Ironfounding* (Manchester, 1910); T. Turner *The Metallurgy of Iron* (5th ed. 1918); W. H. Hatfield *Cast-iron in the Light of Recent Research* (2nd ed. 1918); H. A. Schwartz *American Malleable Cast Iron*; Richard Moldenke *The Principles of Iron Founding*. (T. BA.)

CASTLE, a small self-contained fortress, usually of the middle ages, though the term is sometimes used of prehistoric earthworks (e.g., Hollingbury castle, Maiden castle), and sometimes of citadels (e.g., the castles of Badajoz and Burgos) and small de-

tached *forts d'arrêt* in modern times. It is also often applied to the principal mansion of a prince or nobleman, and in France (as *château*) to any country seat. Under its twofold aspect of a fortress and a residence, the mediaeval castle is inseparably connected with the subjects of fortification (see FORTIFICATION AND SIEGECRAFT) and architecture. For an account of Roman and pre-Roman *castella* in Britain see BRITAIN.

Mediaeval Castles.—The word "castle" (*castel*) was introduced into English shortly before the Norman Conquest to denote a type of fortress, then new to the country, brought in by the Norman knights summoned by Edward the Confessor to defend Herefordshire against the inroads of the Welsh. The essential feature of this type was a circular mound of earth surrounded by a dry ditch and flattened at the top. Around the crest of its summit was placed a timber palisade. This moated mound was styled in French *motte* (latinized *mota*). It is clearly depicted in the Bayeux tapestry, and was then familiar on the mainland of western Europe. A description of this earlier castle is given in the life of John, bishop of Terouanne (*Acta Sanctorum*, quoted by G. T. Clark, *Mediaeval Military Architecture*):—"The rich and the noble of that region being much given to feuds and bloodshed, fortify themselves . . . and by these strongholds subdue their equals and oppress their inferiors. They heap up a mound as high as they are able, and dig round it as broad a ditch as they can. . . . Round the summit of the mound they construct a palisade of timber to act as a wall. . . . Inside the palisade they erect a house, or rather a citadel, which looks down on the whole of the neighbourhood." St. John, bishop of Terouanne, died in 1130, but this castle of Merchem may be taken as typical of the practice of the 11th century. In addition to the mound, the citadel of the fortress, there was often appended to it a bailey or basecourt (see BAILEY), and sometimes two, of semilunar or horseshoe shape, so that the mound stood *à cheval* on the line of the enceinte. The rapidity and ease with which it was possible to construct castles of this type made them characteristic of the Conquest period in England. In later days a stone wall replaced the timber palisade and produced what is known as the shell-keep, as in the castles of Berkeley, Alnwick and Windsor.

The Normans introduced also two other types of castle, the one where they found a natural rock stronghold which only needed adaptation, as at Clifford, Ludlow, the Peak and Exeter, to produce a citadel; the other a wholly distinct type, the high rectangular tower of masonry, of which the Tower of London is the best-known example. This type belongs rather to the more settled conditions of the 12th century when speed was not a necessity, and in the first half of which the fine extant keeps of Hedingham and Rochester were erected. These towers were originally surrounded by palisades, usually on earthen ramparts, which were replaced later by stone walls. The whole fortress thus formed was styled a castle, but sometimes more precisely "tower and castle," the former being the citadel, and the latter the walled enclosure, thus preserving the meaning of the Roman *castellum*. Reliance was placed by the engineers of that time simply on the inherent strength of the structure, the walls of which defied the battering-ram, and could only be undermined at the cost of much time and labour, while the narrow apertures were constructed to exclude arrows or flaming brands.

Influence of the Crusades.—At this stage the crusades, and the consequent opportunities afforded to western engineers of studying the solid fortresses of the Byzantine empire, revolutionized the art of castle-building, which henceforward follows recognized principles. Many castles were built in the Holy Land by the crusaders of the 12th century, and it has been shown (Oman, *Art of War: the Middle Ages*, p. 529), that the designers realized, first, that a second line of defences should be built within the main enceinte, and a third line or keep inside the second line; and secondly, that a wall must be flanked by projecting towers. From the Byzantine engineers, through the crusaders, we derive, therefore, the cardinal principle of the mutual defence of all the parts of a fortress. The *donjon* of western Europe was regarded as the fortress, the outer walls as accessory defences; in the East each envelope was a fortress in itself, and the keep became merely the

PHOTOGRAPH BY EWING GALLOWAY

CASTLE OF NEUSCHWANSTEIN, BAVARIA

This castle, situated on a sharp promontory in the foothills of the Alps, was designed for Ludwig II of Bavaria in 1869 by Dollmann, Riedel and Hofmann, who followed the design of the castle of Wartburg as closely as the site permitted. Neuschwanstein is built on the foundations of a mediaeval castle, Von der Hohenschwangau. It is a copy of the type evolved in the middle ages in mountain regions where the small space on the hilltops made necessary high buildings with diminished inner courts or wards. The main entrance is at the extreme right; further left are an outer and an inner court, and at the extreme left rises the main body of the castle, with round lookout tower commanding a view of the surrounding country

PHOTOGRAPHS, (1) AEROFILMS LTD., (2) AEROFILMS LTD., FROM EWING GALLOWAY

TWO CASTLES OF GREAT BRITAIN

1. Windsor castle, a fortified spot since the early 11th century and a royal residence from the time of William the Conqueror. The round mound and ditch encircling the present round tower go back to the earliest building. In its present form, however, the castle dates largely from the time of Henry III., who built the first masonry structure (c. 1270), and Edward III., who almost entirely reconstructed it in 1344, as a meeting place for the Knights of the Garter. From that time on it has been continuously added to and improved—St. George's chapel, dating from 1473 to 1507; the Albert Memorial chapel, largely from 1501–03, (although the interior was much altered by Sir Gilbert Scott under Queen Victoria as a memorial to the prince consort) and the state apartments and residence quarters in the upper ward (to the right) from a reconstruction under George IV. and Queen Victoria, from designs by Sir Jeffrey Wyattville, who also increased the height of the old keep—the round tower near the centre. The oldest part of the existing castle is the round bell tower

at the extreme left, with its high roof of French type, which dates from the time of Henry III. The greater part of the more recent construction having been built on foundations of older work, the whole presents an unusually vivid picture of what mediaeval castles of the largest type must have been in their prime

2. Carnarvon castle, Wales. Much smaller than Windsor, this also retains its ancient appearance. It was begun in 1283–84 by Edward I., from designs by his famous castle architect, Henry de Elreton, and was one of a chain of castles, including Conway and Beaumaris, intended for the pacification of the Welsh. Carnarvon was not completed until the reign of Edward II. Originally, a wall in the centre of the enclosed area divided it into two wards. The towers are of the British polygonal type. In France, at the time, round towers had become common. Despite the destruction of the interior residential buildings, Carnarvon castle is among the best preserved of those in the British Isles

last refuge of the garrison. Indeed, the keep, in several crusader castles, is no more than a tower, larger than the rest, built into the enceinte and serving for its flanking defence, while the fortress was made strongest on the most exposed front. The idea of the flanking towers soon penetrated to Europe, and Alnwick castle (1140-50) shows the influence of the new system. The finest of all castles of the middle ages was Richard Coeur de Lion's Château Gaillard (1197) on the Seine near Les Andelys. Here the innermost ward was protected by an elaborate system of strong defences, which included a *tête-de-pont* covering the Seine bridge. The castle stood upon high ground and consisted of three distinct enceintes or wards besides the keep, which was in this case merely a strong tower forming part of the innermost ward. Round instead of rectangular towers gradually became more usual, the finest examples of their employment as keeps being at Conisborough in England and at Coucy in France. Against the feeble siege artillery of the 13th century a well built fortress was

almost proof, but the mines and the battering ram were more formidable, and it was realized that corners in the stonework of the fortress were more vulnerable than a uniform curved surface. Château Gaillard fell to Philip Augustus in 1204 after a strenuous defence, and the success of the assailants was largely due to the skilful employment of mines. An angle of the noble keep of Rochester was undermined and brought down by John in 1215.

The Concentric Plan.—The next development was the extension of the principle of successive lines of defence to form what is called the "concentric" castle, in which each ward was placed wholly within another which enveloped it; places thus built on a flat site (e.g., Caerphilly castle) became for the first time more formidable than strongholds perched upon hills such as Château Gaillard, where, although the more exposed parts possessed many successive lines of defence, at other points, for want of room, it was impossible to build more than one or, at most, two walls. In these cases, the fall of the inner ward by surprise, escalade or

regular siege (as was sometimes feasible), entailed the fall of the whole castle. The adoption of the concentric system precluded any such mischance, and thus, even though siege-engines improved during the 13th and 14th centuries, the defence maintained itself superior to attack during the latter middle ages. Its final fall was due to the introduction of gunpowder. "In the 14th century the change begins, in the 15th it is fully developed, in the 16th the feudal fastness has become an anachronism."

Decline of Baronial Fortifications.—The general adoption of cannon placed in the hands of the central power, a force which ruined the baronial fortifications. The possessors of cannon were usually private individuals of the middle classes, from whom the prince hired the *matériel* and the workmen. A typical case will be found in the history of Brandenburg and Prussia (Carlyle, *Frederick the Great*, bk. iii.; ch. i.), the castle of Friesack, held by an intractable feudal noble, Dietrich von Quitzow, being reduced in two days by the elector Frederick I. with "Heavy Peg" (*Faule Grete*) and other guns (Feb. 1414). In England, the earl of Warwick in 1464 reduced the strong fortress of Bamborough in a week, and in Germany, Franz von Sickingen's stronghold of Landstuhl, formerly impregnable on its heights, was ruined in one day by the artillery of Philip of Hesse (1523). Heavy artillery was used for such work, of course, and against lighter natures, some castles and even fortified country-houses managed to make a stout stand as late as the Great Rebellion in England.

The castle thus ceases to be the fortress of small and ill-governing local magnates, and its later history is merged in that of modern fortification. But an interesting transitional type between the mediaeval stronghold and the modern fortress is found in the coast castles erected by Henry VIII., especially those at Deal, Sandown and Walmer (c. 1540). Walmer castle is still the official residence of the lord warden of the Cinque Ports. Viollet-le-Duc, in his *Annals of a Fortress* (English trans.), gives a full and interesting account of the repeated renovations of the fortress on his imaginary site in the valley of the Doubs, the construction by Charles the Bold of artillery towers at the angles of the castle, the protection of the masonry by earthen outworks and boulevards and, in the 17th century, the final service of the mediaeval walls and towers as a pure *enceinte de sûreté*. Here and there we find old castles serving as *forts d'arrêt* or block-houses in mountain passes and in some few cases, as at Dover, they formed the nucleus of purely military places of arms, but normally the castle falls into ruins, becomes a peaceful mansion, or is merged in the fortifications of the town which has grown up around it. In the *Annals of a Fortress* the site of the feudal castle is occupied by the citadel of the walled town. The baronial "castle" assumes *pari passu* the form of a mansion, retaining indeed some capacity for defence, but in the end losing all military characteristics save a few which survived as ornaments. Examples of such castellated mansions are seen in Wingfield Manor, Derbyshire, and Hurstmonceaux, Sussex, created in the 15th century. Many older castles which survived were altered to serve as residences. (C. F. A.)

Castles in English History.—Such strongholds as existed in England at the time of the Norman Conquest seem to have offered but little resistance to William the Conqueror, who, in order effectually to guard against invasions from without as well as to awe his newly-acquired subjects, immediately began to erect castles all over the kingdom, and likewise to repair and augment the old ones. Besides, as he had parcelled out the lands of the English amongst his followers, they, to protect themselves from the resentment of the despoiled natives, built strongholds and castles on their estates, and these were multiplied so rapidly during the troubled reign of King Stephen that the "adulterine" (*i.e.*, unauthorized) castles are said by one writer to have amounted to 1,115.

In the first instance, when the interest of the king and of his barons was identical, the former had only retained in his hands the castles in the chief towns of the shires, which were entrusted to his sheriffs or constables. But the great feudal revolts under the Conqueror and his sons showed how formidable an obstacle to the rule of the king was the existence of such fortresses in private hands, while the people hated them from the first for the oppres-

sions connected with their erection and maintenance. It was, therefore, the settled policy of the Crown to strengthen the royal castles and increase their number, while jealously keeping in check those of the barons. But in the struggle between Stephen and the empress Maud for the crown, which became largely a war of sieges, the royal power was relaxed and there was an outburst of castle-building by the barons. These in many cases acted as petty sovereigns, and such was their tyranny that the native chronicler describes the castles as "filled with devils and evil men." These excesses paved the way for the pacification at the close of the reign, when it was provided that all unauthorized castles constructed during its course should be destroyed. Henry II., in spite of his power, was warned by the great revolt against him that he must still rely on castles, and the massive keeps of Newcastle and of Dover date from this period.

Under his sons the importance of the chief castles was recognized as so great that the struggle for their control was in the forefront of every contest. When Richard made vast grants at his accession to his brother John, he was careful to reserve the possession of certain castles, and when John rose against the king's minister, Longchamp, in 1191, the custody of castles was the chief point of dispute throughout their negotiations, and Lincoln was besieged on the king's behalf, as were Tickhill, Windsor and Marlborough subsequently, while the siege of Nottingham had to be completed by Richard himself on his arrival. To John, in turn, as king, the fall of Château Gaillard meant the loss of Rouen and of Normandy with it, and when he endeavoured to repudiate the newly-granted Great Charter, his first step was to prepare the royal castles against attack and make them his centres of resistance. The barons, who had begun their revolt by besieging the castle of Northampton, now assailed that of Oxford and seized Rochester castle. The king recovered Rochester after a severe struggle and captured Tonbridge, but thenceforth there was a war of sieges between John with his mercenaries and Louis of France with his Frenchmen and the barons, which was especially notable for the great defence of Dover castle by Hubert de Burgh against Louis. On the final triumph of the royal cause, after John's death, at the battle of Lincoln, the general pacification was accompanied by a fresh issue of the Great Charter in the autumn of 1217, in which the precedent of Stephen's reign was followed and a special clause inserted that all "adulterine" castles, namely those which had been constructed or rebuilt since the breaking out of war between John and the barons, should be immediately destroyed. And special stress was laid on this in the writs addressed to the sheriffs.

In 1223 Hubert de Burgh, as regent, demanded the surrender to the Crown of all royal castles not in official custody, and though he succeeded in this, Falkes de Breauté, John's mercenary, burst into revolt next year, and it cost a great national effort and a siege of nearly two months to reduce Bedford castle, which he had held. In the Barons' War (*q.v.*) castles again asserted their importance. The Provisions of Oxford included a list of the chief royal castles and of their appointed castellans with the oath that they were to take; but the alien favourites refused to make way for them till they were forcibly ejected. When war broke out it was Rochester castle that successfully held Simon de Montfort at bay in 1264, and in Pevensey castle that the fugitives from the rout of Lewes were able to defy his power. Finally, after his fall at Evesham, it was in Kenilworth castle that the remnant of his followers made their last stand, holding out nearly five months against all the forces of the Crown, till their provisions failed them at the close of 1266.

Thus for two centuries after the Norman Conquest castles had proved of primary consequence in English political struggles, revolts and warfare. And, although, when the country was again torn by civil strife, their military importance was of small account, the crown's historic jealousy of private fortification was still seen in the need to obtain the king's licence to "crenellate" (*i.e.*, embattle) the country mansion.

TYPES OF FEUDAL CASTLES

1. Alcazar at Segovia, built by Henry IV. of Castile (1454-74). This castle, placed for defence on a high, narrow plateau, served not only as the king's residence but also as the stronghold of the city walls. It is characteristic of the castle form which grew out of the combined military and residential requirements of the feudal period
2. The Bavarian royal castle of Neuschwanstein (shown also in Plate I), although modern, accurately represents the type of castle building developed in the hills of Germany in the middle ages. It is a product of the German Romantic Movement, built for Ludwig II. to rival the castle of Wartburg, whose design it closely follows
3. Rochester castle, Kent, the great square keep, 120 feet high, all that remains of the original castle, which was probably built before 1126, by William de Corbeil, archbishop of Canterbury. (It belongs to the type of square Norman castle keep, illustrated also by the Tower of London)
4. Castella Coca, Spain, built soon after 1473. Like Alcazar at Segovia, it is one of a chain of fortifications built by the kingdom of Castile during the reconquest of Spain from the Moors. Its warm red brick walls and projecting turrets belong to the style called *Mudejar*, which was developed by Moorish workmen under Christian supervision. The battlements are of the Moorish type
5. Walls of the citadel of Carcassonne, dating from the 13th and early 14th centuries, as restored under the direction of Viollet-le-Duc in the middle of the 19th century. The restoration gives an idea of the original appearance of a great mediaeval castle, of which the high, unbroken, battlemented walls and projection towers, either square with battlements or round with conical roofs, are characteristic features
6. Castle of Vajda Hunyadi in Hungary, showing characteristics similar to castles in western Europe. The projection of the upper part of the towers—machicolation—enabled defenders to discharge missiles directly upon the attackers below. The buildings shown in this picture date chiefly from about 1400 with parts of the residence portion of a later date
7. Palace of the Prince of Monaco. 17th century castle as restored

H. R.)

CASTLEBAR, urban district and county town of Co. Mayo, Ireland, on the river and near the lough of same name. Pop. (1926) 4,256. The castle belonged to the De Burgh family but the town was founded in the reign of James I. and received a charter in 1613. In 1641 the castle fell to the royalists. The town was held for a short period in 1798 by the French. Four miles north-east is a round tower 70 ft. high and 57 ft. in circumference. Trade is in linen goods and agricultural produce.

CASTLECONNELL, a village of Co. Limerick, Ireland, on the left bank of the Shannon, 18 m. S.E. of Limerick on the Great Southern railway. There are remains of a castle from which the town took its name, which was the seat of the kings of Thomond. It was destroyed in 1690. Castleconnell is a centre for the salmon fishing of the lower Shannon.

CASTLE DONINGTON, a town of north Leicestershire, England, 11 m. S.W. of Nottingham on the L.M.S.R. Pop. rural dist. (1931) 6,491. It lies on the flank of the hills overlooking the Trent and Soar valleys. There are slight remains of the castle. The church of St. Luke is a fine building of Early English and later date. Hosiery, silk and baskets are manufactured.

CASTLE DOUGLAS, burgh of barony, Kirkcudbrightshire, Scotland. Pop. (1931) 3,008. It is situated on Carlingwark loch, 19½ m. S.W. of Dumfries by the L.M.S.R. Its auction marts for sheep and cattle sales are the largest in the south-west of Scotland. The leading industries include the making of agricultural implements and tanning. The town is the chief centre of business in East Galloway, and it is also visited in summer for its scenery and fishing. Till 1765 it was only a village under the name of Causewayhead, but the discovery of marl in the lake brought it some prosperity, and it was purchased in 1792 by Sir William Douglas and called after him. Carlingwark loch contains several islets, on one of which is a crannog, or ancient lake dwelling.

CASTLEFORD, an urban district in the West Riding of Yorkshire, England, on the river Aire near its junction with the Calder, 9 m. S.E. of Leeds, on the L.N.E. and L.M.S. railways. Pop. (1931) 21,781. Large glass-bottle and earthenware-jar works, chemical works, and neighbouring collieries employ the inhabitants.

CASTLEGATE, a town in Carbon county, Utah; elevation 6,120 ft. above sea-level; population (1930) 923. The name "Castlegate" was taken from that of the peculiar gate-like passage in the canyon of Price river 2 m. above the town. Here projecting pinnacles of grey sandstone, 450 to 500 ft. high, close in on the valley, leaving only a narrow passage resembling a gateway in the walls of a ruined castle. The sandstone pillar on the east side of the canyon appears almost ready to fall on the passing trains of the Denver and Rio Grande Western railway, which uses the pass.

CASTLE-GUARD, an arrangement under the feudal system, by which the duty of finding knights to guard royal castles was imposed on certain baronies, and divided among their knights' fees. The greater barons provided for the guard of their castles by exacting a similar duty from their knights. In both cases the obligation was commuted very early for a fixed money payment, which, as "castle-guard rent," lasted down to modern times.

See J. H. Round, "Castle-Guard," in *Archaeological Journal*, vol. lx., and "Castleward and Coinage," in *The Commune of London*.

CASTLEMAINE, ROGER PALMER, EARL OF (1634-1705), first husband of the duchess of Cleveland (see CLEVELAND,

BARBARA, *Duchess of*), English diplomatist and author. He was an ardent Roman Catholic, who defended his co-religionists in several publications. He wrote an account in French of the war against Holland (1665-67) in which he had served; an English version of his book was published in 1671. Denounced by Titus Oates as a Jesuit he was tried and acquitted, afterwards serving James II. as ambassador to Pope Innocent XI. After James II.'s flight, his Jacobite sympathies caused him to be suspected by the Government, and his time was mainly spent either in prison or in exile. He died at Oswestry on July 21, 1705.

CASTLEMAINE, a town of Talbot county, Victoria, Australia. Pop. c. 6,500. Castlemaine's gold-mines were among the first discovered in the colony. Slate and flagstone are quarried in the district, which is also an important wine and fruit-producing area.

CASTLE PINCKNEY NATIONAL MONUMENT, a tract of 3½ ac. in South Carolina, U.S.A., set apart in 1924 as a Government reservation. It is the site of a fort which was erected in 1810 and had previously been occupied by a revolutionary fort. Castle Pinckney is administered by the War Department.

CASTLEREAGH, VISCOUNT: see LONDONDERRY, ROBERT STEWART, 2ND MARQUESS OF.

CASTLE RISING, a village of Norfolk, England, 4 m. N.E. of King's Lynn. Pop. of parish (1921) 236. The Norman castle for which it is famous stands on slightly elevated ground overlooking, to the west, the low marshy coast of the Wash. Its site is enclosed by artificial ramparts of earth and a dyke which is crossed by an ancient bridge. The keep is square and massive, and fairly perfect. In some parts, especially the entrance, the Norman carving is very rich. The foundations of a small chapel with apsidal eastern termination have been discovered outside the castle. The village of Castle Rising is the decayed remnant of a town of no little importance. Its church of St. Laurence is late Norman, with rich ornamentation; it shows traces of considerable alterations in the Early English period, but is an admirable example of the earlier style.

In Domesday Book the manor is given as having belonged to Archbishop Stigand, from whom it had passed to Odo of Bayeux, whose estates were confiscated in 1088. Granted to William de Albini, whose son built Rising castle, it passed eventually by sale to Isabel, queen of England, in 1332, remaining in the possession of the crown until Henry VIII. exchanged it for other lands with the duke of Norfolk. A mayor is first mentioned in 1343, and a borough existed in the 15th century. A survey of 1589-1590 declared that Castle Rising was an ancient borough by prescription. Castle Rising became a parliamentary borough in 1558, but was disfranchised in 1832 and the corporation abolished in 1835, although a mayor was elected for special purposes until 1833. Its fairs and markets were formerly important.

CASTLETON, a village of north Derbyshire, England, 10 m. N.E. of Buxton. Pop. of parish (1921) 646. Lying at an elevation of about 600 ft., it is surrounded on the north, west and south by steep hills rising to a height of from 1,400 to 1,700 ft. above sea-level. The district is celebrated for its caves and mines and for the ruined Castle of the Peak, placed on a cliff immediately above the village. The Peak Cavern or Devil's Hole, penetrating this cliff, is the most magnificent in Derbyshire. For many generations the entrance to this cave has served as a workshop, held free of rent, to families employed in rope and twine making. Speedwell Cavern is not far distant, at the entrance to the fine pass of Winnats, by which Castleton and the Vale of Hope are approached from the west. Among several other caves is that known as the Blue John Mine, from the decorative fluorspar called "Blue John" which is obtained here. The church of St. Edmund, Castleton, retains a fine Norman chancel arch, and the vestry contains a valuable library. The Castle of the Peak, or Peveril Castle, is famous through Sir Walter Scott's novel *Peveril of the Peak*. Early earthworks, extending from below the castle in a semi-circle, can still in great part be traced. Before the Conquest the site was held by Gernebern and Hundinc, and was granted by the Conqueror to William Peverell, by whom the castle was built. In 1216 William Ferrers, earl of Derby, took

it from the rebellious barons, and was made governor by Henry III., who in 1223 granted a charter for a weekly market at the town. In 1328 the castle was given to John of Gaunt on his marriage with Blanche of Lancaster, and thus became part of the duchy of Lancaster. The castle has often been used as a prison, and from its position was almost impregnable.

CASTLETOWN, a town of the Isle of Man (Manx. *Bully Cashtel*), 10 m. S.W. of Douglas, by the Isle of Man railway. Pop. (1921) 1,898. It lies on both sides of a small harbour formed by the outflow of the Silver Burn into Castletown Bay. It was the legal capital of the island until 1862. In the centre of the town stands Castle Rushen, said to have been founded by the Dane Guthred, in 947-960, though the existing building is probably 14th century. Until the 18th century it was the residence of the lords of Man. The massive keep is square, and is surrounded by an outer wall, with towers and a moat. The council chamber and court-house were built in 1644. In the neighbourhood of the castle is the Old House of Keys, where the members of the Manx parliament held their sessions until the removal of the seat of government to Douglas. King William's College, situated a mile to the north-east of Castletown, is the chief school in the island. A small shipping trade is maintained.

CASTOR AND POLLUX, in Greek and Roman mythology the twin sons of Leda, and brothers of Helen and Clytemnestra. They were also known as *Dioscuri* (Gr. "lads of Zeus"), for, according to later tradition, they were the children of Zeus and Leda, whose love the god had won under the form of a swan. In some versions Leda is represented as having brought forth two eggs, from one of which Castor and Pollux were born, from the other Helen. According to another account, Zeus was the father of Pollux and Helen, Tyndareus (king of Sparta) of Castor and Clytemnestra. In Homer they are said to have been the children of Tyndareus and Leda, and Helen is said to have been the daughter of Leda by Zeus. The Dioscuri were specially revered among people of Dorian race, and were said to have reigned at Sparta, where also they were buried. They were the friends of sailors, appearing in the shape of St. Elmo's fire during storms. Later, they were confounded with the Cabeiri (q.v.).

CASTOREUM, an oily viscid gland secretion contained in two pairs of membranous sacs between the anus and external genitals of both the male and the female Russian and American beaver; known also as beaver musk. After drying, it comes into commerce as more or less solid masses, of brown colour and a strong, rather disagreeable odour, due to the presence of about 2% of an essential oil, in addition to which a number of odourless organic and inorganic substances have been isolated. It was formerly used medicinally as a stimulant in hysterical affections, but at present serves almost exclusively for blending perfumes, in the same way as musk and civet, usually in the form of an alcoholic extract.

CASTOR OIL, the fixed oil obtained from the seeds of the castor oil plant or Palma Christi, *Ricinus communis*, family Euphorbiaceae. The plant is a native of tropical Africa, but is cultivated in most tropical and warmer temperate countries. Besides oil the seeds contain a powerful toxic substance (ricin) important as being, with abrin, the only vegetable substances to which antisera have been produced by immunological methods.

Much oil of excellent quality is obtained from India, Italy and California. The oil is obtained from the seeds by expression and decoction. One hundred pounds of good seeds may yield about five gallons of pure oil.

Castor oil is a viscid liquid, almost colourless when pure, with a slight odour, and a mild yet nauseous taste. Its specific gravity is 0.96 and it dissolves freely in alcohol, ether, and glacial acetic acid. It contains palmitic and several other fatty acids, but the chief is ricinoleic acid which occurs in combination with glycerin.

The active principle to which the oil owes its purgative properties has not been isolated. The dose is from a drachm to an ounce. By far the best way to administer the oil is in capsules, but it may be given in warm milk. It acts in about five hours, affecting the entire length of the bowel, but not increasing the flow of bile except in very large doses. The mode of its action is unknown.

The oil will purge when rubbed into the skin or injected *per rectum*. It is an invaluable drug in temporary constipation and whenever a mild action is essential, as in pregnancy. It is useful for children and the aged, but must not be employed in cases of chronic constipation, which it only aggravates, whilst relieving the symptoms.

CASTRATO, an adult male soprano who has been operated on in his youth to prevent his voice from changing in the ordinary way to the normal masculine pitch. In former days such singers were very numerous and included some of the most famous in the whole history of the art, such as Caffarelli, Velluti, Senesino and Farinelli, but thanks to improved public opinion the abominable practice to which they owed their existence has now been entirely abandoned. Euvrati was another name for singers of this class.

CASTREN, MATTHIAS ALEXANDER (1813-1853), Finnish ethnologist and philologist, was born at Tervola, Kemi, Finland, on Dec. 2, 1813. In 1838 he joined a medical fellow-student, Dr. Ehrström, in a journey through Lapland. In the following year he travelled in Russian Karelia; and in 1841 he undertook, in company with Dr. Elias Lönnrot, a third journey, which extended as far as Obdorsk, and occupied three years. On his return he published his *Elementa grammatices Syrjaenae* and *Elementa grammatices Tscheremissae* (1844). He then undertook an exploration of the whole government of Siberia, which resulted in a vast addition to previous knowledge, but seriously affected his health. The first-fruits of his collections were published as *Versuch einer ostjakischen Sprachlehre* (St. Petersburg, 1849). In 1850 he published a treatise *De affixis personalibus linguarum Altaicarum*, and was appointed to the new chair of Finnish language and literature at Helsingfors, next year becoming chancellor of the university. He was engaged on a Samoyedic grammar when he died on May 7, 1853.

Five volumes of his collected works appeared from 1852 to 1858, containing respectively—(1) *Reseminnen från åren 1845-44*; (2) *Reseberättelser och bref åren 1845-49*; (3) *Föreläsningar i Finsk mytologi* (Germ. trans. by A. Schiefner, 1853); (4) *Ethnologiska föreläsningar öfver Altaiska folken*; and (5) *Smärre afhandlingar och akademiska dissertationer*.

CASTRENSIS, PAULUS, an Italian jurist of the 14th century. He studied under Baldus at Perugia, and was a fellow-pupil with Cardinal Zabarella. He was admitted to the degree of doctor of civil law in the University of Avignon, but it is uncertain when he first undertook the duties of a professor. A tradition, which has been handed down by Panzirolus, represents him as having taught law for a period of 57 years. He was professor at Vienna in 1390, at Avignon in 1394, and at Padua in 1429; and, at different periods, at Florence, at Bologna and at Perugia. He was for some time the vicar general of Cardinal Zabarella at Florence, and his eminence as a teacher of canon law may be inferred from the language of one of his pupils, who styles him "famosissimus juris utriusque monarca." His most complete treatise is his readings on the *Digest*, and it appears from a passage in his readings on the *Digestum Vetus* that he delivered them at a time when he had been actively engaged for 45 years as a teacher of civil law. His death is generally assigned to 1436, but it appears from an entry in a ms. of the *Digestum Vetus*, which is extant at Munich, made by the hand of one of his pupils who styles him "praeceptor meus," that he died on July 20, 1441.

CASTRES, a town of south-western France, capital of an arrondissement in the department of Tarn, 29 m. S.S.E. of Albi. Pop. (1926) 20,815. The busiest town of its department, it has been a cloth-working centre since the 14th century. It lies on both banks of the Agout, which is fringed by old houses with projecting upper storeys.

Castres grew up round a Benedictine abbey, probably founded in the 7th century. It was a place of considerable importance as early as the 12th century, and ranked as the second town of the Albigenes. During the Albigenian crusade it surrendered to Simon de Montfort: in 1356 it was raised to a countship by King John of France, and was united to the crown by Francis I. in 1519. In the wars of the late 16th century the inhabitants sided with the Protestant party, fortified the town, and established an independent republic. They were brought to terms, however, by

Louis XIII., and forced to dismantle their fortifications; and the town was made the seat of the *chambre de l'édit*, for the investigation of the affairs of the Protestants, transferred (in 1679) to Castelnau-dary. The bishopric of Castres, established by Pope John XXII. in 1317, was abolished at the Revolution. The church and former cathedral of St. Benoît dates only from the 17th and 18th centuries. The *hôtel de ville*, which contains a museum with some fine paintings by Goya, occupies the former bishop's palace, designed by Jules Mansart in the 17th century; the Romanesque tower beside it is the only survival of the abbey. Of several old mansions the Renaissance *hôtel de Nayrac* is the most interesting. Castres has a sub-prefecture, tribunals of first instance and of commerce, a board of trade-arbitrators and a chamber of commerce. Industries include, in addition to cloth-making, metal-working, tanning, turnery and the making of wooden shoes and furniture.

CASTRO, INEZ DE (d. 1355), mistress, and perhaps wife, of Peter I. (Pedro), king of Portugal, called *Collo de Garza*, i.e., "Heron's Neck," was born in Spanish Galicia, in the earlier years of the 14th century, daughter of Don Pedro Fernandez de Castro, and Dona Aldonça Soares de Villadares, a noble Portuguese lady. Educated at the semi-Oriental provincial court of Juan Manuel, duke of Peñafiel, Inez grew up with Costança, the duke's daughter and her own cousin, who married in 1341 the infante Dom Pedro, son of Alphonso the Proud, king of Portugal. The young infanta and her cousin went to reside at Lisbon or at Coimbra, where Dom Pedro conceived that luckless passion for Inez which has immortalized them. Pedro's connection *par amours* with Inez would of itself have aroused no opposition. He might even have married her after the death of his wife in childbirth in 1345. According to his own assurance he did marry her in 1354. But by that time the rising power of the Castro family had created hatred among their rivals, both in Spain and Portugal. Alvaro Gonzales, Pedro Coelho and Diogo Lopes Pacheco persuaded the king, Alphonso, that his throne was in danger from an alliance between his son and the Castros, and urged the king to remove the danger by the murder of Inez. The old king went in secret to the palace at Coimbra, where Inez and the infante resided, accompanied by his three familiars, and by others who agreed with them. The beauty and tears of Inez disarmed his resolution, and he turned to leave her; but the men about him had gone too far to recede. Inez was stabbed to death and was buried immediately in the church of Santa Clara.

The infante had to be appeased by the concession of a large share in the Government. The three murderers of Inez took refuge in Castile. In 1357, however, Alphonso died, and the infante was crowned king of Portugal. Peter the Cruel, his nephew, surrendered the murderers. Diogo Lopes escaped, but Coelho and Gonzales were executed, with horrible tortures, in the king's presence.

The story, not authenticated, of the exhumation and coronation of the corpse of Inez has often been told. It is said that to the dead body, crowned and robed in royal raiment and enthroned beside the king, the assembled nobles of Portugal paid homage as to their queen, swearing fealty on the withered hand of the corpse. Inez was buried at Alcobaça, with extraordinary magnificence, in a tomb of white marble, surmounted by her crowned statue, destroyed by the French soldiery in 1810. From the brother of Inez, Alvaro Perez de Castro, the house of Portugal directly descended.

BIBLIOGRAPHY.—See Fernão Lopes, *Chronica del Rey Dom Pedro* (1735); Camoens, *Os Lusíadas*; Antonio Ferreira, *Inez de Castro*—the first regular tragedy of the Renaissance after the *Sofonisba* of Trissino; Luis Velez de Guevara, *Reinar despues de morir*, an admirable play; and Ferdinand Denis, *Chroniques chevaleresques de l'Espagne et du Portugal*.

CASTRO, JOÃO DE (1500–1548), called by Camoens *Castro Forte*, viceroy of the Portuguese Indies, the son of Alvaro de Castro, governor of Lisbon, served in north Africa between 1518 and 1538, soon after which date he went with his uncle Garcia de Noronha to the Indies. On arrival at Goa he volunteered for the relief of Diu. Returning to Europe, he was given command in 1543 of a fleet to clear the European seas of pirates. In 1545 he

was sent to the Indies with six sail. He defeated Mahmud king of Gujarat and the Adil Khan and relieved Diu, losing one of his sons in the battle. He then captured Broach, subdued Malacca, and in 1547 was appointed viceroy by João III. He died at Ormuz, in the arms of his friend St. Francis Xavier, on June 6, 1548. He was buried at Goa, and afterwards taken home and buried in the convent of Bemfica.

See Jacinto Freire de Andrade, *Vida de D. João de Castro* (1651), Eng. trans. by Sir Peter Wyche (1664); Diogo de Couto, *Decadas da Asia*, vi. The *Roteiros* or logbooks of Castro's voyages in the East (Lisbon, 1833, 1843 and 1872) are of great interest.

CASTROGIOVANNI, a town and episcopal see (Arab., *Kasr-Yani*, corruption of *Castrum Ennae*), in the province of Caltanissetta, Sicily, 95m. by rail S.E. of Palermo, and 56m. W. of Catania. It is situated 2,605ft. above sea-level in a strong strategic position, almost in the centre of the island, commanding a magnificent view of the interior. Pop. (1921) 26,415 (town); 32,423 (commune). Enna was one of the Sikel cities and the statement that it was colonized by Syracuse in 664 B.C. is improbable. It appears in history under Dionysius I. of Syracuse, who, after unsuccessful attempts, finally acquired possession by treachery about 397 B.C. In 134–132 it was the headquarters of the slave revolt, and was reduced only by treachery. Cicero speaks of it as a place of some importance, but in imperial times it seems to have been of little account. It was only by betrayal that the Saracens were able to take it in 859. In 1087 it fell into the hands of the Normans; and surviving fortifications are entirely mediaeval. The cathedral (1307) is of some interest. There are no remains of the famous temple of Demeter, from which Verres, as Cicero tells us, removed the bronze statue of the goddess. The lake of Pergusa, where Persephone was carried off by Hades (Pluto, Dis), lies 4m. to the south.

CASTRO URDIALES, a port of northern Spain, province of Santander, on the Bay of Biscay and terminus of a branch railway connected with the Bilbao-Santander line. Pop. (1920) 11,786. Castro Urdiales is a modern town, although its castle and parish church, on the rocky peninsula which protects the tiny bay, date from the middle ages, when it was an important fishing port. Destroyed by the French in 1813, it was quickly rebuilt and increased rapidly in population and prosperity with the development of neighbouring iron-mines and of railway communication, which took place after 1879. The port is naturally sheltered but a new artificial harbour has lately been constructed. Iron ore is by far the greatest export, but fish, especially sardines in oil, and *chacoli* wine are also important.

CASTRO Y BELLVIS, GUILLÉN DE (1569–1631), Spanish dramatist, was a Valencian by birth, and early enjoyed a reputation as a man of letters. At one time a captain of the coastguard, at another the governor of Scigliano, near Naples, Castro was nominated a knight of the order of Santiago in 1623. He settled at Madrid in 1626, and died there in such poverty that his funeral expenses were defrayed by charity. Lope de Vega dedicated to him a celebrated play entitled *Las Almenas de Toro* (1619), and when Castro's *Comedias* were published in 1618–21 he dedicated the first volume to Lope de Vega's daughter. The drama that has made Castro's reputation is *Las Mocedades del Cid* (1599?), to the first part of which Corneille was largely indebted for the materials of his tragedy. The two parts of this play, like all those by Castro, have the genuine ring of the old romances; and were among the most popular pieces of their day. Castro's *Fuerza de la costumbre* is the source of *Love's Care*, a play ascribed to Fletcher. He is also the reputed author of *El Prodigio de los Montes*, from which Calderón derived *El Mágico prodigioso*.

His *Obras* have been edited by E. J. Martínez (Madrid, 1925, etc.).

CASTRUCCIO CASTRACANI DEGLI ANTELMINELLI (1281–1328), duke of Lucca, born March 29, 1281, at Castruccio, near Lucca, was a noted *condottiere* and Ghibelline. He served under Philip IV. of France in Flanders, then with the Visconti in Lombardy, and in 1313 with Uguccione della Faggiuola, lord of Pisa, in central Italy. In 1316 he was elected lord of Lucca, and spent many years in incessant warfare against the

Florentines, whom he defeated at Altopascio in 1325, the year in which he was created duke of Lucca, Pistoja, Volterra and Luni by the emperor Louis the Bavarian. In 1327 he captured Pisa, of which he was made imperial vicar. He died Sept. 3, 1328.

BIBLIOGRAPHY.—Niccolo Machiavelli's *Life of Castruccio* is a mere romance; it was trans. into French, with notes, by Dreux de Radier in 1753. See F. Winkler, *Castruccio, Herzog von Lucca* (1897).

CASTRUM MINERVAE, an ancient town of the Sallentini in Calabria, rom. S. of Hydruntum (mod. Otranto), with an ancient temple of Minerva, said to have been founded by Idomeneus, who formed the tribe of the Sallentini from a mixture of Cretans, Illyrians and Italian Locrians. It is also said to have been the place where Aeneas first landed in Italy, the port of which he named *Portus Veneris*.

CAST STEEL: see CRUCIBLE CAST STEEL.

CASUAL LABOUR, a term frequently used to describe the discontinuous and irregular employment which at certain times of the year is experienced in trades such as building, and in this somewhat loose sense of the term, casual labour is to be found in nearly every trade in proportions which vary with the unemployment situation in general, and the state of the industry itself in particular. The casual worker, however, with whom this article is primarily concerned is the man whose employment normally, and not only periodically, consists of a succession of jobs of short duration, whose contract of engagement is by the day or even by the hour, and who, from the method by which he is engaged, may be uncertain in the morning whether work will be available in the afternoon. He is typified in the casual labourer at the docks. It is in this industry and the ancillary transport trades, and in ship-repairing, that casualization is most extensive. The nature of the problem may conveniently be illustrated by the conditions under which the dock labourer is employed.

These conditions have their origin in the day-to-day variations in the amount of loading and unloading which has to be done at the docks. Trade movements in general, and seasonal causes such as the periodical arrival of staple imports like wool and timber, may influence the extent of these variations, but their intensity is mainly due to the natural uncertainties, accentuated by the vagaries of wind, weather and tide, associated with the arrivals and departures of ships. One vessel may just manage to catch a tide and afford employment for two or three hundred men; another may be held up by a sudden fog, leaving workless the anxious crowd of men who had carefully followed its progress up the river. From causes such as these the daily volume of work at the docks fluctuates to such an extent as to become almost unpredictable.

It is obvious that to meet a varying load of this sort a large reserve of labour is required, but the extent to which this reserve must necessarily be larger than that of most industries is not so apparent without a prior idea of the general layout of most dock areas. The expression "the Port of London," or "the Port of Liverpool" tends to obscure the fact that these areas consist of a number of separate docks and separate wharves, stretching for some miles on both banks of the river, between many of which there are no means of transferring labour with any degree of rapidity. It would be impossible, for example, to switch a gang of dockers from Tilbury in time to meet a shortage of labour brought about by an unexpected demand at Wapping. This may appear rather an extreme illustration, but the "turning round" of a ship, it must be remembered, is work which has to be done at high pressure and with the utmost expedition. It follows, therefore, that as the volume of work at Tilbury may vary quite independently of the amount at Wapping, a supply of labour sufficient to meet the maximum requirements of each area must always be available. In short, the load of a port like London is the aggregate of the loads of each separate labour area.

The Existence of Excessive Casualization.—The difficulty of providing a supply of labour to meet the practical requirements of the industry has tended to become somewhat obscured in the denunciation of the casual system of engagement. In solving the problem it must be admitted that the system gives rise to a great deal of chronic under-employment; that it was in the past

and still is in many respects a vicious and demoralizing system; and further that casualization tends to breed a class of inefficient and unemployables. But in spite of the social problem which it creates, the system has remained, not so much because of the passive attitude of employers or public opinion in general, as by reason of the impossibility of obtaining, without a substantial margin of casual workers, a supply of available labour which will rise or fall as occasion demands. The practical problem of decasualization lies in reducing this margin to the lowest possible proportions. In the past it is clear that owing to the methods and conditions of recruitment of the casual labourer, the margin was unnecessarily large; with every reduction in the margin there will be a corresponding diminution in the evils incidental to excessive casualization.

The extent to which indiscriminate selection and separate pools of labour spread work among an unnecessarily large number of men have been made familiar by the writings of Mayhew, Booth and others. But while the main features of the system of "calling on" still remain, something has been done to check the excessive competition for employment, which in pre-War days, caused much chronic distress among dock labourers. This over-competition arose through the influx into the docks of workers unable to find other employment, this being most seriously felt in years of trade depression, as for example, 1905-06. In theory, the remedy is obvious, but the practical application of the principle of restricting the right to look for work has proved no easy matter. It was not until 1912 that the first important experiment in this direction was made in Great Britain in the Liverpool Docks scheme.

The Liverpool Docks Scheme.—At the time the scheme was initiated, practically all the work at the Port of Liverpool was done by casual labour, of which there was an abnormally large surplus. It was estimated that the total number of men required on the busiest day was not more than 20,000, while the number normally seeking employment was over 29,000, and yet, it appears, "at a time when the surplus of labour exceeded 7,000, lodging houses in Liverpool were attracting labour from Ireland by advertisement that work was plentiful at the docks."

Dock Labour and Decasualization.—The attempt to remedy this state of affairs was made by "registering" dockers, from which the name "Registration Scheme" is derived, and limiting the right to look for employment to men in possession of "tallies," which are brass tokens bearing the registered number of each docker. Special provision was made for facilitating the distribution of labour, while other reforms included the weekly centralized payment of wages, the object of the last mentioned being to save dockers from the hardship of tramping from employer to employer to collect their week's pay. The control of the issue of tallies as well as the general supervision of the scheme was under a joint committee of employers and workpeople.

A valuable commentary on the practical difficulties of decasualization is afforded by the 15 years working of the scheme. Although backed by their union, the scheme was launched only in the face of the fiercest opposition of sections of the dockers; when this was overcome, the casual workers objected to being shifted outside their own labour area. The special arrangements intended to improve the mobility of labour have thus been ineffective, and as a result the reduction of the casual margin has proved even more difficult than was anticipated. It is true that the position of the casual labourer at Liverpool is still unsatisfactory, though it is better than in 1912, but it is equally true that in warding off the threatened influx of unemployed from other trades the scheme has made the problem much less acute than it would have been.

Registration Schemes and the Post-War Problem.—During the World War period casualization as a problem practically ceased to exist in Great Britain. In most of the largest ports, registration schemes operated by "Port Labour Committees" were set up to deal with War-time labour questions, including the issue of exemption certificates and the release of dockers for military service; and at the Armistice, schemes on somewhat similar lines were resuscitated to assist in meeting the dual problem caused by congestion at the docks and the threatened rush of entrants from

other trades. Except in one or two instances (e.g., Bristol), these schemes, for various reasons, either became ineffective or fell into abeyance. This was unfortunate, as the establishment of a registration scheme is the first essential step towards decasualization. As a result, however, of the movement which originated in the appointment of the Roche Committee of Enquiry in 1919, and subsequently led to the formation of a standing committee under Sir Donald Maclean in 1924, registration schemes have been established in practically every large port.

A general idea of the problem can be obtained from a survey of the conditions of the Port of London, not only because casualization there is more extensive, and probably more intensive as well, than in any other large area, but also because conditions in London serve best to illustrate the extent to which the varying volume of work at the docks creates casualization in other trades, and in this way brings into existence a vast pool of casual labour.

Port of London Registration Scheme.—It was not until 1920 that a registration scheme was established to deal with the port of London as a whole. As far back as 1905 a successful attempt at decasualization was made by one of the largest employers in the port, the London and India Dock company, and this reform was carried a little farther when this company and others were absorbed in the Port of London Authority in 1908. But the decasualization of one body of dock workers into various grades of "permanent" and "preference" men, while affording incontrovertible evidence of the beneficial effects of the reform to the men involved, and also of the economies which could be effected by a systematic distribution of labour, only tended to make the burden more acute for the remaining casual margin. The intensity of the problem in London is, in fact, due in considerable measure to the existence of so many specialized workers, such as deal porters and coal porters, and the non-interchangeability of the work of these men with that of the ordinary casual labourer. That the problem was accentuated by the influx of workers from other trades, particularly since the commencement of the post-War depression, there was little doubt, and the delay in evolving a suitable registration scheme arose not from apathy on the part of the authorities concerned, or from opposition on the part of the dockers (such as, for example, has proved so great a stumbling-block in Glasgow) but mainly from the difficulty of dealing as a whole with the many diverse elements in the port. Following the recommendations of the Roche Committee of Enquiry these difficulties were overcome.

The scheme was framed on the lines of the Liverpool model, the control of the issue of tallies, as is essential for the smooth working of a registration scheme, being under a joint committee of employers and workpeople. Such was the extent of the casual problem in London that, although applications were carefully scrutinized, the committee found it necessary to issue about 61,000 tallies. This number obviously exceeded the port requirements, but owing to difficulties which arose in the working of the scheme, the register was reduced by only about 7-8,000 in the first five years. On the reconstitution of the committee in 1925, it was found possible, with closer co-operation from employers and trade unions, to effect further reductions. At the end of 1927 the number of tallies in circulation was about 40,000, and although the retention of a registry of this size still involves the existence of a substantial fringe of under-employed workers, it is considered, in view of adverse London factors, that it hardly exceeds normal requirements.

The Transport Trades.—Casual labour has so far been treated as it emerges from the varying amount of loading and unloading at the docks. It would be misleading, however, to suggest that this is more than one aspect. Since the varying volume of dock work necessarily causes a varying load in transportation and distribution, the different transport trades must each have their separate casual margins. The extent of casualization thus engendered is difficult to estimate. Its existence is most apparent in a large distributive area like London; and there is little doubt that the post-War depression in Great Britain with the general shortening of contracts incidental thereto has increased the dimension of the problem. While a more systematic distribution of the load

might possibly lessen the intensity of its fluctuations, it is difficult to see that there is any way to a general diminution of casualization in these trades other than that which would follow from a trade revival.

Ship-repairing Industry.—The special problem of casualization in the ship-repairing industry arises from the short, intermittent spells of work which the industry affords. The decision to send a ship to the yard for repair or overhaul depends on an almost infinite variety of factors, ranging from the age of the ship and the general state of trade, to the manifold uncertainties associated with the operation of steamship traffic. Ship-repairing jobs, moreover, unlike shipbuilding contracts, are essentially short in their nature. The quick "turn round" of a vessel is a factor even more essential in ship-repairing yards than at the docks. The conditions of the industry are, therefore, such as to involve for its personnel long periods of unemployment between short spells of intensive employment. The "scaler" or "rigger" may be working overtime for two or three days on end and obtain no further work for days or weeks, or even months thereafter.

Decasualization in ship-repairing is even more difficult than in dock labour. It is accentuated by the fact that in most of the big ship-repairing centres the yards are often spread over a wide area or separated by distances too long to make labour effectively mobile. But an unnecessarily large margin of casual labour is retained owing to the wasteful methods by which this labour is recruited and distributed. In this industry, to an even greater extent than at the docks, the old system of small, detached "calling on" stands remains general.

Future of Decasualization.—The existence of an under-employed fringe of casual workers at the docks, and in other industries, gives rise to one of the most pressing industrial problems of the day. It is a problem whose solution cannot be found in the force of economic tendencies; moving in the direction of driving from these industries those who are unable to obtain a livelihood there. The possibility of short spells of employment at the relatively high rate of wages, which is a general feature of industries utilizing a high proportion of casual labour—the ship-repairing industry in particular—is sufficiently attractive to compensate for long periods of under-employment. It is, therefore, abundantly clear, in view of the manifest evils incidental to chronic under-employment, that decasualization, from every point of view, is a step which is eminently desirable.

Ethical and moral considerations, however, should not be permitted to obscure the fact that, not only from the economic needs of the industries concerned, but also because of the problem involved in making provision for the unemployed margin displaced in decasualization, the step must necessarily be a gradual one. As Sir William Beveridge pointed out in 1908 (*Unemployment—A Problem of Industry*), it is a step which should be made in times of good trade rather than of bad trade, and it is one in which an important part can be played by an efficient system of Employment Exchanges.

BIBLIOGRAPHY.—A very wide literature exists on the casual labour question. The most modern and at the same time the most informative book on the subject is by Lascelles and Bullock, *Dock Labour and Decasualization* (1924), where a comprehensive bibliography is given in appendix C. (G. C. P.)

United States.—The casual employment problem possesses the same characteristics in the United States as in England, though the dock problem is, relatively, less significant. Plans for the decasualization of dock labour have been worked out, notably at Seattle, where the plan is not based on collective bargaining with the longshoremen's union, but on joint organization involving employee representation. Both union and non-union men are members of this representation plan, the majority being union men. Here a joint employment committee of four employees and four employers become responsible for controlling the numbers and selection of men eligible to work on the water front. Pay-roll statistics are collected which furnish an accurate record of the employment and earnings of each man. Each company appoints a single foreman to do all of its hiring and agrees that all new men be employed from a central dispatching hall. Through a process of central registration the lists were closed to new men

and the elimination of surplus longshoremen began. "Floaters" and incompetents are denied employment. In Sept. 1920 there were 1,420 longshoremen registered on the Seattle docks; in Aug. 1921 there were but 612.

The workmen are divided into three classifications, "company gangs," "hall gangs" and "the extra board." The company gangs are selected by each company to work exclusively for them. The company agrees to furnish them steady employment and endeavours to establish lines of promotion for them. The hall gangs are reserved gangs for the docks as a whole which are held in reserve at the central dispatching hall for call to the dock of any particular company. These hall gangs are adequate to meet all but very exceptional peaks of labour demand, when casuals may be called into service. The extra board consists of men officially registered in the dispatching hall who are not members of gangs but are used for the replacement of absentees in the gangs and for other demands calling for individuals.

Information by wireless concerning ships due to arrive facilitates the planning of work and distribution of the labour force in advance of the docking of the ships. An increasing use of improved machinery for handling cargoes on the docks has combined with the regularization of longshore work to reduce the number of dock workers to a fraction of what it formerly was. A statement issued concerning the present personnel on the Seattle docks states that two-thirds of the men are married and that the full time water-front worker is now enabled to earn an adequate livelihood for a family.

But both the United States and Canada have casual labour problems which are distinctly different from those on the docks. The term "casual" is being used here in the somewhat larger sense of irregular employment offering work lasting from a few days to a few weeks. There are, of course, many kinds of strictly casual work such as cleaning and gardening work at private homes or industrial work such as unloading a car of coal or doing odd jobs at stores and factories. A city of 200,000 will ordinarily have from two to four or five hundred such casuals registered at the employment agencies. A much more significant situation, however, is the irregular work in lumbering, railroad "extra gang" work, grain and fruit harvesting, in-shore fishing and in construction and canning industries. Many lumber camps in the United States recruit much of their labour from farms and other industries within the same State, giving winter employment to men who would otherwise be idle.

In these cases two seasonal industries are dovetailing and decasualization is being effected. In a larger percentage of cases the lumber camps are filled by men sent out by employment offices in large cities. The Canadian employment service, especially in Ontario, has sent its representatives into lumber camps to move lumbermen directly from the camps to farms in the spring, and then helped these men in the fall to get back into the camps for the winter. State employment offices, such as those at Duluth, Minn., and Superior, Wis., regularly transfer dock and construction workers and many farm hands to the woods each winter.

Railroad extra gang work comes in the spring and summer. It consists of spring repairing of road beds, replacing ties, building bridges and extensions and re-locating road beds. A single railroad may call for from 10,000 to 30,000 men, all of whom it wants available in March, April or May. Immigrants and migratory seasonal labourers (hoboes) are sent to this work by employment agencies. Much of this labour is used on jobs lasting but a short time; more of it has become so accustomed to irregular employment that it will not remain more than from one to three weeks. Railways are spreading this work over a longer portion of the year than formerly. The quota laws which restrict immigration, the higher wages now received by common labour, and a better realization of the excessive costs incident to constant changes in the personnel of a labour force, have caused the railroads to endeavour to stabilize extra gang work in order to build up more efficient crews.

Agricultural harvests have produced large scale demands for semi-casual labour. In Saskatchewan and Alberta the grain har-

vests require the importation into the two provinces of some 25,000 men each year for a few weeks work. These men have to be moved, on the average, about 1,500 m. The grain harvests of the great plains region of the United States, stretching northward from Mexico to the plains of western Canada, employ thousands of harvesters. On the Atlantic seaboard truck and fruit farming produces harvest labour demands from Florida north to Connecticut, and here large numbers of workers migrate northward with the advancing summer season. The Pacific coast exhibits a similar phenomenon and on a large scale; fruits and vegetables ripen in the Imperial valley, near the Mexican border, in the late winter, and the ripening process moves northward as the season advances. Many thousands of labourers, both individuals and families, Mexicans and Americans, move northward with the harvest.

Each winter the larger cities find themselves with tens of thousands of these migrant workers on their hands, unable to find winter employment and often destitute. Even during the harvest season itself they suffer much unemployment. When a crop begins to ripen in any locality, the demand for labour is intense until the crews are filled. Before the harvest reaches maximum activity this is accomplished and the demand for labour declines sharply. Additional men are needed only for replacement of individuals who quit or are discharged during the harvest. Meanwhile many workmen who had heard of the demand for labour in the locality keep coming in. When the harvest is at its peak the locality is often flooded with labour, which in turn is again drained away by news of a demand elsewhere. Many competent harvesters have from 15 to 25 jobs during a harvest season of three months, none lasting more than two or three days, since they frequently arrive in each locality after the crews are filled.

The farm labour division of the U.S. employment service has done a great deal during the last decade to mitigate this situation in the grain and cotton harvests, by publishing daily accurate information upon the supply and demand for labour in the various parts of this harvest area. The combine-harvester machine, which is being rapidly introduced on the American and Canadian prairies, uses much less labour than the older type of machinery. This is reducing the demand for migratory labour for the grain harvest. The situation in the fruit harvests has not been effectively attacked. As the country develops and mechanization of industry and agriculture proceeds, the demands for labour which have produced the migratory semi-casuals so characteristic of the United States are gradually dying out, and this class of labour is vanishing.

Lescobier, "A Clearing House for Labor," *Atlantic Monthly* (June, 1918), and *The Labor Market* (1919); "Sources of Supply and Conditions of Employment of Harvest Labor in the Wheat Belt," *Bulletin 1211*, U.S. Department of Agriculture (May 23, 1924). (D. D. L.)

CASUALTIES, in military use, the losses of a force in war by death, wounds, sickness, desertion or any other cause (from Lat. *casus*, that which falls out). The duty of dealing with all casualties from wounds or sickness falls to the medical services, the personnel of which treats each case from the moment of its occurrence to the eventual recovery or death of the patient.

CASUAL WARD. The casual ward is a part of the British method of dealing with vagrancy. Under the Poor Law as reformed in 1834 the primary duty of boards of guardians was to relieve destitute persons within their districts. Gradually, however, it was extended to the administering of relief to vagrants also, or casual paupers, as they were officially termed. The treatment in English casual wards depends very much upon the board of guardians and the master of the workhouse. The ministry of health lays down certain regulations but within those limits there is the possibility of either great harshness or unlooked-for kindness.

Any vagrant or unemployed man walking from place to place and seeking work usually obtains an order for the casual ward from the relieving officer or his assistant. He can, however, be admitted to the workhouse without an order and it is very fre-

quently the case that vagrants and tramps calling after 4 P.M. in winter or 6 P.M. in summer are admitted without further question. When admitted they are supposed to be searched but usually the search is of a somewhat perfunctory nature. They are deprived of money and tobacco, but all articles are restored to them on discharge. As soon as practicable after admission vagrants are required to take a bath which is sometimes, but not always, warm. The meal is usually a cup of cocoa without sugar and a piece of bread. On retiring for the night the clothes of the inmates are taken away and a rough night-shirt provided. The clothes are sometimes disinfected. Sleeping accommodation is provided either in cells or associated wards; two or three blankets are supplied and the vagrant either sleeps upon the floor or on a truckle bed with pillows. In return for the food and lodging, a task of work is required. This may consist of stone breaking, wood sawing, or wood chopping, digging or oakum picking, or scrubbing floors. In many of the casual wards, however, the task to be accomplished is not too rigidly enforced.

Vagrancy Committee, 1904.—In 1904 the president of the local government board appointed a departmental committee to enquire into the subject of vagrancy and one of the questions then considered was that of the casual ward and methods of improvement. A recommendation of the committee was the transference of casual wards to the control of the police authorities and the issue of way-tickets such as are used on the continent of Europe and in some English counties. The police have handed to them the way-tickets which they present to bona fide unemployed who are seeking for work. Another recommendation of the committee was that habitual vagrants should be detained in labour colonies which was also the recommendation of the royal commission on the Poor Laws 1910. The vagrancy committee, as it was called, recommended that the English way-tickets in book form should give a personal description of the vagrant, his usual trade, his reason for wanting to travel and his proposed destination. In addition it should contain his signature and possibly his finger prints for the purpose of testing identity. The name of each casual ward was to be stamped on the ticket and the duration of the ticket was to be limited to a certain period, possibly a month. In possession of such a ticket a man would be entitled at the casual ward to a night's lodging, supper and breakfast and then after performing two hours' work to help to pay for his food and lodging he should be free to leave whenever he liked. The name of the next ward on his route which he could reach that night should be entered on the ticket and on his arrival at that place the same procedure would be resorted to. So far the recommendations have not been carried out.

After 1918, as a result of post-war conditions and industrial disputes, there has been a great increase in the number of those applying for assistance to the poor law guardians. As it has been quite impossible for the ordinary casual ward to deal with the large number of single men who have been unemployed, the guardians have granted out-door relief on a much larger scale and this is one of the many problems that will have to be considered when the future of the Poor Law as a whole comes up for consideration. (See VAGRANCY.)

CASUARIIDAE: see CASSOWARY.

CASUARINA, a genus of odd trees containing about 35 species, chiefly Australian, but a few Indo-Malayan. The long whip-like green branches are longitudinally grooved, and bear at the nodes whorls of small scale-leaves, the shoots resembling those of *Equisetum* (horse-tail). The flowers are unisexual. The staminate are borne in spikes, each flower consisting of a central stamen which is surrounded by two scale-like perianth-leaves. The pistillate are borne in dense spherical heads; each flower stands in the axil of a bract and consists of two united carpels flanked by a pair of bracteoles; the long styles hang out beyond the bracts, and the one-chambered ovary contains two ovules. In the fruit the bracteoles form two woody valves between which is a nut; the aggregate of fruits resemble small cones. Pollen is transferred by the wind to the long styles. The pollen-tube does not penetrate the ovule through the micropyle but enters at the opposite end—the chalaza (see ANGIOSPERMS).

The wood is very hard, and several species are valuable timber trees. From a fancied resemblance of the wood to that of the oak these trees are known as "oaks," and the same species has different names in different parts such as "she-oak," "swamp-oak," "iron-wood" and "beef-wood." Several species are cultivated in the subtropical parts of the United States, especially the beef-wood (*C. equisetifolia*), which has become naturalized in Florida.

See J. H. Maiden, *Useful Native Plants of Australia* (London and Sydney, 1889).

CASUISTRY, the art of bringing general moral principles to bear on particular actions. It is, in short, applied morality; anybody is a casuist who reflects about his duties and tries to bring them into line with some intelligible moral standard. But morality at different times has worn very different dresses. It has sometimes been thought of as an outward law, sometimes as an inward disposition; and each of these rival conceptions has developed a casuistical method of its own. Believers in law have put their trust in authority or logic; while believers in disposition chiefly look to our instinctive faculties—conscience, common-sense or sentiment. The legal is the older group, and to it the name of casuist is often exclusively reserved, generally with the implication that its methods are too purely technical to commend themselves to mankind at large. But common-sense and conscience are quite as definite guides as logic or authority; and there seems no good reason for refusing to give the name of casuistry to their operations.

The casuistry of primitive man is uncompromisingly legal. His morality is not yet separated from his religion; and religion for him means the cult of some superior being—the king or priest of his tribe—whose person is charged with a kind of sacred electricity. "His divinity is a fire, which, under proper restraints, confers endless blessings; but if rashly touched, or allowed to break bounds, it burns or destroys what it touches. Hence the disastrous effects supposed to follow a breach of taboo; the offender has thrust his hand into the divine fire, which shrivels up and consumes him on the spot" (Frazer, *The Golden Bough*, i. 169). Elaborate rules are accordingly drawn up to secure the maximum of benefit, and the minimum of inconvenience, from this sacred fire; and in the application of these rules does savage casuistry consist. At a higher stage of civilization the god is no longer present in person but issues to his worshippers categorical commands. These logic must seize upon and develop as far as they will go; for the breach of some trifling consequence of a rule might mean the loss of the deity's favour. Hence the rise of sacred books among most Eastern peoples. On the Jewish Decalogue, for instance, follows the law, and on the law the rabbinical schools. Some of these will be stricter, and some laxer; but on the whole all tend to "aggravate" the law—down to the point of forbidding the faithful to wear a girdle, or to kill a noxious insect on the Sabbath. Though indeed we might look nearer home than the Talmud for similar absurdities; most Puritan communities could furnish strange freaks of Sabbatarian casuistry. Nor have the Catholics been one whit behind them. Their scholastic doctors gravely discuss whether—since water is the "matter" of baptism—a soul can be made regenerate by milk, or rose-water or wine.

At the opposite pole stood ancient Greece. Here ceremonial casuistry found no place, because there were no sacred books. "Among the Greeks writing never attained the consecration of religion. No system of doctrine and observance, no manuals containing authoritative rules of morality, were ever transmitted in documentary form. In conduct they shrank from formulae. Unvarying rules petrified action; the need of flexibility, of perpetual adjustment, was strongly felt" (Butcher, *The Greek Genius*, p. 182). For this reason their interest in ethical speculations was all the keener; their great thinkers were endlessly engaged in settling what the relation ought to be between duty and self-interest. Ought one to swallow up the other—and, if so, which should prevail? Or was it possible to patch up a compromise between them? The great Stoic philosophers took the austere line, and held that duty should always and everywhere be our only law. But it was one thing to enunciate such magnificent theories in a lecture, and quite another to apply them in

the market-place. Casuistry came to the aid of average human nature—that is to say, pupils began to confront the master with hard cases taken from daily life. And more than one master was disposed to make large—even startlingly large—concessions to the exigencies of practice. This concrete side of moral philosophy came specially into evidence when Stoicism was transplanted to Rome. Cicero's *De Officiis* abounds in the kind of question afterwards so warmly discussed by Dr. Johnson and his friends. Is it ever right to tell a lie? May a lawyer defend a client whom he knows to be guilty? In selling my goods, is it enough not to disguise their shortcomings, or ought I candidly to admit them? Seneca even made the discussion of such problems into a regular discipline, claiming that their concrete character gave an interest in morality to those who had no love for abstractions; while they prevented those who had from losing themselves in the clouds. And M. Thamin maintains, that, if his heroes did not form great characters, at any rate they taught the Roman child to train its conscience. But, then, Cicero and Seneca took common-sense as their guide. They decided each problem on its merits, looking more to the spirit than to the letter, and often showing a practical sagacity worthy of Johnson himself. Quite in the great doctor's spirit is Cicero's counsel to his son, to hear what the philosophers had to say, but to decide for himself as a man of the world. Such advice could not be grateful to the philosophers themselves—then a definite professional class, not unlike the "spiritual directors" of a later Rome, who earned their bread by smoothing away the doubts of the scrupulous on all matters intellectual and moral. Their great weapon was their logic; and a logician, as Pascal says, must be very unfortunate or very stupid if he cannot manage to find exceptions to every conceivable rule. In their hands casuistry became the art of finding such exceptions. From the Greek sophists they borrowed ingenious ways of playing off one duty against another, or duty in general against self-interest—leaving the doubter the alternative of neglecting the one and being a knave, or neglecting the other and being a fool. Or else they raised a subtle distinction between the act and the intention. To get drunk for the sake of a drink was the mark of a beast; but wine was a powerful stimulant to the brain, and to fuddle oneself in order to think great thoughts was worthy of a sage. No doubt these airy paradoxes were not always seriously taken; but it is significant that a common Roman proverb identified "philosophizing" (*philosophatur*) with thinking out some dirty trick.

Christianity swept the whole discussion on to a higher plane. All the stress now fell on the disposition, not on the outward act. The good deeds of a just man were a natural consequence of his justice; whereas a bad man was no whit the better, because he now and then deviated into doing right. Actions, in short, were of no account whatever, apart from the character that produced them. "All things are lawful unto me," said St. Paul, "but all are not expedient." And St. Augustine sums the whole matter up in the famous phrase: "Have charity, and do as thou wilt." Narrow-minded Christian consciences, however, could not stay long on this level; law was so very much more satisfying a guide than vague, elusive charity. And law in plenty was forthcoming, so soon as the Church developed the discipline of public confessions followed by appropriate penances for each fault. At first the whole proceeding was informal and impulsive enough; but by the 7th century it had grown thoroughly stereotyped and formal. *Libri Poenitentiales* began to appear—detailed lists of all possible sins, with the forfeit to be exacted from each. As public penance finally decayed, and auricular confession took its place, these were superseded by the *Summae de Poenitentia*—law-books in the strictest sense. These were huge digests of all that popes, councils, Early Fathers had decided on every kind of question pertaining to the confessional—what exactly is a sin, what kind of questions the priest must ask, under what conditions he could give absolution. As such, they were eagerly welcomed by the clergy; for a single magistrate, sitting in secret without appeal, necessarily grasps at whatever will lighten his burden of responsibility. Nor was their complexity a stumbling-block. The mediaeval mind was only too prone to look on morality as a highly technical

art, quite as difficult as medicine or chancery law—a path where wayfaring men were certain to err, with no guide but their unsophisticated conscience. What could they possibly do but cling to their priest with a "blind and unexpressed faith"?

Against this state of things the Reformation was a violent protest. Catholicism increasingly took for granted that a man imperilled his soul by thinking for himself; Protestantism replied that he could certainly lose it, if he left his thinking to another. For it is to the individual conscience God speaks; through the struggles of the individual conscience He builds up a strong and stable Christian character. "A man may be a heretic in the truth," says Milton in his *Areopagitica* (1644), "if he believes things only because his pastor says so, or the Assembly so determines, without knowing other reason, though his belief be true, yet the very truth he holds becomes his heresy. There is not any burden that some would not gladlier post off to another than the charge and care of their religion. A wealthy man, addicted to his pleasures and his profits, finds religion to be a traffic so entangled, and of so many piddling accounts, that of all mysteries he cannot skill to keep a stock going upon that trade. What does he therefore but resolve to give over toiling, and find himself some factor, to whose care and conduct he may commit the whole managing of his religious affairs—some divine of note and estimation that must be. To him he adheres, resigns the whole warehouse of his religion with all the locks and keys into his custody, and indeed makes the very person of that man his religion. So that a man must say his religion is now no more within himself, but is become a dividual moveable, which goes or comes near him, according as that good man frequents the house."

Twelve years after the *Areopagitica* appeared Pascal's *Provincial Letters* (1656-1657). These deal with the casuists of the Counter-Reformation in the spirit of Milton, laying especial stress on the artificiality of their methods and the laxity of their results. Not, of course, that they meant deliberate evil; Pascal expressly credits them with good intentions. But they were drawn, almost to a man, from Italy or Spain, the two countries least alive to the spirit of the Reformation; and most of them were Jesuits, the order that set out to be nothing Protestantism was, and everything that Protestantism was not. Hence they were resolutely opposed to any idea of reform; for to begin making changes in the Church's system would be a tacit admission that Luther had some show of reason on his side. On the other hand, they would certainly lose their hold on the laity, unless some kind of change were made; for many of the Church's rules were obsolete, and others far too severe to impose on the France of Montaigne or even the Spain of Cervantes. Thus caught between two fires the casuists developed a highly ingenious method, not unlike that of the Roman Stoics, for eviscerating the substance of a rule while leaving its shadow carefully intact. The next step was to force the confessors to accept their lax interpretation of the law; and this was accomplished by their famous theory of *probabilism*—first taught in Spain about 1580. This made it a grave sin in the priest to refuse absolution, whenever there was some good reason for giving it even when there were other and better reasons for refusing it. This principle does not deserve all the abuse that has been lavished upon it. It secured uniformity in the confessional, and thereby protected the penitent from the caprices of individual priests; and by depriving these of responsibility, it forced the penitent back on himself. But the gain was more than counterbalanced by the evil. The less the Church could expect from its penitents, the more it was driven to trust to the miraculous efficiency of sacramental grace. Once get a sinner to confession, and the whole work was done. However bad his natural disposition, the magical words of absolution would make him a new man. As for most penitents, all they cared for was to scrape through by the skin of their teeth. Casuistry might insist that it only proposed to fix the minimum of a minimum, and beg them for their soul's sake to aim a little higher. Human nature seldom resists the charms of a fixed standard—least of all when it is applied by a live judge in a visible court. If the priest must be satisfied with little, why be at the trouble of offering more? For this reason, probabilism found vigorous opponents in

Bossuet and other eminent divines; and various of its excesses were condemned by the popes during the latter half of the 17th century. After a long eclipse it was finally re-established, though in a very modified form, by Alfonso Liguori about the middle of the 18th century.

In Protestant countries casuistry shrank and dwindled, though works on the subject continued to be written both in Germany and England during the 17th century. The best known of the Anglican books is Jeremy Taylor's *Ductor Dubitantium* (1660). But the Protestant casuist never pretended to speak authoritatively; all he did was to give his reasons, and leave the decision to the conscience of his readers. "In all this discourse," says Bishop Sanderson, one of the best of the English writers, "I take it upon me not to write edicts, but to give my advice." Very soon, however, these relics of casuistry were swept away by the rising tide of common-sense. The 18th century loved to discuss hard cases of conscience, as a very cursory glance at Fielding's novels (1742-1751) or Boswell's *Life of Johnson* (1791) will show. But the age was incurably suspicious of attempts to deal with such difficulties on any kind of technical system. Pope was never tired of girding at

Morality by her false guardians drawn,
Chicane in furs, and casuistry in lawn.

while Fielding has embodied the popular conception of a casuist in Parson Thwackum and Philosopher Square, both of whom only take to argument when they want to reason themselves out of some obvious duty. Still more outspoken is the Savoyard vicar in the *Émile* (1762) of Jean Jacques Rousseau: "Whence do I get my rules of action? I find them in my heart. All I feel to be good is good; all I feel to be evil is evil. Conscience is the best of casuists; it is only when men wish to cheat it that they fly to logical quibbles." Extravagant as this sentiment sounds, it paved the way to better things. The great object of 17th-century moralists had been to find some general principle from which the whole of ethics could be deduced; common-sense, by turning its back on abstract principles of every kind, forced the philosophers to come down to the solid earth, and start by enquiring how the world does make up its mind in fact. During the last two centuries deduction has gone steadily out, and psychology come in. Ethics has become more distinctively a science, instead of an awkward hybrid between a science and an art; its business has been to investigate what moral conduct is, not to lay down the law as to what it ought to be. Hence they deliberately refuse to engage in casuistry of the old-fashioned sort. Further, it is increasingly felt that ethical judgments do not depend on reason alone, but involve every element in our character; and that the real problem of practical morality is to establish a harmonious balance between the intelligence and the feelings—to make a man's "I think this is right" correspond with his "I feel that it is so." Whether systematic training can do anything to make the attainment of this balance easier is a question that has lately engaged the attention of many educational reformers; and whatever future casuistry may still have before it would seem to lie along the lines indicated by them.

There is an excellent study of the ancient casuists by M. Raymond Thamin, *Un Problème moral dans l'antiquité* (1884). For the Roman Catholic casuists see Döllinger and Reusch, *Moralstreitigkeiten im siebzehnten Jahrhundert* (Nordlingen, 1889), and various articles ("Casuistik," "Ethik," "Moralsysteme," etc.) in Wetzer and Welte's *Kirchenlexicon* (Freiburg, 1880-96). See also the editions of Pascal's *Provincial Letters*, by John de Soyres (with English notes, Cambridge, 1880), and A. Molinier (Paris, 1891). The Anglican casuists are discussed in Whewell, *Lectures on Moral Philosophy* (1862). For general reflections on the subject see the appendix to Jowett's edition of the *Epistle to the Romans* (1855). Most modern text-books on ethics devote some attention to the matter—notably F. H. Bradley in his *Ethical Studies* (1927). See also Hastings Rashdall, *Theory of Good and Evil* (Oxford, 1907). (St. C.)

CASUS BELLI, an act or omission which, if not rectified, may justly be remedied by war. Interference with the full exercise of a nation's rights or independence, an affront to its dignity, an unredressed injury, are instances of *casus belli*. (See ARBITRATION.)

CAT, the name of the well-known domesticated animal *Felis domestica*, but in a wider sense employed to denote all the more typical members of the family *Felidae*. The word "cat" is also applied to other objects, in all cases an application of the name of the animal. In mediæval siegecraft the "cat" was a movable pent-house used to protect besiegers when approaching a wall or gateway. "Cat" or "cat-head," in nautical usage, is the projecting beam on the bows of a ship used to clear the anchor from the sides of the vessel when weighed. The name is also used of a type of a vessel, formerly used in the coal and timber trade in north-east England; it is still applied to a small rig of sailing-boats. The instrument of punishment, generally called the "cat o' nine tails," consists of a handle of wood or rope, about 18 in. long, with nine knotted cords or thongs.

Origin of Domestic Breeds.—It is well-known that the ancient Egyptians domesticated the Egyptian race of the African wild cat (*Felis ocreata maniculata*). These Egyptian cats are generally believed to have had a large share in the parentage of the European breeds, which have, however, been crossed to a greater or less extent with the European wild cat (*F. catus*).

One of the features by which the Egyptian differs from the European wild cat is the longer and less bushy tail; and it has been very generally considered that the same feature is characteristic of European domesticated cats. Measurement has shown, however, that this feature is not a reliable guide. Possibly those domesticated cats with unusually short and bushy tails may have a larger share of European wild-cat blood, and vice versa.

More importance was attached by A. Nehring of Berlin to the colour of the soles of the hind-feet for determining the relationship of the domesticated cat of Europe. According to him, in the Egyptian wild cat the pads of the toes are wholly black, and the black extends back either continuously or in long stripes as far as the heel-bone. In the European wild cat, on the other hand, the black is limited to a small round spot on the pads. In all domesticated cats retaining wild colouring the soles of the hind-feet correspond in this particular with the Egyptian wild cat. Nehring came to the conclusion that the domestic cat has a dual parentage, from a Chinese cat on the one hand, and from the Egyptian cat on the other. The ordinary domesticated cats of Europe are, however, mainly of African origin, although largely crossed with the wild cat. This opinion receives support from observations made by E. Blyth, endorsed and amplified by R. I. Pocock, according to which, two distinct types of so-called tabby cats are recognizable. In the one the pattern consists of narrow vertical stripes, and in the other of longitudinal or obliquely longitudinal stripes, which, on the sides of the body, tend to assume a spiral or sub-circular arrangement. One or other of these types is to be found in cats of almost all breeds, and there appear to be no intermediate stages. Cats of the striped type are no doubt descended from the European and north African wild cats; but the origin of the blotched pattern appears to be unknown. It may be suggested that they represent Nehring's presumed Chinese element in the cat's parentage, and that the wild stock may be a phase of the leopard-cat (*F. bengalensis*).

Tame cats from Egypt were probably imported at an early date into Etruria by Phœnician traders; and there is decisive evidence that they were established in Italy long before the Christian era. The progeny of these cats, more or less crossed with the indigenous species, spread over Europe, to become mingled at some period, according to Nehring's hypothesis, with an Asiatic stock. The earliest written record of the introduction of domesticated cats into Great Britain dates from about A.D. 936, when Hywel Dda, prince of South Wales, enacted a law for their protection. The remains of cats from Roman villas at Silchester and Dursley are probably referable to the domesticated breed.

European Wild Cat.—The wild European species, *F. catus*, in colour conforms closely to the striped phase of domestic tabby. Its geographical range formerly included Great Britain, central and southern Europe, and portions of central and northern Asia. It is now, however, much reduced in numbers and it is doubtful if it is found anywhere without at least a trace of the domestic form in its constitution. In Great Britain wild cats survive only in some

Scottish Forests. Remains of the wild cat occur in English caverns; in Ireland the wild species has apparently been unknown during the historic period.

The favourite haunts of the wild cat are mountain forests where rocks or cliffs are interspersed with trees, the crevices in the rocks or the hollow trunks of trees affording sites for the lair, where the young are produced and reared. Wild cats are described as some of the most ferocious and untamable of all animals. How far this lends support to the view of the origin of our domestic breeds is uncertain. Hares, rabbits, field-mice, water-rats, rats, squirrels, moles, game-birds, pigeons, and small birds, form the chief food of the wild cat.

Breeds of Domestic Cats.—Apart from the division of the striped members of both groups into two types according to the pattern of their markings, the domesticated cats of western Europe are divided into short-haired and long-haired groups. Of these, the former is the closer to the wild cats of Africa and of Europe, the latter being an eastern importation. The striped short-haired tabby is probably most nearly allied to the wild ancestors, the stripes being, however, to a great extent due to the European wild cat. In one direction the tabby shows a tendency to melanism, culminating in complete blackness, while in another there is an equally marked tendency to albinism. A third colour-phase, the "erythristic" or red, is represented by the sandy cat, the female of which takes the form of the "tortoiseshell," the colour being a blend of black, white and sandy.

There appear originally to have been two allied strains of long-haired cats, the Angora and the Persian, of which the former has been altogether replaced in western Europe by the latter. That these long-haired cats have an ancestry to some extent distinct from the ordinary short-haired breeds, is practically certain, and they are possibly derived from the manul (*Felis manul*), of the deserts of central Asia. Modern Persians exhibit nearly all the colour and pattern types of the short-haired breeds.

The tailless or Manx cat, in which the tail should be represented merely by a tuft of hair without any bone, is met with in many parts of Russia, and probably originally came from some far eastern country. Throughout Japan, China, Siam and the Malay countries, normal long-tailed cats are seldom seen. Instead are cats with more or less abbreviated tails, showing in greater or less degree a decided kink or bend near the tip. These cats are smaller than the ordinary short-tailed breeds, with rather longer hair, whose texture approaches that of rabbit-fur. The cry is said to be like that of the jungle-cat (*F. chaus*) of India and Africa. Kink-tailed cats are also known from Madagascar.

Among the domestic cats of India, spotted colouring, with a tendency for the spots to coalesce into stripes, is noticeable; and probably these cats are derived from the spotted Indian desert-cat (*F. ornata*), with crossing from other species. From the jungle-cat may be derived the Abyssinian breed, in which the ears are relatively large and occasionally tipped with long hairs (thus recalling the tufted ears of the jungle-cat). The colour is typically reddish-brown, each hair being "ticked" like that of a wild rabbit.

By far the most remarkable of Old World domesticated breeds is, however, the royal Siamese cat, which almost certainly has an origin distinct from that of the ordinary European breeds. Siamese cats may have the tail either straight or kinked, but the latter feature may have been acquired by crossing with the ordinary kink-tailed cats of the country. In the Siamese breed the head is rather long and pointed, the body also elongated with relatively slender limbs, the coat glossy and close, the eyes blue, and the general colour some shade of cream or pink, with the face, ears, feet, under-parts and tail chocolate or seal-brown. There is however a wholly chocolate-coloured strain in which the eyes are yellow. The young are white. These cats are extremely delicate. The blue eyes and the white coat of the kitten indicate that the Siamese is a semi-albino.

It seems probable that southern North America and South America possessed native domesticated breeds of cats previous to the European conquest; and if so, these breeds must be derived from indigenous wild species. One of these is the Paraguay cat,

which when adult weighs only about three pounds, and is not more than a quarter the size of an ordinary cat. The body is elongated, and the hair, especially on the tail, short, shiny and close. It may be derived from the jaguarondi (*F. jaguarondi*). Mexico had a breed of hairless cats, said to have been kept by the Aztecs, but now well-nigh if not completely extinct. Although entirely naked in summer, these cats developed in winter a slight growth of hair on the back and ridge of the tail. Numerous clubs have been founded in Europe and North America to encourage the breeding of cats and to promote cat shows. The short-haired cats are easily managed, but the long-haired varieties need more care owing to the tendency of the hair to shed.

CATABOLISM, the name applied in biology to the process of breaking down organic tissues, in contradistinction to anabolism (*q.v.*), the process of building them up. Catabolism and anabolism are collectively called metabolism (*q.v.*). (See LIFE.)

CATAclysm, a great flood (Gr. κατακλυσμός, a deluge). In geology an overwhelming catastrophe producing sudden changes in the earth's surface; figuratively, any violent change that sweeps away the existing social or political order.

CATAcombs. Tombs hewn in solid rock were used by the Etruscans as independent family burial places, grouped together. They often rise in the hillside by tiers or are on the same level branching off into streets and alleys. Their plan is for the most part that of a house and the walls are often covered with paintings in an archaic style in red and black. At Poggio Gaiella, near Chiusi, the ancient Clusium, is a cemetery with a sepulchral chamber containing a large hall about 25 ft. in diameter supported by a cylindrical rock pillar. Opening out of this and other chambers are low winding passages, just large enough for a man to creep through, and this tomb has been surmised to be that of Lars Porsena, king in his day of Etruria (see fig. 2).

In the days of the Republic inhumation was general and the bodies of the Scipios and the Nasos were buried in still existing catacombs, the term applied by transference to subterranean excavations for the interment of the dead. Originally it designated the natural configuration—in hollows—of a district close to the Appian way (see ROME). In the vaults below the church of St. Sebastiano lay, according to tradition, the bodies of the Apostles St. Peter and St. Paul for seven months until removed to the basilicas which bear their names. The place became an object of pilgrimage and its name κατακυμβας, "by the hollow," developed as a generic name for all burial places of the same kind.

Rome is built upon a rock and the three strata named by geologists *tufa litoides*, *tufa granolare* and *pozzolana* have all been exploited. The *tufa litoides* is quarried as building stone. The catacombs of Rome—the most extensive known—are constructed in this stratum alone as it enabled the engineers to form vertical

FROM DENNIS
FIG. 1.—PLAN OF ETRUSCAN TOMB AT CERVETRI

walls for the galleries in which the dead were placed and to work with comparative ease. The pozzolana used as an ingredient for mortar was worked from the lowest stratum so that in spite of old erroneous persistent beliefs the burial places are distinct from the pozzolana, excavated in different strata, though here and there starting from the same level. The catacombs form a vast labyrinth of narrow galleries usually from 3 to 4 ft. wide with small chambers at intervals, excavated at successive levels (fig. 1). The dead are buried in the galleries in long horizontal recesses in the walls, tier upon tier, even to 12 ranges. The galleries generally run in straight tiers, at the same level, in storeys (seven in one part of the cemetery of S. Calixtus), and intersect at various angles (see fig. 3). The graves (*loculi*) were usually parallel to

MEMBERS OF THE CAT FAMILY FOUND IN AFRICA, ASIA AND AMERICA

1. Lion (*Felis leo*), one of the two largest of the cat family, the other being a tiger. It is found in Africa, Mesopotamia, Persia and India
2. The Bengal tiger (*Felis tigris*), a fierce beast of prey which sometimes, especially in old age, becomes a man-eater
3. Lioness (*Felis leo*), about a foot shorter than the adult male and generally considered more dangerous when attacked
4. Puma or mountain lion (*Felis concolor*), a large American cat extensively distributed from Canada to Patagonia. It is of a uniform colour
5. Tigress (*Felis tigris*), somewhat smaller than the male but equally vicious and aggressive, especially when protecting her young
6. Leopard cat (*Felis bengalensis*), a small, savage wildcat of tropical Asia that feeds largely on game birds
7. Ocelot (*Felis pardalis*), a fierce American forest cat ranging from Arkansas to Paraguay. Its fur is yellow or grey marked with spots
8. The red or bob-tail lynx (*Lynx rufus*), a North American species that ranges south to Mexico. It acquires a uniform rufous coat in summer
9. Jaguar (*Felis onca*), the largest of American cats. It ranges from Texas to Patagonia and sometimes develops into a man-eater
10. Cheetah or Hunting Leopard (*Cynaeurus jubatus*), so called because it is used in the hunting of game. It is a native of Africa and Asia
11. The snow-leopard (*Felis uncia*), a non-man-eating inhabitant of Central Asia. Its name is suggested by its grey spotted fur
12. Serval (*Felis serval*), an African wildcat that preys on small quadrupeds and is prized by the natives for its skin, which is a spotted yellow

FIG. 3.—PLAN OF PART OF THE CEMETERY OF S. AGNESE AT ROME

the gallery in Christian cemeteries, but in pagan areas the recess was usually at right angles. Some loculi held four or more bodies, most held one (fig. 5). They were carefully closed by slabs of marble or huge tiles cemented together. When an epitaph was set up, it was painted or engraved on these tiles. Table tombs and arched tombs are also found. Sarcophagi are rare. The family vaults—cubicula—were small apartments, usually rectangular, sometimes circular or polygonal, opening from the main corridors and frequently ranged regularly along the sides of the galleries. Loculi were cut for later burials in the same family area and the inscriptions and mural decorations were frequently damaged or destroyed. The funeral feast was celebrated by the family in its vault, both on the day of burial and on the anniversary. The Eucharist, the invariable accompaniment of funerals in the early Christian Church, was celebrated here, and in some of the catacombs are larger halls and connected suites of chapels which may have been constructed for congregational worship in the days of persecution (fig. 4). Baptisteries have been discovered. The catacombs were also used as places of refuge, for which they were admirably adapted, both by the intricacy of their design and by access through secret passages to sand quarries and the open country.

Almost without exception they had their origin in small burial areas, the property of private persons, and their great development was due to the spread of Christianity and the burial of the

FROM DENNIS

FIG. 2.—PLAN OF A PORTION OF THE PRINCIPAL STOREY IN THE POGGIO GAIELLA CEMETERY

dead in this manner conformed to Roman usage. There was no reason for secrecy and since interment in rock-hewn tombs had been practised in Rome by Jewish settlers before the rise of the Christian Church, the practice may well have been popularly, perhaps correctly, associated with the Jewish population which contributed elements to the new religious order. At a later period the grave diggers seem to have acquired or to have established a kind of property in the catacombs and to make new graves recklessly destroyed the religious paintings on the walls. The major part of the catacombs belong to the 3rd and early part of the 4th centuries. By A.D. 354 when St. Jerome visited them, interment in them had become rare. By the time of Pope Damasus (A.D. 366–384) they had become the resort of pilgrims. They were adapted to this by the orders of the pope. The works of art were restored. The epitaphs were renewed. In this latter work he employed an engraver named Furius Philocalus whose work can be recognized at once.

As a result the improvements described have lessened the value of the catacombs as memorials of the religious art of the 2nd and 3rd centuries. Subterranean interment ceased with the sack of Rome by Alaric in A.D. 410. The catacombs shared in the destruction of Rome by the Goths in the 6th century and by the Lombards at a later date. Pope Paul I. and Pope Pascha I. found them in such decay and pollution that the holy relics they contained were translated elsewhere and the catacombs soon ceased to attract pilgrims. By degrees their existence was forgotten and they were discovered by chance in 1578 and have been studied, explored, investigated and described by scholars such as Baronius, Antonio Bosio (d. 1629), Marc Antonio Boldetti (c. 1720), Seroux d'Agincourt (1825) Raoul Rochette and most notably in recent times by Father Marchi of the Society of Jesus. Additions to our knowledge have been made by de Rossi and include the rediscovery near the catacomb of Priscilla, on the Via Salaria Nuova,

of the Cosmeterium Jordanorum, first found in 1578 but soon afterwards choked up and lost. It is possible now to identify the tombs of martyrs like Nereus and Achilleus, said to have been baptized by St. Peter, who with their mistress Petronilla, of the Aurelian family and the spiritual daughter of St. Peter, suffered death for their faith under Domitian. Many of the names of persons mentioned in the Epistles of St. Paul are found here and every fresh excavation yields similar evidence.

FIG. 4.—SECTION OF GALLERIES AT DIFFERENT LEVELS IN THE CATACOMBS OF ROME

At Syracuse there are very extensive catacombs known as "the Grottos of St. John." There is an entire underground city with several storeys of larger and smaller streets, squares and cross ways cut out of the rock; at the intersection of the cross ways are great circular halls of a bottle shape, like a glass-house furnace, lighted by air shafts. The galleries are generally very narrow, furnished on each side with arched tombs, and communicating with family sepulchral-chambers closed originally by doors, the marks of the hinges and staples being still visible. The walls are in many places coated with stucco adorned with frescoes including palms, doves, *labara* and other Christian symbols. This cemetery differs widely in arrangement from the Roman catacombs.

The catacombs at Malta are near the ancient capital of the island. The passages were all cut in a close-grained stone, and are very narrow, with arched ceilings, running very irregularly, and ramifying in all directions. The greater part of the tombs stand on either side of the galleries in square recesses (like the table-tombs of the Roman catacombs) and are rudely fashioned to imitate sarcophagi. The interments are not nearly so numerous as in other catacombs, nor are there any vestiges of painting, sculpture or inscriptions. At Taormina in Sicily is a Saracenic catacomb, also figured by Agincourt. The main corridor is 12 ft. wide, having three or more ranges of *loculi* on either side, running longitudinally into the rock, each originally closed by a stone bearing an inscription.

In Egypt we find a small Christian catacomb at Alexandria. The *loculi* here also are set endways to the passage. The walls are abundantly decorated with paintings, one of a liturgical character. But the most extensive catacombs at Alexandria are those of Egypto-Greek origin, from the largest of which, according to

FIG. 5.—LOCULI IN CATACOMBS OF ROME. GRAVES OF URBICA AND RUFINA

Strabo (lib. xvii. p. 795), the quarter where it is placed had the name of the Necropolis. The plan is remarkable for its regularity (fig. 8). Here, too, the graves run endways into the rock. There are other catacombs in the vicinity of the same city.

Subterranean cemeteries of the general character of those described are very frequent in all southern and eastern countries. A vast necropolis in the environs of Saida, the ancient Sidon, consists of a series of apartments approached by staircases.

Recent Discoveries.—At Rome, after the death of de Rossi (1894) a small subterranean basilica in the catacomb of SS. Peter

FIG. 6.—THE PLAN OF THE CATACOMB OF S. JOHN, SYRACUSE

and Marcellinus on the Via Labicana, with pious acclamations on the plaster similar to those in the Papal crypt in St. Calixtus was discovered in 1896. In the cemetery of Domitilla in 1897-1898 a fine double crypt with frescoes representing Christ seated between six male and female saints and an inscription relating to a new saint (Eulalius) in a cubiculum of the 3rd century was brought to light. In 1899-1900 were discovered two opposite cubicula in the catacomb of SS. Peter and Marcellinus, both covered with frescoes, the vault being in one case decorated with the scene which represents Christ seated among the apostles and pronouncing sentence upon the defunct. An inscription discovered in 1900 on the site of the ancient cemetery of St. Ciriaca, and dating from A.D. 405, states that one Euryalus bought a site *ad mensam beati martyris Laurentii* from a certain *fossor* whose name has been erased, an example of what was known as *memoriae damnatio*, or the blotting out of a name on account of some dishonourable action. In 1901-1902 excavations in the cemetery of Santa Priscilla, near the Cappella Greca, revealed a polygonal chamber which may have originally been the *nymphaeum* of the great villa of the Acilii Glabriones. It may have been used as a burial-place for martyrs, and as the sepulchral chapel of Pope Marcellinus, who died in A.D. 304 during the persecutions of Diocletian. In 1902, in that part of the Via Ardeatina which passes between the cemeteries of Calixtus and Domitilla, was discovered a crypt with frescoes and the sanctuary of a martyr; this, rather than a neighbouring crypt brought to light in 1897, may prove to be the sepulchral crypt of SS. Marcus and Marcellianus. In a cubiculum leading out of a gallery

FIG. 7.—PLAN OF CIRCULAR HALL IN CATACOMBS OF S. JOHN, SYRACUSE

in the vicinity there was also discovered an interesting impression in plaster of an inscription of the mother of Pope Damasus, beginning:

Hic Damasi Mater Posuit Lavren (tia Membra).

In the same year building operations in the Via di Sant' Onofrio revealed the presence of catacombs beneath the foundations: examination of the *loculi* showed that no martyrs or illustrious

FIG. 8.—PLAN OF CATACOMB AT ALEXANDRIA

persons were buried here. Work was also carried out at the catacomb of Albano (Marucchi *Nuovo Bull.*, 1902, pp. 89 ff.).

In 1903 a new cemetery with frescoes came to light on the Via Latina, considered by Marucchi to have belonged to a heretical sect. In the same year the Jewish cemetery on the Via Portuense, was rediscovered. The subterranean basilica of SS. Felix and Adauctus, discovered by Boldetti and afterwards choked up with ruins, was cleared again: the crypt, begun by Damasus and enlarged by Siricius, contains frescoes of the 6th–7th centuries. In the same year extensive catacombs were revealed on the site of Hadrumetum near Sousse in Tunisia.

In 1907–08 interesting discoveries were made in the South East of Sicily (P. Orsi, *Notizie degli Scavi*, 1908). The year 1911 witnessed the discovery of the remarkable *hypogeum* of Trebius Justus on the Via Latina, with frescoes showing gnostic influence (*Nuovo Bull.* 1911 and 1912). In 1912 a catacomb was found at Grottaferata which has since been excavated by the Basilian monks. In 1915–1916 a *memoria* of SS. Peter and Paul was explored beneath the basilica of S. Sebastiano, *Ad catacumbas*, on the Appian way. *Graffiti* with invocations to these apostles, dating from the fourth century were discovered (Marucchi, *Nuovo Bullettino*, for 1916, 1917, 1919, 1920). In 1917 was found subterranean basilica of the first century, perhaps the work of a pagan *sodalitas* (g. Bagnani, *Journ. of Roman Studies*, 1919, p. 78). In 1919, not far from the Porta Maggiore and the ancient Via Labicana, a *hypogeum* with two frescoed chambers was dis-

covered. The subjects were unusual; one, Christ instructing his sheep from a book recalled a passage in the inscriptions of Abercius in the Lateran; others were scenes from the story of Job diverging from those usual in the Catacombs; a group of 12 figures, perhaps apostles, included two recalling the traditional types of SS. Peter and Paul (Marucchi, *Nuovo Bull.* 1921). The year 1921 witnessed the rediscovery near the catacomb of Priscilla on the Via Salatia Nuova, of the *Coemeterium Jordanorum*, first found in 1578 but soon afterwards choked up and lost (Marucchi and Josi, *Nuovo Bull.* 1922).

BIBLIOGRAPHY.—The classical work on the catacombs of Rome is G. B. De Rossi's *Roma sotterranea*. The volume by Mgr. Wilpert, *Le Pitture delle catacombe romane* (Rome, 1903), in which all the important frescoes are reproduced in colours, is complementary to the *Roma sotterranea*. All new discoveries made by the *Commissione di archeologia sacra* are chronicled in the *Nuovo Bullettino di archeologia* and the *Notizie degli scavi*.

For accounts of the catacombs see:—Armellini, *Gli Antichi Cimiteri cristiani di Roma e d'Italia* (Rome, 1893); O. Marucchi, *Le Catacombe romane* (Rome, 1903; also translated into French), *Manuale di epigrafia cristiana* (Milan, 1904); M. Besnier, *Les Catacombes de Rome* (Paris, 1909); F. X. Kraus (*Realencyklopädie und Geschichte der christlichen Kunst*) and Dom F. Cabrol's *Dictionnaire d'archéologie chrétienne et liturgie*, articles with bibliography, by H. Leclercq.

Among the older works are: Bosio, *Roma sotterranea*, Severano's edition (1632), and Aringhi's edition (1651); Boldetti, *Osservazioni sopra i cimiteri dei santi martiri* (Rome, 1720); Bottari, *Sculture e pitture sagre*, etc. (Rome, 1737–1754); Seroux d'Agincourt, *Histoire de l'art par les monuments* (Paris, 1823; German ed., 1840); G. Marchi, *Monumenti delle arti cristiane primitive* (Rome, 1844); Raoul Rochette, *Tableau des catacombes de Rome* (2nd ed., Paris, 1853); Perret, *Les Catacombes de Rome* (Paris, 1855)—a sumptuous folio work, but not always accurate; Roller, *Les Catacombes de Rome* (Paris, 1881); V. Schultze, *Die Katakomben* (Leipzig, 1882).

Works written in English are: Northcote and Brownlow, *Roma sotterranea* (London, 1869; based upon De Rossi); Wharton Marriott, *The Testimony of the Catacombs* (1870); J. H. Parker, *The Archaeology of Rome: the Catacombs*; Smith and Cheetham, *Dictionary of Christian Antiquities*, s.v. "Catacombs"; R. Lanciani, *Pagan and Christian Rome* (1892); W. Lowry, *Christian Art and Archaeology*, ch. ii. (1901; a useful introduction to the subject); H. Gee, "The Church in the Catacombs," in W. Lefroy's *Lectures in Ecclesiastical History* (1896); Th. Mommsen, in the *Contemporary Review* (May 1871).

The catacombs at Naples are described in C. F. Bellermann, *Über die ältesten christlichen Begräbnisstätten und besonders die Katakomben zu Neapel* (Hamburg, 1839); Armellini, as above and V. Schultze, *Die Katakomben von San Gennaro dei Poveri in Neapel* (Jena, 1877).

For the catacombs in Malta, A. A. Caruana, *Ancient Pagan Tombs and Christian Cemeteries in the Islands of Malta* (Malta, 1898), and A. Mayr, "Die altchristlichen Begräbnisstätten auf Malta," in *Römische Quartalschrift*, vol. xv. pp. 216 and 352 (Rome, 1901), and E. Becker, *Malta Sotterranea* (Strasbourg, 1913), may be consulted.

The fullest accounts of the Sicilian catacombs are given by J. Führer, *Forschungen zur Sicilia sotterranea* (Munich, 1897); C. Barreca, *Le Catacombe di San Giovanni in Siracusa* (Syracuse, 1906); J. Führer and V. Schultze, *Die altchristlichen Grabstätten Siziliens* (Berlin, 1907); and P. Orsi, *Per la Siracusa Sotterranea* (Catania, 1906).

A catacomb of the 5th century, discovered at Kertch in South Russia, is described by J. Kulakovsky in *Materials for Russian Archaeology* (St. Petersburg, 1896; a publication of the Russian Imperial Archaeological Commission), but it is written in Russian, as also is the account by V. Latyshev, in *Vizantieski Vremennik*, vol. vi. pp. 337 ff. (St. Petersburg, 1899).

The catacombs at Hadrumetum (Sousse) are described by A. F. Leynard, *Les Catacombes d'Hadrumète deuxième campagne de fouilles* (1904–1905). See also *Revue Tunisienne* (1905), p. 250.

For the catacombs of Alexandria, de Rossi in *Bull. di archeologia Cristiana* (Nov. 1864, Dec. 1865); Neroutsos Bey, *L'Antienne Alexandrie*. (W. R. B.; O. M. D.)

CATAFALQUE, a word of unknown origin, occurring in various forms in many European languages, meaning a funeral scaffold or temporary stage; a movable structure of wood, sometimes richly decorated, erected temporarily at funeral ceremonies in a church to receive the coffin or effigy of the deceased; also an open hearse or funeral car.

CATALAN. It is generally assumed that Catalan was imported from Roussillon into Spain during Carolingian times; the contrary view has, however, been put forward, namely that Catalan originally developed in Spain and was introduced into Cerdagne and Roussillon by Catalan immigration. Whatever the truth may be, philologically Catalan is to be regarded as pertain-

ing to the Provençal rather than to the Hispanic branch. Like Hispanic it changes *L. ū* into *u* and *L. au* into *o*, cf., *L. mūrum*, Cat. *mur*, *Hisp. muro* (Prov. *Fr. mur*); *L. aurum*, Cat. and *Hisp. oro* (Prov. *aur*, *Fr. or*). Unknown to Catalan, however, are the characteristically Hispanic diphthongizations of open *e* and open *o* in position, cf., *L. terra*, *Hisp. tierra*, but Cat. *terra*; *L. fortem*, *Hisp. fuerte*, but Cat. *fort* (as in Prov. and Fr.). Moreover Catalan and Provençal both change proparoxytones into paroxytones, whereas in Hispanic the proparoxytones are preserved, e.g., *L. anima*, Cat. and Prov. *alma*, *arma*.

Catalan is nowadays spoken in the major part of the department of the Pyrénées Orientales, in Andorra, at Alghero (Sardinia) whither it was brought by the Aragonese in the second quarter of the 14th century but where it is steadily succumbing to the disruptive influence of Italian and Sardinian; in the provinces of Huesca, Saragossa, Ternel; in the greater part of the provinces of Castellon de la Plana and Alicante; in much of the province of Valencia; and in the Balearic islands and Pithyusae, conquered by Jaime I. of Aragon (1229-34). The territory occupied by Catalan contains in Spain 4,486,000 inhabitants, in France some 200,000.

Catalan embraces two groups, viz., (A) continental, subdivided into (a) oriental, (b) occidental, (c) Valencian, (d) Roussillonais; (B) insular, subdivided into (a) dialects of the Balearic islands and Pithyusae, (b) dialect of Alghero. All these idioms present only minor phonetic differences. In the Balearic islands *es, sa* constitute the definite article (as also in the sub-dialect of oriental Catalan termed for this reason, *salat*) instead of *el, la*.

The outstanding difference between the Catalan of Spain and that of Roussillon, is that whereas the former is a real language with a flourishing literature, the latter is a mere patois.

BIBLIOGRAPHY.—P. Fouché, *Chronique philologique des parlers provençaux anciens et modernes* (Bibl.) in *Revue de linguistique romane* T. II. (Janvier-Juin, 1926) p. 113-136; A. Griera, *Le domaine catalan (compte rendu rétrospectif jusqu'à 1924)* in *Revue de linguistique romane* T. I. (Janvier-Juin, 1925) p. 35-113. These bibliographical articles will be continued in the following volumes. (L. B.)

CATALANI, ANGELICA (1780-1849), Italian opera-singer, was born at Sinigaglia, and was the lucky possessor of one of the most remarkable soprano voices, of extraordinary compass and purity, ever known. For nearly thirty years she sang at all the great opera houses, receiving very large fees; her first appearance in London having been at the King's theatre in 1806. She remained in England, a prima donna without a serious rival, for seven years. Then she was given the management of the opera in Paris, but this resulted in financial failure, owing to the incapacity and extravagance of her husband, Captain Valabrègue—author of the historic remark "ma femme et quatre ou cinq poupées voila tout ce qu'il faut"—whom she had married in 1806. But her continental tours continued to be enormously successful until she retired in 1828. She died of cholera in Paris.

CATALEPSY, a term applied to a nervous affection characterized by sudden suspension of sensation and volition, and rigidity of the whole or of certain muscles of the body. The subjects are mostly females of highly nervous temperament. The exciting cause of an attack is usually mental emotion, either sudden, e.g. a fright, or gradual, e.g. prolonged depression. The symptoms vary even in the same individual in different attacks. Sometimes there is complete insensibility, together with a statue-like appearance of the body which retains any attitude it may be made to assume during the continuance of the attack. In this condition the whole organic and vital functions appear to be reduced to the lowest possible limit consistent with life, and may simulate actual death. At other times excitement accompanies the cataleptic symptoms, and the patient sings or utters passionate exclamations, while quite unconscious. The attack may be short or may last for many hours, or even for several days; and it is conceivable that in such cases the appearances might be mistaken for real death, as is alleged to have occasionally happened. Although catalepsy is said to occur in persons in perfect health, careful inquiry will usually reveal some abnormality; in women, menstrual derangement is generally found to have preceded the affection. It is sometimes associated with epilepsy

and with grave forms of mental disease. In ordinary cases, however, the mental phenomena closely resemble those of hysteria. In many subjects of catalepsy there is weakness of the will, whereby the tendency to lapse into the cataleptic state is not resisted but encouraged, and attacks may thus be induced by trivial circumstances (see HYPNOTISM).

CATALOGUE, a list or enumeration, generally in alphabetical order, of persons, things, etc., and particularly of the contents of a museum or library. A *catalogue raisonnée* is such a list classified according to subjects or on some other basis, with short explanations and notes. (See also BIBLIOGRAPHY AND BIBLIOLOGY, and LIBRARIES.)

CATALOGUES AND PRICE LISTS. The preparation and distribution of catalogues and price lists has become an industry of enormous dimensions, the cost of printing and publishing amounting to millions of pounds per annum in Britain alone, while the expenditure of this sort in America is probably not less than sixty million dollars per annum. It is increasingly recognized that an attractive catalogue, distributed in the right way, is one of the best aids to salesmanship. The cost of production of fifty or a hundred thousand catalogues of moderate size amounts to a serious item in business expenditure. In not a few cases this leads to a cutting down of expense upon the preparation of the catalogue and this is undoubtedly the chief weakness in the preparation of commercial price lists. Another reason for the failure of many expensive catalogues is that the publisher forgets that, although he may be successful in manufacturing a certain article, it does not necessarily follow that he is successful in describing it for catalogue purposes. It is very important, therefore, that efficient literary aid should be called in by the business man to make his catalogues lucid. Thus, also, with any necessary pictures. Often the printing blocks in an expensive production have little artistic merit, and do not do full justice to the products. If we suppose ten thousand pounds to be spent upon a catalogue issue, the value of the expenditure may easily be doubled or trebled by spending an additional two hundred pounds upon the editorial work.

It is not difficult for the business man to forget in preparing a catalogue that those he wishes to read it are not as familiar with his productions as he is himself. Simplicity and lucidity of description are essential, and in this connection care should be taken to avoid the listing of a complexity of types. The excellent work done by the Washington Department of Commerce in reducing the number of types of products in various trades is directed to what is really the same point. Variety, of course, there should be, but the types chosen for listing should be distinctly different, and the reasons for the differences very clearly stated.

If, for example, the catalogue offers a series of gas heaters and cookers, the types chosen should not only be essentially different, but the essential differences should be made quite clear to the reader. If the stove is a heating appliance, the kind of room for which it is suited, the kind of flue needed, the method of installation, and the cost of maintenance should all be demonstrated. When prices vary in a series, the reason for the differences should appear. Nothing is more confusing or stultifying in a catalogue than to be told on one page that Type A of a certain manufacture is the "best," or the "finest," when the very next page refers to another thing of the same sort priced at a much higher figure. What should be done is to show clearly that the article priced is good value at its price; good value for its particular purpose; good value to meet a particular need.

The Listing of "Extras."—Every endeavour should be made in drawing up a catalogue to offer each article ready for use, at a price covering the entire equipment necessary to put it into use. Thus, at one time it was the unfortunate practice of motor-car manufacturers to offer their machines at a certain price, and then to add a long list of extras necessary to fit out the machine ready for the road. This practice has, happily, been abandoned in the automobile industry, but it still obtains in many other trades. First, the buyer is offered the article at a certain price, but this price does not represent the thing ready for use or consumption; a number of extras are listed in a confusing way so that the real

price of the article fit for use has to be worked out with more or less difficulty. The manufacturer of a machine-tool gains when he offers his product completely fitted with necessary safety-appliances; equally the manufacturer of a roofing felt is likely to increase his sales if his price list shows the material put into convenient rolls well packed, accompanied with the necessary amount of cement for the lapping of edges, and with purpose-made nails to fix it. The aim of every catalogue should be to offer the articles it lists ready for use.

The format of a catalogue is of great importance. The catalogue of a store should be divided into sections and well indexed. In the case of the small catalogue, or "folder," it is far better to concentrate upon one really good production at a time than to issue a sheaf of documents of different sizes which are only too likely to bewilder and irritate the would-be buyer. It is quite usual at trade exhibitions to be handed half a dozen differently shaped folders referring to a single object, instead of being given one handy, pocket-sized, beautifully printed, well-considered piece of printing.

An excellent aid to business in a catalogue, and one that is much appreciated by buyers, is the insertion of intelligent matter directly or indirectly relating to the articles offered. This may be illustrated by the case of a sports catalogue. The manufacturer of cricket-bats or tennis-rackets does well to include in his catalogue expert directions for the preservation of the articles sold, or hints on the laws of the game, or other interesting cognate matter. Again, the catalogue of a piano-player may well be accompanied by a lucid account of the invention, instructions for the care of the instrument, hints as to getting the best results from it, and so forth.

As to catalogues for the export market, it is an old complaint, and a just one, that their publishers too often fail to adapt them to the needs of the country to which they are supposed to appeal. If a catalogue is prepared for South America, for example, it is quite useless to prepare it in English; it should be translated into Spanish (or into Portuguese, if for Brazil) and weights and measures and prices expressed in their proper equivalents. Consular reports from foreign countries again and again dwell upon the neglect of these elementary measures for making an export catalogue useful.

CATALONIA (*Cataluña*), a captaincy-general, and formerly a province of Spain, formerly also a principality of Aragon; bounded on the north by the Pyrenees, west by Aragon, south by Valencia, and east by the Mediterranean Sea. Pop. (1926) estimated 2,431,142, area, 12,427 sq. miles. The triangular territory of Catalonia forms the north-east corner of the Iberian Peninsula. It was divided in 1833 into four provinces, Barcelona, Gerona, Lérida and Tarragona (*see* separate articles). The surface is much broken by southern spurs of the Pyrenees. Running south-west to north-east, and united on the north with one of the offsets of the Pyrenees, is the range of the Sierra Llena, which bisects Catalonia, and forms its central watershed. The principal rivers are the Ter, the Llobregat and the Ebro (*q.v.*), which all run into the Mediterranean. The coast is in places difficult but has important harbours, *e.g.*, Barcelona and Tarragona. Cut off orographically on the south and west Catalonia has had more associations with south France than with the Douro or Guadalquivir basins, and the Catalan language differs considerably from Castilian Spanish and has affinities with Provençal. Catalonia was one of the first of the Roman possessions in Spain, forming the north-eastern portion of Hispania Tarraconensis. About 470 it was occupied by Alans and Goths. It was conquered by the Moors in 712, but these invaders were in turn dispossessed by the Spaniards and the troops of Charlemagne in 788. Catalonia was subsequently ruled by French counts, who soon made themselves independent of France. By the marriage of Count Raymond Berenger IV. of Barcelona with Petronilla of Aragon, Catalonia became annexed to Aragon but this union was frequently severed. In 1640, when Philip IV. attempted to deprive Catalonia of its rights and privileges, it gave itself up to Louis XIII. of France. It was restored to Spain in 1659, and was once more occupied by the French from 1694 to 1697. Under Philip V. Catalonia, in 1714, was deprived

of its cortes and liberties. From 1808 to 1813 it was held by France. It was the scene of civil war in 1823, and of important revolutionary operations in the Carlist wars.

The average temperature varies from about 48° F in January to 75° F in July on the coast and the rainfall is about 21 inches with a maximum in September and October and a lower maximum in March and April. The dwarf-palm, orange, lime and olive grow in the warmer tracts; and on the higher grounds the thorn-apple, pomegranate, myrtle, esparto and heaths flourish. There is much woodland, but meadows and pastures are rare. Wheat, maize, millet, rye, flax, liquorice, vines and fruits of all sorts—especially nuts, almonds, oranges, figs and walnuts and chestnuts—are produced. Few cattle, but numbers of sheep, goats and swine are reared. Coastal fisheries are excellent. The wines are for the most part rough and strong, though good when matured. Catalonia was prominent in the wool industry early in the Middle Ages and in modern times the extended use of water-power for textile manufacture is making Barcelona an important industrial and commercial city. With the increase of irrigation the country around the city is being developed as a wheat growing area.

CATALPA, a genus of trees belonging to the family Bignoniaceae and containing about 10 species in North America, the West Indies and China. The best known is the common catalpa (*C. bignonioides*), native to the south-eastern United States, which is often cultivated in parks and gardens, both in Europe and America. It is a stately tree with large heart-shaped pointed leaves and panicles of white bell-shaped flowers streaked with yellow and brown purple. The western or hardy catalpa (*C. speciosa*), with larger flowers, found in woods from Indiana to Missouri southward to Tennessee and Arkansas, has become naturalized elsewhere through cultivation, especially south of its native range.

CATALYSIS. The term catalytic agent was introduced by J. J. Berzelius (1836) into chemistry to include those substances which by their presence accelerate the rate of reactions proceeding with a decrease in free energy towards equilibrium. In general, the catalyst provides an alternative path for the reaction; thus the chemical union of two components to form a product, $A+B \rightarrow AB$, may proceed directly or *via* a series of reactions, such as $A+X \rightarrow AX$, $AX+B \rightarrow AXB$, $AXB \rightarrow AB+X$, in which the substance X is a catalyst. In reversible systems catalysts must necessarily accelerate both forward and reverse reactions equally, since the equilibrium point cannot be affected by a material which acts solely as a catalytic agent. Catalytically accelerated reactions may be either homogeneous or heterogeneous in character, the former taking place in gases and liquids, the latter at interfaces, more especially at gas-solid and liquid-solid interfaces.

Catalysts both in homogeneous and heterogeneous systems theoretically possess an indefinite life, but in practice loss generally occurs, (a) through side reactions unconnected with the main reaction, as in the gradual reduction of sulphuric acid in the etherification processes; (b) through the formation of inactive compounds with impurities present in the reactants, as in the formation of nickel sulphide from sulphur compounds present as impurity in hydrogen employed in hydrogenation (*q.v.*) processes; (c) through removal from the reacting system either by vaporization, as in the case of catalysis of platinum in the formation of sulphur trioxide, or by coagulation, such as occurs in colloidal metal catalysts employed for hydrogenation; (d) through sintering and fusion due to overheating of the active surfaces.

Catalysis in Gas Reactions.—Simple collision between the molecules of two reacting gases is not sufficient to ensure reaction. In general but a small number of such collisions are effective in promoting chemical reaction, the number of these effective collisions rising, in the case of bimolecular reactions, exponentially with the temperature. It was first suggested by Arrhenius that effective collisions were those which took place between excited or active molecules, whilst normal molecules did not so react. In the majority of cases it is sufficient to assume that excited or active molecules are produced not prior to but in the act of collision itself. It is yet unknown whether the excited molecule resulting in collision possesses a transitory existence before reac-

tion, or whether excitation and reaction are simultaneous processes. An activating collision results when the energy available for activation exceeds a critical value, the "critical energy increment." The source of this energy is, in simple molecules, the kinetic energy available on collision; in complex molecules it appears that part or all of the potential energy in the molecule can supplement the kinetic. The fraction of the total number of collisions effective will be dependent both on the complexity of the molecule and the magnitude of the critical energy increment. Introduction of a catalyst may augment the velocity of a reaction by effecting a two-stage reaction with two small critical energy increments, as alternative to a one-stage reaction, with a large value for the critical increment. Although the catalytic influence of small quantities of water on the rate of many chemical reactions (*e.g.*, certain combinations of sulphur dioxide; or the thermal combination of hydrogen and chlorine) has long been established, the mechanism of any one of these reactions is not sufficiently well known to establish beyond doubt their homogeneous nature.

We have noted that only certain high-speed collisions between normal molecules effect chemical reaction, but similar results may be obtained by slow-speed collision provided that one of the colliding molecules already possesses sufficient potential energy available on collision to effect the required chemical change. These potentially active or excited molecules may be generated from the normal species by photochemical means, and thus they serve as catalysts or photosensitizing agents in what are primarily photochemical reactions. The case of the catalysis of the union of hydrogen and oxygen by light of wave length $\lambda = 2537$ may be cited. These gases do not combine with appreciable speed at ordinary temperature when exposed to radiation of this frequency. On the addition of a small quantity of mercury vapour, however, rapid combination is effected. The energy of activation for the hydrogen-oxygen combination is supplied, as shown by Franck and Caro, by collision with mercury atoms which by the absorption of radiation have been converted into excited mercury atoms. Numerous similar gas reactions may be carried out with similar photosensitizing catalysts which include, not only mercury in effecting hydrogenation of oxygen, carbon monoxide and ethylene or the decomposition of ammonia, but also bromine and chlorine in the decomposition of ozone. In considering the equilibrium point attained when such photocatalysts are employed, not only the active masses of the reactants, but likewise the radiation density must be taken into consideration.

In the recombination of atomic hydrogen to the molecular state it is evident that the resultant molecule is not stable unless the energy of dissociation can be liberated on association. If the resultant molecule possesses an electric moment, this energy which must be liberated can escape in the form of radiation, but for molecules possessing small or no electric moments such radiation cannot take place, and thus atomic recombination does not occur. If, however, molecules are present, intermolecular collisions between two atoms and a molecule may result in the transfer of part or all of the superfluous energy to the molecule, and the atoms can combine the molecules thus acting in a catalytic manner. The recombination of bromine atoms is apparently facilitated by the presence of bromine molecules.

Finally mention may be made of the catalytic influence of ions in chemical reactions. In the case of polymerization of acetylene, the energy of activation may be supplied by the recombination of ions of other and indifferent gases. Around each ion both positive and negative clusters of acetylene molecules are formed, and on reaction of these ions with each other the acetylene clusters absorb the energy set free on recombination and are converted into the polymeride.

Catalysis in Solution.—In solution, cases of catalytic acceleration of reactions are common, the classical examples being the catalytic activity of oxonium (H_3O^+) and hydroxyl (OH^-) ions on hydrolytic changes such as ester hydrolysis or sugar inversion. Other ions exert in many cases marked specific effects, such as the iodide ion in the decomposition of hydrogen peroxide, the chloride ion in the decomposition of chloramine, organic amines in the hydrolysis of nitramide, and the ions of polyvalent

elements such as barium, vanadium and chromium in oxidation processes. In the majority of these catalysed reactions an adequate explanation for the mechanism is found in the hypothesis that the reactants and catalyst form a critical complex or quasi-compound. This complex is always in equilibrium with the reactants and can either revert back to the original reactants or undergo a change resulting in the formation of the products. If A and B react to produce C in a reaction catalysed by X, the hypothesis can be expressed in the form

The rate of reaction is determined by two factors—the concentration of the quasi-compound (ABX), and its specific reaction rate R. For extremely dilute solutions the reaction rate is given by the expressions $dx/dt = k(\text{ABX}) = kK\text{C}_\text{A}\text{C}_\text{B}\text{C}_\text{X}$. If the reactants or catalysts are electrolytes, even dilute solutions are no longer ideal and the equilibrium of the reaction (1) is no longer dependent on the concentrations but, as Guldberg and Waage first observed, on the active masses of the reactants. If the relationship between the active mass and the concentration is expressed by the relationship $a_\text{A} = f_\text{A}\text{C}_\text{A}$, where f_A is the activity coefficient, the equilibrium constant K of the quasi-compound (ABX) is given by

$$K = \frac{\text{C}_{\text{ABX}} f_{\text{ABX}}}{(\text{C}_\text{A} f_\text{A}) (\text{C}_\text{B} f_\text{B}) (\text{C}_\text{X} f_\text{X})}$$

or the reaction velocity in solutions is given by

$$dx/dt = k(\text{ABX}) = kK(\text{C}_\text{A} f_\text{A}) (\text{C}_\text{B} f_\text{B}) (\text{C}_\text{X} f_\text{X}) / f_{\text{ABX}}$$

This generalization is further simplified by the observations of Milner, Brönsted, Debye and Hückel that in dilute solutions the activity coefficients of the various reacting species f_A , f_B , f_C , etc., are almost completely determined by the concentrations and valencies of the reacting species, and are given to a fact approximated by an equation of the form $\log_e f = -A Z_+ Z_- / \sqrt{C} + BC$, where Z_+ Z_- are the products of the valencies of the ions in a reacting salt of concentration C. We thus can classify reactions in solutions into various types: *see* ELECTROLYSIS.

Type 1. The catalytic agent is a simple ion causing reaction in a neutral molecule in the presence of a large excess of the other reactant. This type includes most of the catalytic reactions involving oxonium and hydroxyl ions, such as the mutarotation of glucose, ester hydrolysis, the decomposition of diazoacetic ester and nitrosotriacetoneamine, as well as the decomposition of nitramide by salts and acids. If in ester hydrolysis the concentration of the ester be represented by $[E]$ and that of the catalytic oxonium ion by $[\text{H}_3\text{O}^+]$ we obtain for the reaction velocity the expression

$$dx/dt = k[E \cdot \text{H}_3\text{O}^+ \cdot \text{A}] = kK[E]f_0[\text{H}_3\text{O}^+]f_1/f_2 = kK[E][\text{H}^+]f_0$$

where f_0 , f_1 , f_2 , etc., are the activity coefficients for neutral molecules, univalent and divalent ions, respectively.

Type 2. The catalytic agent consists of two ions of opposite sign causing reaction in a neutral molecule present in dilute solutions. This type includes the decomposition of hydrogen peroxide by the ions of hydrogen iodide and hydrogen bromide. The relationship expressing the reaction velocity in terms of the concentrations and activity coefficients of the reacting species is

$$dx/dt = k[\text{H}^+ \text{I}^- \text{H}_2\text{O}_2 \cdot \text{I}'] = kK[\text{H}_2\text{O}_2]f_0f_1[\text{H}^+]f_2[\text{I}'] / f_3 = kK[\text{H}_2\text{O}_2]f_1^2[\text{H}^+][\text{Cl}^-].$$

We have noted that many sugars undergo mutarotation, the velocity of which is accelerated by the addition of acids, and have seen that the formal representation of the reaction velocity in terms of the activities and concentrations is readily deduced on the assumption of the transitory existence of a quasi-compound or intermediary complex involving the oxonium ion H_3O^+ and the sugar. It follows that not only do free oxonium ions in solution exert a catalytic influence, but also any substance which is capable of reacting with the sugar to yield such a complex will likewise be catalytically active. These have been termed *proton*

donators and include such substances as the weak acids, the NH_4^+ ion, the HSO_4^- ion, the complex cobaltamine ion $[\text{Co}(\text{NH}_3)_5, \text{H}_2\text{O}]^{++}$. In addition to acids, bases likewise catalyse the hydrolysis of esters and the mutarotation of sugars. Included in the bases are all substances which are capable of reacting with a hydrogen or oxonium ion, such as the anions of acids, e.g., the SO_4^{--} or acetate ions, neutral pyridine, and basic complex ions of the type $[\text{Co}(\text{NH}_3)_5\text{OH}]^{++}$. This acid and basic catalysis can be expressed in the form of simple equations representing a species of hydrogen displacement or electrolytic action. Denoting the sugar by HG we obtain

In non-aqueous solutions it is likewise assumed that a quasi-compound or association complex between reactants and catalyst is first formed, and here the solvent may act both as solvent and as catalyst. Whilst the energy of activation determined from the temperature coefficient in the case of gaseous bimolecular reactions defines the reaction rate fairly accurately, reactions with large energies of activation proceed but slowly at low temperatures. This is not the case for reactions in non-aqueous solutions, an indication that the formation or change of the reacting complex must involve an interaction of some kind with the solvent molecules. The following data on the rate of addition of aniline to bromoacetophenone in various solvents exemplify this fact:

| Solvent | Energy of activation (Cals. per gm.-mol.) | Velocity coefficient of reaction |
|------------------------|--|-------------------------------------|
| Benzene | 8,088 | 0.000985 |
| Chloroform | 10,700 | 0.00186 |
| Methyl alcohol | 12,440 | 0.0748 |
| Ethyl alcohol | 13,900 | 0.0624 |

Catalysis at Solid Surfaces.—Many reactions, such as the combination of hydrogen with ethylene, proceed readily at ordinary temperatures when the reactants are exposed to the clean surfaces of certain metals such as platinum or nickel. Thanks chiefly to the work of Faraday, Bodenstein and Langmuir, it is now established that these reactions actually proceed on the surface of the metal, which is thus a true catalyst. Many industrial operations are now conducted through the agency of such contact agents or surface catalysts; amongst the more important of these may be mentioned the synthesis and oxidation of ammonia, the preparation of sulphuric anhydride (*see* SULPHURIC ACID), the synthesis of methanol and hydrocarbons from water gas, and the hydrogenation (*q.v.*) of numerous unsaturated organic compounds, including the fats. In the fine-chemical industry the introduction of the methods of Sabatier has resulted in simple methods for the preparation of numerous compounds, such as cyclohexane, "decalin," phthalic anhydride, acetic acid and acetone.

In some cases the rate of reaction is dependent on the rate of diffusion of the reactants to, or of the products from, the surface; this is more frequently the case in reactions which involve either the interaction of a gas and a liquid at a solid surface or combustible reactions taking place at relatively high temperatures; but in the majority of cases of low temperature catalysis the reaction proceeds sufficiently slowly to ensure attainment of equilibrium between the adsorbed gas and the gas in close proximity to the catalyst. For such reactions several different types of surface action can readily be identified. In a number of cases, such as the decomposition of alcohols at a copper surface or the hydrolysis of sugars by certain enzymes, the reaction rate is independent of the concentration of the reactant; we may regard the catalyst surface as being saturated with reactant over the whole range of concentrations, and the rate of reaction measured is consequently merely the rate of liberation of the products of reaction from the surface. In some cases, e.g., the decomposition of ozone at a silver surface, every molecule striking the surface appears to undergo decomposition, and the rate of reaction is consequently strictly proportional to the partial pressure of the

reactant. It is evident that for low concentrations of reactant or an inactive catalyst, the first case, viz., a zero-order reaction may be transformed into one of this second or unimolecular type.

For bimolecular reactions, e.g., the hydrogenation of ethylene at metal surfaces or the oxidation of oxalic acid in solution at carbon surfaces, the reaction velocity is a function of the concentrations of both of the reactants and attains a maximum at some suitable ratio of the reactant concentrations. At this point the reactants are adsorbed in the optimum ratio for interaction. Occasionally the reaction products inhibit the reaction; thus the sulphur trioxide formed in the catalytic union of sulphur dioxide and oxygen, and the oxygen set free in the catalytic decomposition of nitrous oxide hinder the reactions by which they are formed. In these cases the reaction products do not volatilize immediately on formation from the surface but are relatively strongly adsorbed, so that, in effect, the area of surface available for reaction is reduced.

Poisons and Promoters.—Active surfaces, as first noted by Faraday, are extremely susceptible to impurities, and the rate of reaction may be very seriously affected by even small quantities of suitable poisons. It is not difficult to detect extraordinarily minute concentrations of materials, such as cyanides, by their effect in reducing the catalytic power of platinum in the decomposition of hydrogen peroxide. Such poisons are strongly adsorbed, and differ only in the length of life on the surface from the many products of reactions which may exert an inhibiting action on the reaction by adsorption. In technical processes, the methods of elimination of poisons such as carbon monoxide and sulphur compounds from hydrogen have to be elaborate and efficient, and a large fraction of the total cost of a process may be incurred by the purification processes.

The quantitative study of poisoning action has revealed the fact that, for low temperature catalysis at least, only a small quantity of poison is necessary to effect complete destruction of the catalytic activity. This result has led to the view that only a small fraction of the surface is catalytically active, or that the seats of catalytic activity are active parts small in area and distributed irregularly over the surface of the catalyst. These active patches likewise appear to be differentiated from the remainder of the catalyst surface in other ways; thus, they are much more susceptible to the influence of temperature which effects sintering of the material, and on adsorption of many gases the heat evolution is markedly different from that occurring on adsorption on the remainder of the material. At high temperatures the differentiation between the active patches and the rest of the surface is not so marked, and the whole surface appears to be nearly uniform in catalytic activity.

The efficiency of a given weight of catalyst is dependent on the specific surface of the active patches at low temperatures and on the total surface at high temperatures. Such a desired increase in surface may be effected by utilization of catalyst supports such as magnesium sulphate or asbestos (*see* SULPHURIC ACID) for the distribution on their surfaces of catalysts such as platinum or vanadium pentoxide. Nickel oxide can be employed as a support for nickel employed in processes of hydrogenation.

It has been noted that an increase in catalytic activity for a certain weight of material may be obtained, not only by effecting an increase in the specific surface, but also by incorporating into the material other substances termed *promoters*. The catalytic efficiency is found to be greater for such promoted catalysts than for either constituent singly. In industrial practice the use of promoted catalysts is now general, e.g., iron-potash-alumina mixtures for the ammonia synthesis, iron and chromium oxides for obtaining hydrogen from water gas, and zinc and chromium for the synthesis of methanol. (*See* METHYL ALCOHOL.) Two views have been advanced as to the function of promoters. By some, it is considered that the reaction accelerated by the promoted reaction is in reality a two-stage reaction in which the velocity of one stage are greatest on one constituent and that of the second stage greatest on the other constituent. In the hydrogenation of carbon monoxide one stage may be regarded as an association of carbon monoxide and hydrogen to form a methanolic complex,

and the second stage might be considered as a dehydration of this complex. Nickel promoted with dehydrating catalysts is particularly effective for this reaction. The alternative view is based upon early observations of Faraday that perfect crystals of a hydrated salt do not effloresce in a dry atmosphere, but on scratching, efflorescence spreads from the patch throughout the crystal. The molecules at phase interfaces appear to exist in a particularly labile condition. This observation can be readily confirmed in the auto-accelerated decomposition of many solids, and in the reduction of copper oxide by hydrogen, which only takes place at the boundary between the oxide and the metal. Promoted catalysts are characterized by the presence of numerous discontinuities in the composition of the surface phase, and it is to be anticipated that, if surface actions take place more readily at these points, it is possible that catalytic actions on these discontinuities may likewise proceed more easily. The mechanism by which such reactions take place on surfaces is unknown; there is ample evidence that in complex organic molecules adherence to the surface is effected by certain portions of the molecule, thus primary fatty alcohols adhere to a copper surface by means of their $-\text{CH}_2\text{OH}$ group and it is in this group that reaction takes place.

Heterogeneous catalysts include the colloidal catalysts, both organic (the enzymes) and inorganic (colloidal platinum and palladium). The former are remarkable in that some of them are almost specific in their action, whilst both are characterized by possessing a specific reacting surface which is liable to great modifications with small changes in environment. We find also, as is the case in the decomposition of hydrogen peroxide or in the oxidation of benzaldehyde, that the walls of the containing vessel, as well as particles of dust in the liquids, may readily provide surfaces which possess catalytically active portions.

Inhibitors.—Whilst catalysts accelerate the course of a reaction certain substances can hinder or even entirely stop a reaction. These are termed inhibitors. Several of these are of technical importance and are sometimes known as stabilizing agents; thus acetanilide will stabilize hydrogen peroxide against decomposition, hydroquinone (quinol) will inhibit acrolein from polymerization, and iodine will inhibit benzaldehyde and cellulose acetate from autoxidation. In many cases a simple explanation for the inhibition of a reaction by the addition of such substances is to be found in the hypothesis that the inhibitor removes a catalyst. Often the catalyst consists of dust particles on the walls of the containing vessel on which the inhibitor is selectively adsorbed and thus effects a poisoning action. Some investigators incline to the view that the removal, diminution in concentration, or poisoning of a positive catalyst by the inhibitor is not sufficient as an explanation of the results. They believe that many such reactions which can be inhibited are chain reactions in the sense that the reaction is propagated as a chain through the gas or liquid by a reacting molecule setting off another with which it comes in contact. An inhibitor, it is imagined, breaks the chain and thus slows down the reaction. (E. K. R.)

Freundlich, *Colloid and Capillary Chemistry*, trans. H. S. Hatfield (1926), and numerous articles in the *Journal of the Chemical Society*.

CATAMARAN: see NAUTICAL TERMS.

CATAMARCA, an Andean province of the Argentine Republic, lying between 26° and 30° S. lat. and 65° and $69^\circ 30'$ W. longitude. It is bounded on the north by the territory Los Andes and the Province of Salta, east by the provinces of Tucumán and Santiago del Estero, south by the provinces of Córdoba and La Rioja and west by Chile from which it is separated by the Andes. Its total area is approximately 30,178 square miles.

The surface of the province is extremely broken, the Andes forming its western boundary, and the Aconquija, Ancaste, Ambato, Gulampaja and other ranges traversing it from north to south. It is composed very largely of high plateaux with a general slope southward broken by a few fertile valleys. The greater part of the province is arid and barren; an exception being the western slopes which are covered with forests. The rivers are small, and

some of them are lost in the barren, sandy wastes. Others, in the foot-hills of the high Sierras, are utilized to irrigate the valleys. The only lakes of any considerable size are the two fresh water bodies Tesoro and Tejas and the two salt lakes, Blanca and Colorado. There are also extensive salt flats. The climate varies with altitude, some of the sheltered valleys are extremely hot, while on the open plateaux the air is cool and bracing.

The mineral resources of the province include gold, silver, copper, lead, iron, tin, salt, nitrate of soda, gypsum and clay, but of these only copper is mined extensively, and this chiefly in the Capillitas district. Agriculture is confined to the limited amount of land under irrigation. Cereals, alfalfa and fruit are the chief crops. Wine of an excellent quality is produced and exported. The live stock industry has always been handicapped by poor vegetation and prolonged droughts; however, a considerable number of cattle and sheep are fattened in the alfalfa fields and then driven into northern Chile across the San Francisco pass. Weaving cloth from Vicuña wool and the tanning of leather are the chief manufacturing industries. The province is traversed by the western division of the Northern Central Argentine railway between Córdoba and the city of Catamarca, its capital. This route passes around the southern extremity of the Sierra de Ancaste and makes a long detour to Chumbicha, near the Rioja frontier; only few roads exist, and they are extremely bad.

Catamarca had according to the census of 1914, a population of 109,391, of whom only 2,281 were foreign. An official estimate made in 1925 put the total population at 115,608. The majority of the inhabitants are largely mixed with Indian blood. The chief city of the province is Catamarca (15,000), the capital, situated on a fertile table-land and picturesquely enclosed by hills. Other centres of population are Chumbicha, Andalgalá, Belén, Tinogasta and Pomán. Belén, founded in 1550, is the oldest Spanish settlement in the province, it being called Barco at first.

CATAMARCA (*San Fernando de Catamarca*), capital of province of same name on Río del Valle de Catamarca, Argentina, 230 m. (318 m. by rail) N.N.W. of Córdoba. Pop. (1914) 13,262, with a large percentage of mestizos. Catamarca is connected by railways with Rioja and Patquía and with Córdoba. The city stands in a narrow, picturesque valley at the foot of the Sierra de Ambato, 1,772 ft. above sea-level. The valley is highly fertile, partially wooded, and produces fruit in abundance, wine and some cereals. In the city are flour mills and tanneries, and among its exports are leather, fruit, wine, flour and a curious embroidery for which the women of Catamarca have long been famous. There is a fine church and a national college occupies the old Merced convent. The alameda is one of the prettiest in the Argentine Republic, having a reservoir of 2 ac. surrounded by shrubbery and walks. Catamarca was founded in 1685 by Fernando de Mendoza because the town of Chacra, the former provincial capital, a few miles north of Catamarca, had been found unhealthy and subject to inundations. Previous to the selection of Chacra as the provincial capital, the seat of government was at San Juan de Londres, founded in 1558 and named after the capital of England by order of Philip II. in honour of his marriage with Queen Mary. The arid surroundings of Londres led to its partial abandonment and it is now a mere village. Cholla, a suburb of Catamarca, is inhabited wholly by Calchaquí Indians, a remnant of the original inhabitants of this region.

CATANIA, a city and episcopal see of Sicily, the chief town of the province of Catania, on the east coast, 59 m. by rail S. of Messina, and 151 m. by rail S.E. of Palermo (102 m. direct). Pop. (1921), 234,871 (town), 253,658 (commune). The cathedral of S. Agatha, with relics of the saint, retains its three original Norman apses (1091), but is otherwise baroque and there are other good baroque churches and palaces. In the west the huge Benedictine abbey of S. Nicola (now suppressed) occupies about 21 ac. and contains the museum, a library, observatory, etc. This was the highest point of the ancient city, which lay almost entirely to the west of the modern Via Stesicorea Etuca, which runs for 3,000 yd. in a straight line towards the summit of Mt. Etna. The university, founded in 1444, has regained some of its former importance. To the south near the harbour is the massive Castell

'Ursino, erected in 1232 by Frederick II. The Roman theatre (no Greek theatre has been found) has been superimposed upon the Greek building, some foundations of which, in calcareous stone, of which the seats are also made, still exist. It is 106 yd. in diameter, and is estimated to have accommodated 7,000 spectators. Close to it are the remains of the so-called Odeum, of similar plan to the theatre but without a stage, and to the north is the church of S. Maria Rotonda, originally a Roman domed structure, perhaps part of a bath. To the north, in the Piazza Stesicoro, is the amphitheatre, a considerable portion of which has been uncovered, including a part of the arcades of the exterior already excavated. The external diameters of the amphitheatre are 410 and 348 ft., while the corresponding diameters of the arena are 233 and 167 ft. It is thus the third largest Roman amphitheatre known, being surpassed only by that at Verona and the Colosseum. Remains of many other Roman buildings also exist beneath the modern town, among the best preserved of which may be noted the public baths (*Thermae Achilleae*) under the cathedral, and those under the church of S. Maria dell' Indirizzo. The number of baths is remarkable, and gives some idea of the luxury of the place in Roman times. The majority were excavated by Prince Ignazio Biscari (1719-86). Some monumental Roman tombs have also been found, and it is only from their position that we can infer the boundaries of the Roman city, for no remains of its walls exist.

Catania exports sulphur, pumice stone, asphalt, oranges and lemons, almonds, filberts, cereals, wine and oil. The harbour is a good one: 6,294 ships of a total tonnage of 3,196,452 entered and cleared the port in 1926, and 630,188 tons of merchandise were dealt with. Sulphide of carbon is produced here; and there are large dyeworks.

The ancient Catina (Gr. *Katane*, Rom. *Catina*¹) was founded in 729 B.C. by colonists from Naxos, perhaps on the site of an earlier Sicel settlement—the name is entirely un-Greek, and may be derived from *κάτινον*, which in the Sicel language, as *catinum* in Latin, meant a basin, and would thus describe the situation. Charondas, a citizen of Catina, is famous as its lawgiver, but his date and birthplace are alike uncertain; the fragments preserved of his laws show that they belong to a somewhat primitive period. The poet Stesichorus of Himera died here. Very little is heard of Catina in history until 476 B.C., when Hiero I. removed its inhabitants to Leontini, repopled it with 5,000 Syracusans and 5,000 Peloponnesians, and changed its name to Aetna. In 461 B.C., however, with the help of Ducetius and the Syracusans, the former inhabitants recovered possession of their city and revived the old name. Catina was, however, an ally of Athens during the Syracusan expedition (415-413 B.C.), and served as the Athenian base of operations in the early part of the war. In 403 B.C. it was taken by Dionysius of Syracuse, who plundered the city, sold the inhabitants into slavery and replaced them with Campanian mercenaries. In the First Punic War it was one of the first cities of Sicily to be taken by the Romans (263 B.C.). In 123 B.C. there was an eruption of Etna so violent that the tithe on the territory of Catina payable to Rome was remitted for ten years. It appears to have flourished in the first century B.C., but to have suffered from the ravages of Sextus Pompeius. It became a Roman colony under Augustus, and it is from this period that the fertile plain, hitherto called the plain of Leontini, begins to be called the plain of Catina. It seems to have been at this time the most important city in the island, to judge from the language of Strabo and the number of inscriptions found there. In A.D. 251 a lava stream threatened the town and entered the amphitheatre, which in the time of Theodoric had fallen into ruins, as is clear from the fact that he permitted the use of its fallen stones for new buildings. It was occupied by Belisarius in 546, sacked by the Saracens in 902 and taken by the Normans. The latter founded the cathedral; but the town was almost entirely destroyed by earthquake in 1170, and devastated by Henry VI. in 1197. It became the usual residence of the Aragonese viceroys of the 13th and 14th centuries, and one of them, De Vego, reconstructed the fortifications in 1552. In 1669 an eruption of Etna partly filled up the harbour,

but spared the town, which was, however, almost entirely destroyed by the earthquake of 1693. Since then it has not suffered from its proximity to Etna, though all land communication between it and Messina was cut by the disastrous eruption of Nov., 1928.

See A. Holm, *Catania Antica* (trans. G. Libertini) (Catania, 1925); F. de Roberto, *Catania* (Bergamo, Arti Grafiche, 1907).

CATANZARO, a town and episcopal see of Calabria, Italy, capital of the province of Catanzaro, 1,125 ft. above sea-level. Pop. (1921) 23,463 (town); 36,138 (commune). The station for the town (Catanzaro Sala) is on a branch connecting the two main lines along the east and west coasts of Calabria, 6m. N. by W. of Catanzaro Marina on the east coast, and 20m. E. of S. Eufemia Biforcazione, on the west coast line. The town enjoys a comparatively cool climate in summer, and commands fine views. Numerous wealthy families reside here, and the town is clean and well built.

CATAPHYLL, a botanical term for the early leaf-forms produced in the lower part of a shoot, such as bud-scales, or scales on underground stems.

CATAPULT, a generic name for warlike engines of the cross-bow type used by the ancients (Lat. *catapulta*, Gr. *καταπέλτης*). (See ENGINES OF WAR.) They are usually classed as (a) catapults and (b) ballistae (*λιθοβόλοι*). The former were smaller and were used with arrows for what is now called direct fire (*i.e.*, at low angles of elevation); the latter were large siege engines discharging heavy bolts or stones at a high angle of elevation, like the modern howitzer.

The essential parts of the catapult (see illustration) were the frame, the propelling gear, the trough (corresponding to the modern barrel) and the pedestal. The frame consisted of two horizontal beams forming top and bottom sills, and four strong upright bars mortised into them. The three open spaces or compartments resembling narrow windows, between these four uprights, carried the propelling and laying gear. The propelling gear occupied the two outer "windows." In each a thick skein of cord or sinews was fastened to the top and bottom sills and tightly twisted. The stiff wooden arms were inserted in the two skeins, and a specially strong bowstring joined the tips of these arms. In the middle compartment was the hinged fore-end of the trough, which was at right angles to the frame and at the back of it. The trough

CATAPULT USED IN ANCIENT SIEGE WARFARE

This engine, capable of discharging a 26 in. arrow weighing $\frac{1}{2}$ lb., had an effective range of 400 yards

could be laid for elevation by a movable prop, the upper end of which was hinged to the trough, while the lower ran up and down a sort of rail fastened to the pedestal. The whole equipment was laid for "line" by turning the frame, and with it the trough, prop and trail by a pivot in the head of the pedestal. Sliding up and down in the trough was a block, fitted with a trigger mechanism, through which passed the middle of the bowstring. The pedestal was a strong and solid upright resting upon, and strutted to, a framework on the ground; its upper end, as mentioned above, took the pivot of the frame and the head of the trail.

On coming into action the machine was laid for direction and elevation. The block and with it the bowstring was next forced back against the resistance of the twisted skeins to the rear end of the trough, this being effected by a windlass attachment. The trigger being then pressed or struck with a hammer, the bowstring was released from the block, the stiff arms were violently brought back to the frame by the untwisting of the skeins, and the arrow was propelled through the centre "window" with great velocity. A small machine of the type described weighed about 85 lb., and sent a "three-span" (26 in.) arrow weighing $\frac{1}{2}$ lb. at an effective man-killing velocity somewhat over 400 yds.

¹This is the form vouched for by the inscriptions.

The ballista was considerably larger and more expensive than this. In Scipio's siege train, at the attack of New Carthage (Livy xxvi. 47, 5), the number of the ballistae was only one-sixth that of the catapults. In the ballista the rear end of the trough (which projected in front of the frame) always rested upon the ground, or rather was fixed to the framework of the pedestal—which was a heavy trestle construction—and the trough was thus restricted to the angle of elevation, giving the maximum range (45°). Even so, the range was not appreciably greater than that of a catapult, and in the case of the largest ballistae (90-pounder) it was much less. These enormous engines, which, once in position, could not be laid on any fresh target, were used for propelling beams and stones rather than for shooting arrows, that is, more for the destruction of material than for man-killing effect. The skeins that supplied the motive force of all these engines were made of the sinews of animals, twisted raw hide, horsehair rope, and, in at least one celebrated case, of women's hair. In 146 B.C., the authorities of Carthage, having surrendered their engines to the Romans in the vain hope of staying their advance, new ones were hurriedly constructed, and the women and virgins of the city cut off their hair to supply the needed skeins.

The modern implement known as a "catapult" is formed by a forked stick, to the forks of which are attached the ends of a piece of elastic. To the middle of this elastic a pocket is fitted to contain a bullet or small stone. In use the forked stick is held in the left hand and the pocket drawn back with the right. Aim is taken and, the pocket being released, the missile flies through the fork of the stick. Though classed as a toy, this weapon can do considerable execution among birds, etc., when skilfully used. The name of "catapult" has also been given to a bowling machine which is used for cricket practice.

CATARACT, a waterfall (Gr. *καταράκτης*, a floodgate, or waterfall, something which rushes down). The earliest use in English is of a floodgate or portcullis, and this survives in the name of a disease of the eye (see EYE, DISEASES OF; OPHTHALMOLOGY). The term is also used of a device to regulate the strokes in certain types of steam-engine.

CATARGIU (or CATARGI), **LASCAR** (1823–1899), Rumanian statesman, belonged to an ancient Walachian family, one of whose members had been banished in the 17th century by Prince Matthew Bassaraba and had settled in Moldavia. Under Prince Gregory Ghica (1849–56) Catargiu rose to be prefect of police at Jassy. In 1857 he became a member of the *Divan ad hoc* of Moldavia, a commission elected in accordance with the treaty of Paris (1856) to vote on the proposed union of Moldavia and Walachia. His strongly conservative views, especially on agrarian reform, induced the Conservatives to support him as a candidate for the throne in 1859. During the reign of Prince Cuza (1859–66) Catargiu was one of the Opposition leaders. On the accession of Prince Charles in May 1866 Lascar Catargiu became president of the council (prime minister); but finding himself unable to co-operate with his Liberal colleagues, I. C. Bratianu and C. A. Rosetti, he resigned in July. After eight more ministerial changes, culminating in the anti-dynastic agitation of 1870–71, Catargiu formed, for the first time in Rumanian history, a stable Conservative cabinet, which lasted until 1876. Impeachment of himself and his cabinet was threatened, but the proposal was withdrawn in 1878, and he remained in opposition until 1889, when he formed a short-lived cabinet, taking the portfolio of the Interior. In the Florescu ministry of March 1891 he occupied the same position, and in Dec. he again became president of the council, retaining office until 1895. He died at Bucharest on April 11, 1899.

CATARRH, a term chiefly signifying mild inflammation of the mucous membrane of the respiratory passages, in popular language a "cold." It is the result of infection by a micro-organism esp. *M. catarrhalis*, and begins with sneezing and profuse watery discharge from the nostrils and eyes while smell and taste are impaired. There is usually sore throat and bronchial irritation, causing hoarseness and cough. Sometimes temporary loss of voice results. There is always more or less feverishness and discomfort, and frequently an extreme sensitiveness to cold.

After a few days the symptoms begin to abate, the discharge from the nostrils and chest becoming thick and yellow. Where natural resistance is low bronchitis or broncho-pneumonia may ensue.

Treatment. A hot bath with a dose of sp. etheris nitr., Dover's powder or aspirin at night is sometimes useful. Preventive treatment is by vaccine therapy (*q.v.*). Locally a snuff made of menthol 1 part, ammonium chloride 3 parts and boracic acid 2 parts will relieve the discomfort of the nose.

The term catarrh is used in a wider sense to describe a similar pathological condition of any mucous surface in the body, *e.g.* gastric catarrh, intestinal catarrh, etc.

See also RESPIRATORY SYSTEM, and ALIMENTARY SYSTEM.

CATARRHINE APE, the term used (in contradistinction to Platyrrhine, *q.v.*) to describe those apes which have the nostrils approximated; the aperture pointing downward; and the intervening septum narrow. These are the distinguishing features of all the Old World primates. (See PRIMATES.)

CATASTROPHE. In ancient Greek drama the change in the plot which leads up to the conclusion (Gr. *καταστροφή*, to overturn). Hence any sudden change, particularly of a disastrous nature, and in geology a great convulsion of the earth's surface.

CATAUXI, a numerous cannibal tribe of South American Indians of the Purús river district, Brazil. They cultivate manioc and make pottery and bark canoes.

CATAWBA, the principal tribe of the eastern division of the Siouan stock of American Indians; habitat, South Carolina. They were friendly to British and Americans, long at war with the Iroquois. The population in the 17th century was about 5,000; in 1780 about 500; 1907, 60.

CATAWBA, an amber coloured, richly flavoured wine made from the light-red grape of the same name. The grape is a variety of the *Vitis labrusca*, a North American and Asiatic species, and takes its name from the Catawba river in North and South Carolina. In 1807 the grape was grown in Washington, D.C., but it was not until about 1823 that the name Catawba was given to it. It spread rapidly in New York, Ohio and Ontario, and in 1928 was extensively grown in the Finger lake section of New York. The vine is extremely prolific, the fruit being large and very sweet. The grapes are readily preserved, and their great use is partly accounted for by that fact. The wine has a muscatine flavour.

CATBALOGAN, a municipality (with administration centre and 15 *barrios* or districts) and capital of the province and island of Samar, Philippine Islands. Pop. (1918) 13,544, of whom only 10 were whites. It lies midway between the ports of Manila and Zamboanga and is one of the most important commercial centres of the eastern Bisayan islands. The climate is cool and healthful. Abacá is the most important agricultural product, and the weaving of fibres from abacá and silk forms an important industry. Mats are woven also from the sedge *tiking*. The fisheries are important. In 1918, it had 9 manufacturing establishments with output valued at 93,100 pesos and 164 household industry establishments, output, 45,200 pesos. Its six schools were all public. The main language spoken is a dialect of Bisayan.

CATBIRD (*Damotella carolinensis*), a North American bird of the family Troglodytidae, about 9 in. long, a summer visitor from the Gulf of Mexico, north to New Brunswick and Hudson Bay. Its plumage is slate-gray, with a black cap and tail and chestnut under tail-coverts. It is noted for its beautiful song, with much of the charm of its close relative, the mocking bird. The name expresses the mewing protest of the bird when angry. The catbird winters in the southern States, in Cuba, and from Mexico to Panama. It is resident in Bermuda.

CATBOAT, a small sailing-boat of the pleasure variety, having the mast stepped forward and carrying a single fore-and-aft mainsail set on a boom and gaff, known as a *cat rig*. These boats are also known as Una boats, and frequently carry a centre-board (*q.v.*).

CATCH, a form of concerted vocal music virtually indistinguishable from the round, save for the fact that it is always

humorous in character. The catch had its greatest vogue in earlier centuries, when also the words to which it was sung were too often more jocose than refined. Particulars of various collections available occupy a column of small print in *Grove*. Of the innumerable catch and glee clubs which existed in England in former days one, known simply as the Catch Club, founded as long ago as 1761, still exists. (See also under CANON, CONTRA-PUNTAL FORMS, GLEE and ROUND.)

CATCH-CROPS. The natural successor to the wasteful fallow of the more primitive farmer is the catch-crop of to-day. Its only alternative, if the ground is to be continuously used, is the system of continuous cropping; and though here and there this has been tried with some success, even with wheat, it is never likely to become a common practice. Now every vegetable or market garden represents a method of catch-cropping wholly substituted for any slowly maturing crop. On the farm the system is less intensive and most of the catch-crops are sown in late summer or in autumn in immediate succession to the main crop. The earliest are meant to provide green food for stock in the winter of the same year, the later in the spring of the next year; and some, including turnips, which sprout a second time, may do both. As a rule, though not always, they follow a corn crop; and are therefore in Britain much more freely grown in the south than in the north, where the corn is often carried too late to give time for the operation, or a good enough prospect of success for the crop. As a matter of habit not wholly due to climate, definite rotations of standard crops are more strictly followed by northern farmers than by southern. Indeed some of the thin, warm, early soils in the south are treated rather like gardens with catch-crops following one another on no definite system. In sheep districts white turnips are often immediately followed by rape, the first supplying winter, and the second summer fodder.

The commonest catch-crops are rye, tares or other vetches, winter barley, winter oats and red clover or trifolium. None requires deep cultivation; and the trifolium which needs a firm seed bed is usually sown broadcast on the unploughed stubble, which is thereafter thoroughly harrowed. Annual rye grass, vetches and rape, are not infrequently sown in spring, maize and buck-wheat in early summer; and in sheep districts, mustard is sometimes sown three times successively between March and September. The primary objects of catch-cropping are to provide food for stock in the leaner seasons and to keep the ground in continuous use, substituting "bastard" fallows for the old "bare" or winter or summer fallows. But the system is much involved with the art of preventing the loss of nitrogen in certain soils in certain climates. Much scientific work on the question is still in progress.

CATCHMENT AREAS. The term "catchment area" is used to describe the collecting area from which water would flow to a stream or river, the boundary of the area being determined by the ridge separating water flowing in opposite directions. The amount of water collected within the catchment area would depend on the extent of that area, the amount of rain which has fallen on the surface, and the proportion of that rainfall which has been lost by evaporation or absorption.

The term "run-off" has been adopted to describe that portion of the rainfall which ultimately finds its way to the stream, and the ratio between the rainfall and the "run-off" varies widely, according to the climatic conditions.

In England and Scotland the average annual rainfall varies from a little over 20in. to 175in., and the annual loss by evaporation from a land surface varies from about 10 to 18in., being less in the north, increasing towards the south.

Evaporation.—The loss by evaporation depends on the hours of sunshine, the temperature, and the humidity of the atmosphere, and varies greatly during the different periods of the year as might naturally be expected.

The following average figures for the period 1883-1900, illustrate the effect of these various factors on the proportion of the rainfall which flowed over Teddington weir from the Thames catchment area above that point.

| | Average hours of sunshine. | Average tempera- ture. | Average humidity. | Proportion of rainfall flowing over Teddington weir. |
|--------------|----------------------------------|------------------------------|----------------------|---|
| | | Degrees. | Degrees. | Per cent. |
| Jan.-March . | 57.5 | 39.6 | 84.5 | 60.9 |
| April-June . | 163.2 | 53 | 74.3 | 30 |
| July-Sept. . | 159.8 | 60.2 | 75.7 | 12 |
| Oct.-Dec. . | 46.1 | 41 | 86.5 | 28 |

The total annual loss by evaporation in Britain is less in regions of high rainfall than in areas of low rainfall, and the seasonal loss varies in a similar manner. The influence of climatic conditions on the evaporation is so marked, that in tropical countries the proportion of the rain which flows off the ground is small.

It has been held that forests tend to increase the discharge of a river by reducing evaporation, but such evidence as has been obtainable fails to support this view. Shade cast by the trees would reduce evaporation, but rain which would otherwise flow from the ground, is absorbed by the trees. Although forests have but little effect on the annual loss by evaporation, their presence has an influence in delaying the flow of water from the hillsides, and when a catchment area has been cleared of timber, floods tend to become more intense.

Evaporation from a water surface is greater than from a land surface, especially in tropical countries, and is a matter of importance when lakes occupy a considerable proportion of the catchment area.

Absorption.—The amount of rain falling on the surface which percolates downwards depends on the porosity of the surface soil and the nature of the underlying rock, whether impermeable, porous, or fissured.

When the surface is impermeable, there would be no loss by percolation.

When the surface is permeable but is underlain by impermeable rock, water percolates downwards till that rock is reached and then travels underground in the direction of the steepest inclination of the rock surface, which is generally towards the stream, water lost by percolation reappearing as springs. Such percolation has little influence on the annual run-off, but may have a marked effect on its variations throughout the year. Thick beds of permeable material, such as sand or gravel, absorb large volumes of water, acting as natural storage reservoirs. During periods of abundant rainfall the beds would become saturated, and during periods of dry weather water so absorbed would be gradually discharged, thus maintaining a considerable flow in the stream.

This point is of great importance when it is desired to utilize the water of a stream without constructing a storage reservoir to balance its fluctuations, as the quantity of water which could be taken during certain periods would be limited to the dry weather flow.

When the surface is permeable and is underlain with permeable or fissured rock, such as chalk, the entire rainfall on the catchment area might percolate downwards, reappearing in the form of springs issuing either within or without the limits of the catchment area.

In the former case there would be no surface flow above the point where the springs break out, and in the latter, the whole catchment area would be void of streams. (W. J. E. B.)

CATECHISM, a compendium of instruction (particularly of religious instruction) arranged in the form of questions and answers. The custom of catechizing was followed in the schools of Judaism and in the Early Church, where it helped to preserve the Gospel narrative. (See CATECHUMEN.)

The catechism as we know it is intended primarily for children and uneducated persons. Its aim is to instruct, and it differs from a creed or confession in not being in the first instance an act of worship or a public profession of belief. The first regular catechisms seem to have grown out of the usual oral teaching of catechumens, and to have been compiled in the 8th and 9th cen-

turies. But it is not till the first stirrings of revolt against the hierarchy which preceded the Reformation that they became at all widespread or numerous. The Waldenses of Savoy and France, the Brothers of the Common Life in Germany, and the *Unitas Fratrum* of Bohemia, all used the same catechism (first printed in 1498) for the instruction of their children. It was based on St. Augustine's *Enchiridion* and considers (a) Faith, i.e., the Creed; (b) Hope, i.e., the Lord's Prayer; and (c) Love, i.e., the Decalogue.

The age of the Reformation and the invention of printing gave a great stimulus to the production of catechisms. The adherents of the "old" and the "new" religions alike had to justify their views to the unlearned as well as to the learned, and to give in simple formulas their reasons for the faith that was in them. Moreover, in the universal revolt against authority Christianity itself was in danger of perishing, not only as the result of the cultured paganism of the Renaissance, but also through the brutish ignorance of the common folk, deprived now of their traditional religious restraints. To this peril the reformers were fully alive, and they sought its remedy in education.

In 1520 Luther had brought out a primer of religion dealing briefly with the Decalogue, the Creed and the Lord's Prayer; and other leaders had done something of the same kind. In 1529 all these efforts were superseded by Luther's Smaller Catechism meant for the people themselves and especially for children, and by his Larger Catechism intended for clergy and schoolmasters. These works did much to mould the character of the German people and powerfully influenced other compilations.

In 1537 John Calvin at Geneva published his catechism for children. It was called *Instruction and Confession of Faith for the use of the Church of Geneva* and explained the Decalogue, the Apostles' Creed, the Lord's Prayer and the Sacraments. It was the work of a man who knew little of the child mind, and, though it served as an admirable and transparent epitome of his famous *Institutes*, it was too long and too minute for the instruction of children. Calvin came to see this, and in 1542 drafted a new one which was much more suitable for teaching purposes. This was used in Geneva and in Scotland. The Reformed churches of the Palatinate, on the other hand, used the Heidelberg Catechism (1562-63), mainly the work of two of Calvin's disciples, Kaspar Olevianus and Zacharias Ursinus. This work is perhaps the most widely accepted symbol of the Calvinistic faith, and is noteworthy for its emphasis on the less controversial aspects of the Genevan theology. As revised by the synod of Dort in 1619, it became the standard of most of the Reformed churches of central Europe, and in time of the Dutch and German Reformed churches of America.

Since 1648 the standard Presbyterian catechisms have been those compiled by the Westminster Assembly, presented to parliament in 1647, and then authorized by the General Assembly of the Church of Scotland (July 1648) and by the Scottish parliament (Jan. 1649). The Larger Catechism is "for such as have made some proficiency in the knowledge of the Christian religion," but is too detailed and minute for memorizing, and has never received anything like the reception accorded to the Shorter Catechism, which is "for such as are of weaker capacity." The work was done by a committee presided over first by Herbert Palmer, master of Queens', Cambridge, and then by Anthony Tuckney, master of Emmanuel. The Shorter Catechism, after a brief introduction on the end, rule and essence of religion, is divided into two parts: I. The doctrines we are to believe (1) concerning the nature of God, (2) concerning the decrees of God and their execution. II. The duties we are to perform (1) in regard to the moral law, (2) in regard to the gospel—(a) inward duties, i.e., faith and repentance, (b) outward duties as to the Word, the sacraments and prayer. It has 107 questions and answers, while that of the Anglican Church has but 24, grouping as it does the ten commandments and also the petitions of the Lord's Prayer, instead of dealing with them singly.

There was no universal catechism published by the Latin Church before the council of Trent, but several provincial coun-

cils, e.g., in Germany and Scotland, moved in self-defence along the lines already adopted by the reformers. The council of Trent in 1563 resolved on an authoritative work which was finally carried through by two small papal commissions, and issued in 1566 by Pius V. (Eng. trans. by Donovan, Dublin, 1829). Being uncatechetical in form and addressed to the clergy rather than to the people, it missed its intention, and was superseded by others, especially by those of the Jesuit Peter Canisius, whose *Summa Doctrinae et Institutionis Christianae* (1554) and its shorter form (1556) were already in the field. The catechisms of Bellarmine (1603) and Bossuet (1687) had considerable vogue, and a summary of the former known as *Schema de Parvo* was sanctioned by the Vatican council of 1870. But the Roman Catholic Church as a whole has never had any one official catechism, each bishop being allowed to settle the matter for his own diocese. In England the Roman Catholic Bishops have agreed on the use of what is known as "The Penny Catechism," which is very lucid and well constructed.

Peter Mogilas, metropolitan of Kiev, drew up in 1643, the *Orthodox Confession of the Catholic and Apostolic Eastern Church*. This bulwark against the encroachments of the Jesuits and the Reformed Church was standardized by the synod of Jerusalem in 1672. A smaller catechism was drawn up by order of Peter the Great in 1723. The catechisms of Levshin Platon (1762) and V. D. Philaret (1839), each in his day metropolitan of Moscow, are bulky compilations which cannot be memorized, though there is a short introductory catechism, prefaced to Philaret's volume (Eng. trans. in Blackmore's *Doctrine of the Russian Church*, 1845).

The catechism of the Church of England is included in the Book of Common Prayer. It has two parts: (i.) the baptismal covenant, the Creed, the Decalogue and the Lord's Prayer drawn up probably by Cranmer and Ridley in the time of Edward VI., and variously modified between then (1549) and 1661; (ii.) the meaning of the two sacraments, written on the suggestion of James I. at the Hampton Court Conference in 1604 by John Overall, then dean of St. Paul's. This supplement to what had become known as the Shorter Catechism established its use as against the longer one, *King Edward VIth's Catechism* which had been drawn up in 1553 by John Ponet, bishop of Winchester, and enlarged in 1570 by Alexander Nowell, Overall's predecessor as dean of St. Paul's. By the rubric of the Prayer Book and by the 59th canon of 1603, the clergy are enjoined to teach the catechism in church on Sundays and holidays after the second lesson at Evening Prayer. This custom, long fallen into disuse, has largely been revived during recent years, the children going to church for a special afternoon service of which catechizing is the chief feature. Compared with the thoroughness of most other catechisms this one seems scanty, but it has a better chance of being memorized, and its very simplicity has given it a firm hold on the inner life and conscience of devout members of the Anglican communion throughout the world.

Almost every Christian denomination has its catechism or catechisms. Besides those already enumerated there are two interesting joint productions. In 1898 the National Council of the Evangelical Free Churches in England and Wales published an *Evangelical Free Church Catechism*, representing directly or indirectly the beliefs of 60 or 70 millions of avowed Christians in all parts of the world, a striking example of inter-denominational unity. The *School Catechism* was issued in 1907 by a conference of members of the Reformed churches in Scotland, which met on the invitation of the Church of Scotland. In its compilation representatives of the Episcopal Church in Scotland co-operated, and the book, though "not designed to supersede the distinctive catechisms officially recognized by the several churches for the instruction of their own children," certainly "commends itself as suitable for use in schools where children of various churches are taught together."

Catechisms have a strong family likeness. In the main they are expositions of the Creed, the Lord's Prayer and the Decalogue, and thus follow a tradition that has come down from the 4th century, when Cyril of Jerusalem delivered his catechetical

lectures. The Heidelberg and Westminster Catechisms are of a more logical and independent character. The former is based on the Epistle to the Romans, and deals with the religious life as (1) Repentance, (2) Faith, (3) Love. Under these heads it discusses respectively the sin and misery of men, the redemption wrought by Christ (here are included the Creed and the Sacraments) and the grateful service of the new life (the Decalogue).

See the *Encyclopaedia of Religion and Ethics*, s.v. (A. J. G.)

CATECHOL, PYROCATECHIN or PYROCATECHOL, ortho-dihydroxybenzene, crystallizes in white rhombic prisms, which melt at 104° and boil at 245° ; it is readily soluble in water, alcohol and ether. Catechol, $C_6H_4(OH)_2$, was first prepared in 1839 by H. Reinsch in distilling catechin (the juice of *Mimosa catechu*); it occurs free in kino and in beechwood tar; its sulphonic acid is present in the urine of man and the horse. It is formed in the alkaline fusion of many resins, and may be prepared by fusing ortho-phenolsulphonic acid, *o*-chlorophenol, *o*-bromophenol and phenoldisulphonic acid with potash, by acid hydrolysis of *o*-phenylenediamine (see AMINES), or, better, by heating its methyl ether, guaiacol, $C_6H_4(OH)(OCH_3)$, a constituent of beechwood tar, with hydriodic acid.

Ferric chloride gives a green coloration with aqueous catechol, while its alkaline solution rapidly changes to a green and finally to a black colour on exposure to the air. It reduces ammoniacal silver solutions in the cold with formation of a silver mirror and alkaline cupric salts to cuprous oxide on heating.

Guaiacol may be obtained directly from beechwood tar, from catechol by methylation with potash and potassium methyl sulphate at 180° , or from anisole by nitration and subsequent reduction to amino-anisole, which is then diazotized and boiled with water. It melts at 28° and boils at 250° . It is employed in medicine as an expectorant. The dimethyl ether or veratrol is also used in medicine. Many other catechol derivatives have been suggested for therapeutic application. Guaiacol carbonate is known as duotal, the phosphate as phosphatol, the phosphite as guaiaco-phosphal; phosphatol is a mixture of the phosphites of creosote phenols. The valerianic ester of guaiacol is known as geosote, the benzoic as benzosol, the salicylic as guaiacolsalol, while the glycerin ether appears as guaiamar.

Catechol is the starting-point in the synthesis of the active principle of the suprarenal capsules which is variously known as adrenaline, epinephrine and suprenaline. The successive stages in this synthesis are catechol, chloroacetocatechol, methylaminoacetocatechol (adrenalone) and inactive adrenaline, which is resolved into physiologically active *l*-adrenaline through the bitartrate.

CATECHU or CUTCH, an extract obtained from several plants (the derivation is from the Malay *Kachu*), its chief sources being the wood of two species of acacia (*A. catechu* and *A. suma*), both natives of India. This extract is known as black catechu. A similar extract, known in pharmacy as pale catechu (*Catechu pallidum*), and in general commerce as gambir, or *terra japonica*, is produced from the leaves of *Uncaria gambir* and *U. acida*, cinchonaceous plants growing in the East Indian Archipelago. A third product to which the name catechu is also applied, is obtained from the fruits of the areca or betel palm, *Areca catechu*.

Ordinary black catechu is usually imported in three different forms. The first and best quality, known as Pegu catechu, is obtained in blocks externally covered with large leaves; the second and less pure variety is in masses, which have been moulded in sand; and the third consists of large cubes packed in coarse bags. The wood of the two species of *Acacia* yielding catechu is taken for the manufacture when the trees have attained a diameter of about 1 ft. The bark is stripped off and used for tanning, and the trunk is split up into small fragments, which are covered with water and boiled. When the extract has become sufficiently thick it is cast into the forms in which the catechu is found in commerce.

Catechu so prepared is a dark brown, or, in mass, almost black, substance, brittle, and having generally a shining lustre. It is astringent, with a sweetish taste. In cold water it disintegrates, and in boiling water, alcohol, acetic acid and strong caustic alkali it is completely dissolved. Chemically it consists of a mixture of

a peculiar variety of tannin termed catechu-tannic acid with catechin or catechuic acid, and a brown substance due to the alteration of both these principles. Catechu-tannic acid is an amorphous body soluble in cold water, while catechin occurs in minute, white, silky, needle-shaped crystals, which do not dissolve in cold water. A very minute proportion of quercetin, a principle yielded by quercitron bark, has been obtained from catechu.

Gambir.—Gambir, which is similar in chemical composition to ordinary catechu, occurs in commerce in the form of cubes of about an inch in size, with a pale brown or yellow colour, and an even earthy fracture. For the preparation of this extract the plants above mentioned are stripped of their leaves and young twigs, and these are boiled down in shallow pans. The juice is strained off, evaporated, and when sufficiently concentrated is cast into shallow boxes, where, as it hardens and dries, it is cut into small cubes.

Gambir and catechu are extensively employed in dyeing and tanning. For dyeing they have been in use in India from the most remote period, but it was only during the 19th century that they were placed on the list of European dyeing substances. Catechu is fixed by oxidation of the colouring principle, catechin, on the cloth after dyeing or printing; and treated thus it yields a variety of durable tints of drabs, browns and olives with different mordants (see DYEING). The principal consumption of catechu occurs in the preparation of fibrous substances exposed to water, such as fishing-lines and nets, and for colouring stout canvas used for covering boxes and portmanteaus under the name of tanned canvas. Black catechu is official in most pharmacopoeias except that of Great Britain, in which pale catechu is the official drug. The actions and uses of the two are similar, but black catechu is the more powerful. The dose is from five to twenty grains. The *pulvis catechu compositus* contains catechu and kino, and may be given in doses twice as large as those named. The drug has the actions and uses of tannic acid, but owing to the relative insolubility of catechu-tannic acid, it is more valuable than ordinary tannic acid in diarrhoea, dysentery and intestinal haemorrhage.

CATECHUMEN, a technical term applied to a person receiving instruction in the Christian religion with a view to baptism (Gr. *κατηχούμενος*, one receiving instruction, from *κατηχέω*, to teach orally). The catechumenate grew naturally out of Judaism, which as a missionary religion had to instruct recruits. These were admitted by circumcision and baptism, women by baptism only. Second-century practice in Palestine is described in *Yebamot* 47 a.b. "They acquaint him with some of the lighter and some of the weightier commandments. . . . As they show him the penalty of breaking commandments, so they show him the reward of keeping them. . . . If he accepts, they circumcise him forthwith . . . when he is healed they at once baptize him." The ordeal was clearly much lighter for women. For this and other reasons there was a considerable body of potential proselytes on the fringe of Judaism. They were known as "God-fearers"; if they shrank from circumcision themselves they generally had the rite performed on their sons (G. F. Moore, *Judaism*, i. 323 ff.).

The Apostles are said to have instructed converts after baptism (Acts ii. 41, 42); the earliest teaching was presumably an explanation of the Messianic prophecies in the Old Testament. On the Gentile mission Paul's strongest appeal was made to "The God-fearers," who had been already won for monotheism and Jewish standards of morality, and for whom circumcision was no longer necessary. The word *κατηχέω* applied to Christian instruction, presumably both before and after baptism, occurs in the New Testament in Luke i. 4 (of Theophilus), Acts xviii. 25 (of Apollos—the exact meaning is disputed; see APOLLOS) and Gal. vi. 6 ("let him that is taught communicate with him that teacheth in all good things").

As the Gentile element in the Church preponderated, instruction became more definite. It was probably undertaken by the "teachers" (1 Cor. xii. 28). *The Teaching of the Twelve Apostles*, i.-vi. is a manual of ethical teaching. The *Shepherd of Hermas* was widely used (Eus. *H. E.* III. iii. 6.). Justin Martyr (*Apol.* i. 61) says converts are taught to pray for forgiveness before baptism.

In the 4th century, with the rise of heresy, detailed doctrinal teaching was given. Of those treatises which have survived, the most important are Cyril of Jerusalem's *Catechetical Lectures*, Gregory of Nyssa's *Catechetical Oration*, and Augustine's *de Rudibus Catechizandis*. By this time the postponement of baptism had become general; thus Constantine was not baptized till he was at the point of death. Accordingly a large proportion of Christians belonged to the catechumenate. Most of them were merely "adherents" of the Church; others were under definite instruction for baptism. The preparation, preceded probably by a period of probation, generally coincided with the 40 days of Lent, the baptism taking place on Easter Eve. The preparation consisted of (a) instruction in what must be renounced, (b) instruction in the faith, (c) exorcisms of evil spirits (*see* BAPTISM). All catechumens attended the first part of the Eucharistic Service, known in the West as *Missa Catechumenorum*, after which they were "dismissed." As infant baptism became general, the catechumenate decayed. The baptismal rites now used are clearly adaptations of rites intended for the reception of adult catechumens. In the mission field the catechumenate has been revived and primitive conditions are repeated. Thus a polygamist will often be a life-long "adherent" debarred from baptism by marriage difficulties of his own making. (W. K. L. C.)

CATEGORICAL means generally unconditional, not subject to any conditions or reservations. 1. *In Logic*—The term categorical is used to describe those judgments or propositions which are neither hypothetical nor disjunctive. These latter are the two types of conditional propositions (*see* CONDITION); categorical propositions are those which make absolute or unconditional assertions, like *S is P* or *S is not P*. But the distinction between categorical and conditional propositions is relative to the extent that it is frequently possible to express a proposition of the one type as a proposition of the other type without much violence to their meaning, e.g., the categorical assertion: *Equilateral triangles are equiangular*, can also be expressed in the conditional form: *If a triangle is equilateral it is equiangular* (hypothetical), or *either a triangle is equiangular or it is not equilateral* (disjunctive). 2. *In Ethics* Kant introduced the term "categorical imperative" for a moral law that is unconditional or absolute, or whose validity or claim does not depend on any ulterior motive or end. According to Kant there is only one such categorical imperative, which he formulates variously. One formula is: "Act only on such a maxim as you can will that it should become a universal law." This is purely formal, and expresses the condition of the rationality of conduct, rather than the condition of its morality. Another formula given by Kant is: "So act as to treat humanity, whether in your own person or in another, always as an end, and never as only a means." (*See* KANT, and ETHICS, HISTORY OF.)

CATEGORICAL IMPERATIVE: *see* CATEGORICAL.

CATEGORY means a predicate. Now the predicate of an assertion is usually some class-name or concept under which the subject is brought, in the case of affirmative assertions, or from which the subject is excluded, in the case of negative assertions. In popular usage, accordingly, the term category is applied to any class or concept. Philosophically, however, the term category is confined to *ultimate* modes of being, or to the ultimate concepts or modes of apprehension by which reality is known. The first systematic account of categories was given by Aristotle. His account held the field for many centuries. Its most serious competitor in the history of philosophy is the account given by Kant. But although the general orientation of the two philosophers was very different, yet their lists of categories are remarkably similar when due allowance is made for their difference in philosophical standpoint.

Aristotle's Account of the Categories.—This is contained partly in the treatise of that name which forms the first of the collection of logical treatises known as the *Organon*, and partly in the *Metaphysics*. Aristotle assumed that our ultimate modes of apprehending reality correspond to ultimate modes of being. Like most pre-Kantian philosophers who were not sceptics Aristotle did not seriously consider the possibility that reality may

not be in itself what it is perceived or conceived to be. The Aristotelian categories were accordingly regarded by him as expressing at once ultimate modes of being and ultimate modes of apprehension (or predication). His list of categories was as follows (the Latin and English equivalents are added for convenience).

| | | | | | |
|-------------------------|----------------------------|------------------------------|----------------------------|----------------------------|---|
| οὐσία ποσόν | substantia quantitas | substance quantity | ποτέ κεῖσθαι | quando situs | time position (or situation) |
| ποιόν πρός τι πού | qualitas relatio ubi | quality relation place | ἔχειν ποιεῖν πάσχειν | habitus actio passio | state (or condition) activity passivity (or being acted on) |

How exactly Aristotle arrived at his scheme of ten categories is not known. It has been suggested that he was guided by familiar grammatical distinctions—nouns, adjectives of quantity and of quality, adverbs of place and of time, the active and the passive voice of verbs, and so on. But there is no real evidence of this contention. A certain degree of correspondence between categories and grammatical distinctions would be inevitable in any case, seeing that distinctions in thought naturally find expression in linguistic differences.

In order to understand the Aristotelian list of categories one must be clear about the meaning of "ultimate modes of being" which they were intended to express. J. S. Mill was under the impression that the list was intended to be a table of classification of all nameable things, and consequently criticized it as at once defective in some respects and redundant in others. But that was a misconception. To be a "thing" is only one "mode of being," namely, that of "substance," in the Aristotelian list. But the same concrete reality can embody many or all modes of being. Of Aristotle, for instance, one can predicate that he was a man (substance) who lived in Athens (place) in the 4th century B.C. (time), taught philosophy (activity), was accused of atheism (passivity), felt depressed (state), fled to friends (relation), and so on. A classification of "things" would be bad if it included the same object (say, Aristotle) in several classes at once. But it is quite different with "modes of being." Several or all ultimate modes of being may, and do, exist in the same concrete individual, and yet such mode of being may be quite distinct from, and irreducible to, any other. To be a "thing" is different from being a "quantity" or "quality," etc., and none of them can be made intelligible by reference to the other. The predicate "green" may be explained by reference to "colour," and "colour" may be explained by reference to "quality"; but "quality" itself cannot be usefully explained by reference to any other term, but is ultimate in this sense. Similarly with the other categories—they were all intended to express ultimate modes (or *summa genera*) of being, and therefore of predication.

Aristotle himself did not regard his ten categories as of equal importance. It is clear that he regarded substance as, in a sense, the most fundamental category, inasmuch as quantity, quality, etc., can only exist in substances. Hence the Scholastic, Cartesian and Spinozistic distinction between *Substance* and *Accidens* (or *Mode*), between that which exists by itself and that which only exists in another. Curiously enough recent thought has tended more and more to discard the category of substance altogether (*see* SUBSTANCE) in favour of a world of "events" in space-time. There is also a tendency to discard the categories of activity and passivity or at least to reduce them to that of quantity (*see* CAUSALITY).

Kant's Account of the Categories.—This is most intimately connected with his "critical" standpoint, and constitutes the very core of his philosophy. Kant dismisses the idea that we can have knowledge of things as they are in themselves (*noûmena*), and he confines human knowledge to phenomena, that is, to *appearances* of the real rather than to the inner *being* of it. This standpoint involves jettisoning of one side of the doctrine of the categories as taught by Aristotle, namely, the claim that they represent ultimate modes of *being*. From Kant's point of view the enquiry must confine itself to ultimate modes of human apprehension or forms of synthesis. Now Kant held that in all so-called human knowledge certain raw materials are supplied from outside, but that they are worked up, as it were, by certain forms of

apprehension which are inherent in the human mind (*see* A PRIORI), and he distinguished two groups of such forms of synthesis. In one group he placed space and time, which he regarded as forms of synthesis involved already in the very possibility of apprehending things at all in sense-perception. They are forms of *sense-apprehension* or perception (as distinguished from forms of *thought*). In the other group he placed the categories or forms of thought. This restriction of the term category to a mode of *thought* as distinguished from any other mode of apprehension is peculiar to Kant. Aristotle made no such distinction, and using the term category in the Aristotelian sense, it may be said that Kant recognized the Aristotelian categories of space and time, at least as modes of predication. In Kant's special sense, however, the categories are forms of conceptual or intellectual synthesis. Now judgment is the same as thought or understanding. The ultimately different forms of judgment should consequently express the ultimately different kinds of synthesis of the understanding. Kant accordingly derived his list of categories from the different forms of judgment. But instead of critically determining first what the ultimate forms of judgment are he took over from formal logic the usually recognized list with just a little further elaboration or over-elaboration. His result is represented in the following table which gives the Kantian categories together with the various forms of judgment to which they severally correspond. It will be observed that they are grouped into four principal classes with three divisions in each.

| <i>Form of Judgment</i> | <i>Corresponding Category</i> |
|--|-----------------------------------|
| I. Quantity. | I. Quantity. |
| (a) Singular (<i>This S is P</i>) | (a) Unity |
| (b) Particular (<i>Some S's are P</i>) | (b) Plurality |
| (c) Universal (<i>All S's are P</i>) | (c) Totality |
| II. Quality | II. Quality |
| (a) Affirmative (<i>S is P</i>) | (a) Reality |
| (b) Negative (<i>S is not P</i>) | (b) Negation |
| (c) Infinite (<i>S is not P</i>) | (c) Limitation |
| III. Relation | III. Relation |
| (a) Categorical (<i>S is P</i>) | (a) Substantiality |
| (b) Hypothetical (<i>If A, then C</i>) | (b) Causality |
| (c) Disjunctive (<i>Either A or B</i>) | (c) Reciprocity |
| IV. Modality | IV. Modality |
| (a) Problematic (<i>S may be P</i>) | (a) Possibility and Impossibility |
| (b) Assertive (<i>S is P</i>) | (b) Existence and Non-existence |
| (c) Apodictic (<i>S must be P</i>) | (c) Necessity and Contingency. |

It will be noticed that Kant's table of categories includes a number of the Aristotelian categories, and to these must be added space and time, which Kant did not call categories, but which he practically recognized as categories in Aristotle's sense of the term, at least on the epistemological side if not on the ontological side. But there are also obvious differences between the two schemes. The most remarkable of these is the entire absence from the Aristotelian scheme of anything corresponding to Kant's categories of modality. This difference is significant because it shows most clearly the difference in their ways of approaching the problem. Kant, as already indicated, was mainly or exclusively interested in thought, and possibility, actuality, and necessity certainly express real differences in our way of thinking about things. Aristotle, however, regarded the categories primarily as modes of being; and differences of modality do not express any differences in the being of things.

LATER TENDENCIES.—The problem of the categories continued to attract deep interest after the time of Kant, and occupied a very prominent place in the thought of Hegel whose whole philosophy turned on it. English philosophers also devoted a good deal of attention to the problem, especially J. S. Mill. Gradually, however, interest was lost in the categories as a special problem, although it continued to receive some attention from historians of philosophy, and is of course dealt with incidentally in such new systems of philosophy as that of S. Alexander (*Space, Time and Deity*). The fact is that the new movements in geometry and in physics are tending to upset such familiar categories as those of space, time, substance and causality, and the whole subject may be said to be in the melting-pot.

CATENA, VINCENZO DI BIAGIO (c. 1470–1531) Venetian painter, a descendant of an old Venetian family, and not the same person as the artist Vincenzo da Treviso, with whom he was at one time erroneously identified. Catena probably studied in Giovanni Bellini's studio in Venice during the last decades of the 15th century. Ridolfi, the earliest of Catena's biographers, says of him: "The character of Catena's genius as a painter was noble, as his works show. In addition, he was the possessor of great wealth, which enabled him to paint at ease and to gain distinction. He lived at the same time as Giorgione, whose glory he strove to emulate by every means in his power." The Bellinesque phase of his art is represented by the three following pictures, which are all signed: "Virgin and Child," in the Walker gallery at Liverpool; "Virgin and Child with Saints and Donors," in the Mond Collection; "The Holy family with a saint," at Budapest. The "Trinity" in the church of S. Simeone Grande at Venice, and the "Virgin and Child with two Saints" in the Venice Academy (348) may also be ascribed to this early period. The following works may be classified as representing his second or middle period, when Giorgione's influence made itself increasingly felt; "The Doge Leonardo Loredan kneeling before the Virgin" (1510), in the Doge's Palace; the "St. Jerome in his Study," and the "Madonna and Child, with a kneeling warrior," both in the National Gallery. The latter picture was purchased as by Giorgione. "The Adoration of the Infant Christ with Donor and Shepherd boy" of Lord Brownlow's collection; "Christ giving the Keys to St. Peter" in the Gardiner collection at Boston; half figure of Judith in the Querini-Stampalia collection in Venice, and his masterpiece dated 1520, the "Glorification of St. Cristina," in S. Maria Mater Domini at Venice; these all belong to the middle and best period. The "Judith" ascribed to Giorgione in the Hermitage at Leningrad has been ascribed to Catena by two authorities (Hadeln, Richter). A representative work of Catena's last period is the "Holy Family" at Dresden (Woermann 65) which is cool in tone and pale in colour. Catena was a good portraitist; the Berlin museum contains his portrait of Raimund Fugger mentioned by Vasari; at the National Gallery, London, and the Vienna museum are two portraits in the Bellini style. Catena died soon after Sept. 30, 1531, the date of his last will. He left his property to the Painter's guild at Venice, with provision for dowries to daughters of poor painters.

CATENARY: *see* CURVES, SPECIAL.

CATERAN, the band of fighting men of a Highland clan (Gaelic *ceathairine*, a collective word meaning peasantry); hence the term is applied to the Highland, and later to any, marauders or cattle-lifters.

CATERHAM, an urban district of Surrey, England, 20 m. S. of London by the S.R. Pop. (1931) with Warlingham 19,503. It lies in healthy Downs country, and has grown in modern times from a village into a large residential town. There are large barracks in the neighbourhood, and the Metropolitan district lunatic asylum is close to the town.

CATERPILLAR, the popular name given to the larva of butterflies, moths and saw-flies (*see* LEPIDOPTERA; HYMENOPTERA; INSECTS; METAMORPHOSIS).

CATESBY, ROBERT (1573–1605), English conspirator, son of Sir William Catesby of Lapworth, Warwick, prominent recusant, was born in 1573, and entered Gloucester hall (now Worcester college), Oxford, in 1586. In 1596 he was one of those arrested on suspicion during an illness of Queen Elizabeth. In 1601 he took part in the rebellion of Essex, was wounded in the fight and imprisoned, but finally pardoned on the payment of an

enormous fine. In 1602 he despatched Thomas Winter and the Jesuit Tesimond *alias* Greenway to Spain to induce Philip III. to organize an invasion of England, and in 1603, after James's accession, he was named as an accomplice in the "Bye Plot." Exasperated by his personal misfortunes and by the repressive measures under which his co-religionists were suffering, he was now to be the chief instigator of the Gunpowder Plot. The idea seems first to have entered his mind in May, 1603. About the middle of Jan. 1604 he imparted his scheme of blowing up the Parliament House to his cousin Thomas Winter, subsequently taking in Guy Fawkes and several other conspirators. But his determination not to allow warning to be given to the Roman Catholic peers was the actual cause of the failure of the plot. A fatal mistake had been made in imparting the secret to Francis Tresham (*q.v.*), in order to secure his financial assistance; and there is little doubt that he was the author of the celebrated letter to his brother-in-law, Lord Monteagle, which betrayed the conspiracy to the Government on Oct. 26. On receiving the news, Catesby exhibited extraordinary coolness; he refused to abandon the attempt, and his confidence was strengthened by Fawkes's report that nothing in the cellar had been touched or tampered with. After the discovery of the conspiracy Catesby fled with his fellow-plotters, taking refuge ultimately at Holbeche, Staffs., where on the night of Nov. 8 he was overtaken and killed. He had married Catherine, daughter of Thomas Leigh of Stoneleigh, Warwick and left a son, Robert, who inherited that part of the family estate which had been settled on Catesby's mother and was untouched by the attainder. Robert is said to have married a daughter of Thomas Percy. (See also GUNPOWDER PLOT.)

CAT-FISH, the name generally given to the fishes of the sub-order Siluroidea of the order Ostariophysi, in which the air-bladder is connected with the internal ear by a chain of ossicles, probably enabling the fishes to hear well. From the Cyprinoids (characins, carps and electric eels) the Siluroidea are distinguished by having the body naked or armoured with bony plates, never normally scaled, and by a number of osteological characters: the air-bladder generally extends laterally so that on each side it is in contact with the skin above the pectoral fin. The name "cat-fish" has reference to the long barbels or feelers about the mouth, of which one pair supported by the maxillaries is always present; generally there are two pairs below the chin, and frequently another developed from the valves between the nostrils. Nearly all the Siluroidea are fresh water fishes, but two families are secondarily marine, the *Ariidae*, found on the coasts and in estuaries of all tropical countries, and the *Plotosidae* of the Indo-Pacific. The group is a large and varied one, containing probably about 2,000 species belonging to 23 different families; most are omnivorous, feeding on almost any kind of animal or vegetable food, and acting as scavengers. The spines of the dorsal and pectoral fins, which are so generally present, are powerful weapons, capable of inflicting severe and sometimes poisonous wounds.

The cat-fishes of North America belong to the family *Amiuridae*, which is peculiar to that continent except for a species in China, and is known also from fresh-water deposits in Wyoming. The *Amiuridae* are closely related to the *Bagridae* of Africa and Asia, and like them and most Siluroidea have a short dorsal fin, with a spine, followed by an adipose fin on the tail. The anterior rays of the pectoral fins are spinous. The head is rather flat, with the mouth terminal and moderately wide, and the jaws with bands of small teeth; there are eight barbels. There are about 25 species, some of which are small; *Amiurus lacustris* of the Great Lakes attains a weight of more than 150 lb. These fishes scoop out a nest in the mud, and the male parent guards the eggs, and later swims with the brood near the shore.

The European cat-fish (*Silurus glanis*), the "Wels" of the Germans, is said to reach a length of 10 ft. and a weight of 400 lbs. It

has a very long tail, beneath which is the long anal fin. Another species (*Parasilurus aristotelis*) occurs in Greece; the remaining *Siluridae* are Asiatic. In South and Central America are no less than nine families of Siluroidea, all endemic. *Diplomys* of Chile and Argentina, with toothed maxillary, is the most primitive living

BY COURTESY OF THE NEW YORK ZOOLOGICAL SOCIETY

FIG. 2.—CAT-FISH OF THE GREAT LAKES, (*AMIURUS LACUSTRIS*)

Siluroid, but other South American forms are highly specialized. Of the Aspredinidae, *Aspredo batrachus* is remarkable for the way in which the female carries the eggs on the abdomen; these sink into the soft spongy skin and a cup develops round each and then becomes stalked. The *Trichomycteridae* include *Stegophilus* and *Vandellia*, little slender naked fishes that live parasitically in the gill chambers of other fishes, and are said to enter the urethra of persons bathing, and by distending the short spines with which the gill-covers are armed, to cause inflammation or even death.

The *Loricariidae*, with about 300 species, are mostly fishes that are covered by a long armour of five series of bony plates on each side, and have the lips expanded into a sucker by means of which they hold on to stones. They feed mainly on mud and algae and have a very long intestine that is coiled like a watch-spring. In some species there are pronounced sexual differences, the males having broader and blunter heads, margined with spines or bristles, or bearing branched tentacles on the snout. In the mountain streams of the Andes the *Loricariidae* are represented by small forms (*Cyclopium* or *Arges*) known as "prenadillas"; in these regions there are no carnivorous fishes to attack them and they are completely naked, having lost the bony armour that protects the lowland forms. A mining engineer who had diverted a stream in order to empty a pot-hole, observed a number of these fishes climb a precipice from the hole to the stream above it, obtaining alternate holds with the sucker and the rough surface of the pelvic fins; these were moved forward by the contraction of special muscles attached to the pelvic bones, while the sucker was holding. The *Callichthyidae* are another armoured family, but with only two rows of plates on each side of the body. *Callichthys* builds nests of grass, sometimes placed in a hole scooped out of the bank; both parents guard the nest. In the South American *Doradidae*, as in the similar but unrelated *Mochochidae* of Africa, the air-bladder is a sound-producing organ. *Doras* travels from one pond to another in the dry season, sometimes journeying all night. The *Clariidae* of Africa and Asia are also air-breathing fishes,

provided with air-chambers above the gills; in *Clarias* special vascular tree-like organs nearly fill the chamber, but in *Saccobranchus* these are absent and the air-sac extends backwards for half the length of the fish. These are elongate, more or less eel-shaped fishes; in the dry season they burrow in the mud, but some species are said to leave their burrows at night and crawl about on land in search of food.

FROM JORDAN, "FISHES" (D. APPLETON)

FIG. 3.—CAT-FISH OF AFRICA, (*MALOPTERUS ELECTRICUS*)

The African *Amphiliidae* and the *Sisoridae* of India have the lower surface of the head and abdomen flat and the paired fins horizontal, an adaptation to life in mountain torrents; in some genera the lips form a sucker similar to that of the *Loricariidae*. The electric cat-fish (*Malopterus electricus*) is widely distributed in Africa. The skin is soft, and immediately beneath it lies the electric organ, formed of rhomboidal cells of a fine gelatinous substance, and differing from that of other fishes in being part of the tegumentary system, not derived from the muscles. Certain species of *Synodontis*, a genus common in the Nile, are white on the back and blackish beneath, a coloration connected with their habit of swimming belly upwards. The *Ariidae*,

most of which live in salt water, are typical Siluroids in form and structure of the fins, whereas the other marine family, the *Plotosidae*, have a very long tail, with the long anal fin confluent with the caudal. In some species of *Aris* the eggs, few in number and as large as marbles, are carried about by the male in his mouth. *Bucklandium* from the lower Eocene (London clay) is an Ariid.

(C. T. R.)

CATGUT, the name applied to cord of great toughness and tenacity prepared from the intestines of sheep, or occasionally from those of the horse, mule and ass. Those of the cat are not employed, and therefore it is supposed that the word is properly *kitgut*, *kit* meaning "fiddle," and that the present form has arisen through confusion with *kit-cat*. The substance is used for the strings of harps and violins, as well as other stringed musical instruments, for hanging the weights of clocks, for bow-strings, and for suturing wounds in surgery. To prepare it the intestines are cleaned, freed from fat, and steeped for some time in water, after which their external membrane is scraped off with a blunt knife. They are then steeped for some time in an alkaline lye, smoothed and equalized by drawing out, subjected to the antiseptic action of the fumes of burning sulphur, if necessary dyed, sorted into sizes, and twisted together into cords of various numbers of strands according to their uses. The best strings for musical instruments are imported from Italy ("Roman strings"), and it is found that lean and ill-fed animals yield the toughest gut.

CATHA, a shrub (*Catha edulis*, family Celastraceae) native to Arabia and to Africa from Abyssinia to the Cape. It is also cultivated, especially in Arabia, where it is called *khat*, *kat*, or *kasta*. The Arabians make a kind of tea from the dried leaves and young shoots. These are also chewed extensively for their stimulant properties, which somewhat resemble those of coca. See ARABIA: *Flora*; COCA; COCAINE.

CATHARS (CATHARI or CATHARISTS), a widespread heretical sect of the middle ages. This article relates to the Western Cathars, as they appear (1) in the Cathar Ritual written in Provençal and preserved in a 13th-century ms. in Lyons, published by Clédât, Paris, 1888; (2) in Bernard Gui's *Practica inquisitionis haereticæ pravitatis*, edited by Canon C. Douais, Paris, 1886; and (3) in the *procès verbal* of the inquisitors' reports. Some are dualists, and believed that there are two gods or principles, one of good and the other of evil, both eternal; but as a rule they subordinated the evil to the good, and all were universalists in so far as they believed in the ultimate salvation of all men.

Their tenets were as follows:—The evil god, Satan, who inspired the malevolent parts of the Old Testament, is god and lord of this world, of the things that are seen and are temporal, and especially of the outward man which is decaying, of the earthen vessel, of the body of death, of the flesh which takes us captive under the law of sin and desire. This world is the only true purgatory and hell, being the antithesis of the world eternal, of the inward man renewed day by day, of Christ's kingdom which is not of this world. Men are the result of a primal war in heaven, when hosts of angels incited by Satan or Lucifer to revolt were driven out, and were imprisoned in terrestrial bodies created for them by the adversary.

How shall man escape from his prison-house of flesh, and undo the effects of his fall? For mere death brings no liberation, unless a man is become a new creation, a new Adam, as Christ was; unless he has received the gift of the spirit and become a vehicle of the Paraclete. If a man dies unreconciled to God through Christ, he must pass through another cycle of imprisonment in flesh; perhaps in a human, but with equal likelihood in an animal's body. For when after death the powers of the air throng around and persecute, the soul flees into the first lodging of clay that it finds. Christ was a life-giving spirit, and the *boni homines*, the "good men," as the Cathars called themselves, are his ambassadors. They alone have kept the spiritual baptism with fire which Christ instituted, and which has no connection with the water baptism of John; for the latter was an unregenerate soul, who failed to recognize the Christ, a Jew whose mode of baptism with water

belongs to the fleeting outward world and is opposed to the kingdom of God.

The Cathars fell into two classes, corresponding to the Baptized and the Catechumens of the early church, namely, the Perfect, who had been "consoled," i.e., had received the gift of the Paraclete; and the *credentes* or Believers. The Perfect formed the ordained priesthood and controlled the church; they received from the Believers unquestioning obedience, and as vessels of election in whom the Holy Spirit already dwelt, they were adored by the faithful, who were taught to prostrate themselves before them whenever they asked for their prayers. They alone were become adopted sons, and so able to use the Lord's Prayer, which begins, "Our Father, which art in heaven." The Perfect alone knew God and could address him in this prayer, the only one they used in their ceremonies. The mere *credens* could at best invoke the living saint, and ask him to pray for him.

All adherents of the sect seem to have kept three Lents in the year, as also to have fasted Mondays, Wednesdays and Fridays of each week; in these fasts a diet of bread and water was usual. But a *credens* under probation for initiation, which lasted at least one and often several years, fasted always. The life of a Perfect was so hard, and, thanks to the inquisitors, so fraught with danger, that most Believers deferred the rite until the death-bed, as in the early centuries many believers deferred baptism. The rule imposed complete chastity. The passages of the New Testament which seem to connive at the married relation were interpreted by the Cathars as spoken in regard of Christ and the church. The Perfect must also leave his father and mother. The family must be sacrificed to the divine kinship. He that loveth father or mother more than Christ is not worthy of him, nor he that loveth more his son or daughter. The Perfect takes up his cross and follows after Christ. He must abstain from all flesh diet except fish. He may not even eat cheese or eggs or milk, for they, like meat, are produced *per viam generationis seu coitus*. Everything that is sexually begotten is impure. Fish were supposed to be born in the water without sexual connection, and on the basis of this old physiological fallacy the Cathars framed their rule of fasting. And there was yet another reason why the Perfect should not eat animals, for a human soul might be imprisoned in its body. Nor might a Perfect or one in course of probation kill anything, for the Mosaic commandment applies to all life.

The central Cathar rite was *consolamentum*, or baptism with the spirit. The spirit received was the Paraclete, the Comforter, derived from God and sent by Christ, who said, "The Father is greater than I." Of a consubstantial Trinity the Cathars naturally had never heard. Infant baptism they rejected because it was unscriptural and because all baptism with water was an appanage of the Jewish demiurge Jehovah, and as such expressly rejected by Christ. The *consolamentum* removes original sin, undoes the effects of the primal fall, clothes upon us our habitation which is from heaven, restores to us the lost garment of immortality. A Consoled is an angel walking in the flesh, whom the thin screen of death alone separates from Christ and the beatific vision. The rite was appointed by Christ, and has been handed down from generation to generation by the *boni homines*.

In the case of a candidate for initiation the Perfect addresses the postulant by the name of Peter; and explains to him from Scripture the indwelling of the spirit in the Perfect, and his adoption as a son by God. The Lord's Prayer is then repeated by the postulant after the elder, who explains it clause by clause. Then came the Renunciation, primitive enough in form, but the postulant solemnly renounced, not Satan and his works and pomp, but the harlot church of the persecutors; he renounced the cross which its priests had signed on him by baptism and other magical rites. Next followed the spiritual baptism itself, consisting of imposition of hands, and holding the Gospel on the postulant's head. The elder begins a fresh allocution by citing Matt. xxviii. 19, Mark xvi. 15, 16, John iii. 3 (where the Cathars' text must originally have omitted in v. 5 the words "of water and," since their presence contradicts their argument). Acts ix. 17, xviii. viii. 14-17, are then cited; also John xx. 21-23, Matt. xvi. 18, 19, Matt. xviii. 18-20, for the Perfect one receives in this rite power

to bind and loose. The Perfect's vocation is then defined in terms of a strictly literal observance of the Commandments and the Sermon on the Mount. Asked if he will fulfil these demands, the postulant answers: "I have this will and determination. Pray God for me that he give me his strength." The next episode of the rite exactly reproduces the Roman *confiteor* as it stood in the 2nd century; "the postulant says: '*Parcite nobis*. For all the sins I have committed, in word or thought or deed, I come for pardon to God and to the church and to you all.' And the Christians shall say: 'By God and by us and by the church may they be pardoned thee, and we pray God that he pardon you them.'"

There follows the act of "consoling." The elder takes the Gospel off the white cloth, where it has lain all through the ceremony, and places it on the postulant's head, and the other *boni homines* present place their right hands on his head; they shall say the *parcias* (spare), and thrice the "Let us adore the Father and Son and Holy Spirit," and then pray thus: "Holy Father, welcome thy servant in thy justice and send upon him thy grace and thy holy spirit." Then they repeat the "Let us adore," the Lord's Prayer, and read the Gospel (John i. 1-17). This was the vital part of the whole rite. The *credens* is now a Perfect one; the Perfect ones present give him the kiss of peace, and the rite is over.

The Cathar Eucharist was equally primitive, and is thus described by a contemporary writer in a 13th-century ms. in the Milan Library:—"The Benediction of bread is thus performed by the Cathars. They all, men and women, go up to a table and standing up say the 'Our Father,' [as according to St. Gregory (*Ep.* ix. 12-26), was the custom of the apostles]. And he who is prior among them, at the close of the Lord's Prayer, shall take hold of the bread and say: 'Thanks be to the God of our Jesus Christ. May the Spirit be with us all.' And after that he breaks and distributes to all. And such bread is called bread blessed, although no one believes that out of it is made the body of Christ."

CATHARSIS means purification. Since the time of Aristotle the term has been definitely associated with the question of the effects of tragedy on the spectators or on the actors. Aristotle maintained that tragedy and also certain kinds of music tend to purify the spectators and listeners by artistically exciting certain emotions which act as a kind of homeopathic relief from their own selfish passions. Goethe was of opinion that the catharsis affects the actors in the tragedy rather than the spectators or readers. Lessing, on the other hand, held that it affects the spectators and readers rather than the performers. Lessing also maintained that catharsis takes the form of a sublimation of the emotions or their conversion into virtuous dispositions.

CATHARTIDAE: see **VULTURE**.

CATHAY, the name by which China became known to mediaeval Europe. It is derived from Khitai, the name of the kingdom of Khitan Tartars (10th and 11th centuries A.D.) which, based on Manchuria (the north-east gateway into China), included at times part of north China as well, and which towards its close had its capital at Yenking (Kublai Khan's *Cambaluc*, *q.v.*, and the modern Peking). The Central Asian Tartars, in touch only with its northern territories, knew China by this name and the Russians through contact with them introduced it into Europe. The Russians and the peoples of central Asia still know China as Khitai or Kitai. Although in Marco Polo's time all China was under the control of the Great Khan, he limits Cathay to the country north of the Yang-tze Valley and calls south China

by the separate name of Mangi. The distinction was at that time a real one, since Mangi retained the old Sung culture practically undiluted while Cathay bore the impress of the Tartar Conquest (see **CHINA**). In the 16th century, however, when European navigators following the sea-route via the Spice Islands reached Far Eastern waters it was Mangi which they knew as China and Cathay was understood as lying away to the north of it and to be reached by a still undiscovered sea-route. Hence ensued the search for the north-west and north-east passages from Europe to the renowned Cathay. This dualism corresponds to the much earlier distinction apparent in Roman literature between the *Seres*—the Chinese as approached by the overland route—and the *Sinae*—the Chinese as approached by the sea-route from the south. It was not until the early 17th century that the identity of the country and of the people reached by the two routes was realized.

CATHCART, SIR GEORGE (1794-1854), English soldier, third son of the 1st Earl Cathcart, was born in London on May 12, 1794. He was educated at Eton and Edinburgh university. In 1810 he entered the army, and in 1812 accompanied his father to Russia as aide-de-camp. He served with the Russian army in Germany in 1813 and in France in 1814, and in 1850 he published *Commentaries* on these campaigns. After the peace of 1814 he accompanied his father to the congress of Vienna. He was present at Quatre Bras and at Waterloo, as an aide-de-camp to the duke of Wellington, whom he accompanied to the congresses of Aix-la-Chapelle and Verona, and in 1826 to Prussia. Promoted lieutenant-colonel in 1826, he was placed on half-pay in 1834. In 1838 he was sent as commander of the King's Dragoon Guards to Canada. In March, 1852, he succeeded Sir Harry Smith as governor and commander-in-chief at the Cape, and brought the Kafir war to a successful conclusion. He promulgated the first constitution of Cape Colony, and conducted operations against the Basuto. Cathcart received a K.C.B. in 1853. In Dec., 1853, he was made adjutant-general of the army and was sent out to the Crimean War in command of the 4th division. He fell at the battle of Inkerman (Nov. 5, 1854) and his remains, with those of other officers, were buried on Cathcart's Hill.

See Colburn's *United Service Magazine*, Jan., 1855; *Correspondence of the Hon. Sir George Cathcart relative to Kaffraria* (1856); A. W. Kinglake's *Invasion of the Crimea*, vol. v.

CATHCART, WILLIAM SCHAW CATHCART, 1ST EARL (1755-1843), English soldier and diplomatist, was born at Petersham Sept. 17, 1755, and died at his estate near Glasgow June 16, 1843. In 1868 he went to St. Petersburg, where his father, the 9th Baron Cathcart (1721-76), was ambassador. Succeeding to the barony in 1776 he joined the army, and served in America, where he commanded an irregular corps, the "British Legion," and was quartermaster-general to the forces. From 1793 to 1795 he served with the 29th foot in the Low Countries, and was appointed commander-in-chief in Ireland, 1803-05, after which he commanded the British expedition to Hanover (1805). After his successful conduct of the expedition to Copenhagen, which surrendered to him in 1807, he was created Viscount Cathcart of Cathcart and Baron Greenock of Greenock. Promoted to the rank of general in 1812, he served in Russia, as ambassador and military commissioner, with the headquarters of the allies, throughout the War of Liberation (1812-14), and was raised to an earldom, for his services, in 1814.

His son, **CHARLES MURRAY CATHCART**, 2ND EARL (1783-1859), succeeded to the title in 1843. In 1800 he entered the 2nd Life Guards, and served in the Mediterranean (1805-06), in the Walcheren expedition of 1809, and at Barossa, Salamanca, and Vittoria. He was also present at Waterloo, after which he received the C.B. From 1846 to 1849 he was commander-in-chief in Canada; in 1859 he was raised to the rank of full general. Cathcart's interest in scientific pursuits led to his discovery, in 1841, of a new mineral which was named Greenockite.

CATHCART, a parish situated partly in Renfrewshire and partly in Lanarkshire, Scotland. Part of the parish was added to Glasgow in 1911. The Renfrewshire portion has the larger area

(2,387 acres), but the smaller population (4,649), the area of the Lanarkshire portion being 745 acres and the population (1931) 58,669, a large increase. The industries include paper-making and chemical manufactures. The parish includes the town of Cathcart (pop. 2,915), and the villages of Old and New Cathcart, but much of it, though outside the city boundaries, is practically continuous with some of the southern suburbs of Glasgow. The White Cart flows through the parish. In the 12th century Cathcart became a barony of the Cathcarts, who derived the title of their lordship (1460) and earldom (1814) from it. On the Queen's Knowe, a hillock near the ruins of Cathcart castle, a memorial marks the spot where Queen Mary watched the progress of the battle of Langside (1568), the site of which lies within the parish.

CATHEDRAL, more correctly "cathedral church" (*ecclesia cathedralis*), the church which contains the official "seat" or throne of a bishop—*cathedra*, one of the Latin names for this, giving us the adjective "cathedral." The adjective has gradually, for brevity of speech, assumed the character of a substantive.

History and Organization.—It was early decreed that the *cathedra* of a bishop was not to be placed in the church of a village, but only in that of a city. There was no difficulty as to this on the continent of Europe, where towns were numerous, and where the cities were the natural centres from which Christianity was diffused among the people who inhabited the surrounding districts. In the British isles, however, the case was different; towns were few and, owing to other causes, instead of exercising jurisdiction over definite areas or districts, many of the bishops were bishops of tribes or peoples, as the bishops of the South Saxons, the West Saxons, the Somersaetas and others. The *cathedra* of such a bishop was often migratory, and was at times placed in one church, and then another, and sometimes in the church of a village. In 1075 a council was held in London, under the presidency of Archbishop Lanfranc, which, reciting the decrees of the council of Sardica held in 347 and that of Laodicea held in 360 on this matter, ordered the bishop of the South Saxons to remove his see from Selsey to Chichester; the Wilts and Dorset bishop to remove his *cathedra* from Sherborne to Old Sarum, and the Mercian bishop, whose *cathedra* was then at Lichfield, to transfer it to Chester. Traces of the tribal and migratory system may still be noted in the designations of the Irish see of Meath (where the result has been that there is now no cathedral church) and Ossory, the cathedral church of which is at Kilkenny. Some of the Scottish sees were also migratory. Occasionally two churches jointly share the distinction of containing the bishop's *cathedra*. In such case they are said to be con-cathedral in relation to each other. Instances of this occurred in England before the Reformation in the dioceses of Bath and Wells, and of Coventry and Lichfield. Hence the double titles of those dioceses. In Ireland an example occurs at Dublin, where Christ Church and St. Patrick's are jointly the cathedral churches of that diocese. Cathedral churches are reckoned as of different degrees of dignity: (1) the simple cathedral church of a diocesan bishop, (2) the metropolitan church to which the other diocesan cathedral churches of a province are suffragan, (3) the primatial church under which are ranged metropolitan churches and their provinces, (4) patriarchal churches to which primatial, metropolitan and simple cathedral churches alike owe allegiance. The title of "primate" was occasionally conferred on metropolitans of sees of great dignity or importance, such as Canterbury, York, Rouen, etc., whose cathedral churches remained simply metropolitan. The removal of a bishop's *cathedra* from a church deprives that church of its cathedral dignity, although often the name clings in common speech, as for example at Antwerp, which was deprived of its bishop at the French Revolution.

The history of the body of clergy attached to the cathedral church is obscure, and as in each case local considerations affected its development, all that can be attempted is to give a general outline of the main features which were more or less common to all. Originally the bishop and cathedral clergy formed a kind of religious community, which, in no true sense a monastery, was nevertheless often called a *monasterium*. The word had not the restricted meaning which it afterwards acquired. Hence the ap-

parent anomaly that churches like York and Lincoln, which never had any monks attached to them, have inherited the name of minster or monastery. In these early communities the clergy often lived apart in their own dwellings, and were not infrequently married. During the two centuries, roughly bounded by the years 900 and 1100, the cathedral clergy became more definitely organized, and were also divided into two classes. One was that of a monastic establishment of some recognized order of monks, very often that of the Benedictines, while the other class was that of a college of clergy, living in the world, and bound by no vows, except those of their ordination, but governed by a code of statutes or canons. Hence the name of "canon" given to them. In this way arose the distinction between the monastic and secular cathedral churches. In England the monastic cathedral churches were Bath, Canterbury, Carlisle, Coventry, Durham, Ely, Norwich, Rochester, Winchester and Worcester, all of them Benedictine except Carlisle, which was a church of Augustinians. The secular churches were Chichester, Exeter, Hereford, Lichfield, Lincoln, St. Paul's (London), Salisbury, Wells, York and the four Welsh cathedral churches. In Ireland all were secular except Christ Church, Dublin (Augustinian) and Down (Benedictine), and none, even in their earliest days, were ever, it is believed, churches of recognized orders of monks, except the two named. In Scotland St. Andrew's was Augustinian, Elgin (or Moray), Glasgow and Aberdeen were always secular, and ordered on the models of Lincoln and Salisbury. Brechin had a community of Culdees till 1372, when a secular chapter was constituted. The cathedral church of Galloway, at Whithorn, of English foundation, was a church of Praemonstratensians. In the case of monastic cathedral churches there were no dignitaries, the internal government was that of the order to which the chapter belonged, and all the members kept perpetual residence. The reverse of this was the case with the secular chapters; the dignities of provost, dean, precentor, chancellor, treasurer, etc., soon came into being, for the regulation and good order of the church and its services, while the non-residence of the canons, rather than their perpetual residence, became the rule, and led to their duties being performed by a body of "vicars," who officiated for them at the services of the church.

The normal constitution of the chapter of a secular cathedral church comprised four dignitaries (there might be more), in addition to the canons. The dean (*decanus*) seems to have derived his designation from the Benedictine dean who had ten monks under his charge. The dean, as already noted, came into existence to supply the place of the provost in the internal management of the church and chapter. In England the dean was the head of all the secular cathedral churches, and was originally elected by the chapter and confirmed in office by the bishop. He is president of the chapter, and in church has charge of the due performance of the services, taking specified portions of them by statute on the principal festivals. He sits in the chief stall in the choir, which is usually the first on the right hand on entering the choir at the west. Next to the dean (as a rule) is the precentor (*primicerius*, *cantor*, etc.), whose special duty is that of regulating the musical portion of the services. He presides in the dean's absence, and occupies the corresponding stall on the left side, although there are exceptions to this rule, where, as at St. Paul's, the archdeacon of the cathedral city ranks second and occupies what is usually the precentor's stall. The third dignitary is the chancellor (*scholasticus*, *écolâtre*, *capiscol*, *magistral*, etc.), who must not be confounded with the chancellor of the diocese. The chancellor of the cathedral church is charged with the oversight of its schools, ought to read divinity lectures, and superintend the lections in the choir and correct slovenly readers. He is often the secretary and librarian of the chapter. In the absence of the dean and precentor he is president of the chapter. The easternmost stall, on the dean's side of the choir, is usually assigned to him. The fourth dignitary is the treasurer (*custos*, *sacrista*, *cheficier*). He is guardian of the fabric, and of all the furniture and ornaments of the church, and his duty was to provide bread and wine for the eucharist, and candles and incense, and he regulated such matters as the ringing of the bells. The treasurer's stall

EXAMPLES OF CATHEDRAL ARCHITECTURE FROM THE 11TH TO THE 20TH CENTURY

Although a cathedral is usually large, a small building can serve, as in the case of the tiny cathedral at Athens. Salisbury and Beauvais represent the English and French phases of Gothic; that of Seville shows the Spanish style; the Moscow example is characteristic of Russian 16th and 17th century churches, and Westminster cathedral (Roman Catholic) and the cathedral of St. John the Divine are typical adaptations of Byzantine and Gothic precedents to the needs of a modern cathedral.

is opposite to that of the chancellor. These four dignitaries, occupying the four corner stalls in the choir, are called in many of the statutes the "*quatuor majores personae*" of the church. In many cathedral churches there were additional dignitaries, as the praelector, subdean, vice-chancellor, succentor-canonorum and others, who came into existence to supply the places of the other absent dignitaries, for non-residence was the fatal blot of the secular churches, and in this they contrasted very badly with the monastic churches, where all the members were in continuous residence. Besides the dignitaries there were the ordinary canons, each of whom, as a rule, held a separate prebend or endowment, besides receiving his share of the common funds of the church. For the most part the canons also speedily became non-resident, and this led to the distinction of residentiary and non-residentiary canons, till in most churches the number of resident canons became definitely limited in number, and the non-residentiary canons, who no longer shared in the common funds, became generally known as prebendaries only, although by their non-residence they did not forfeit their position as canons, and retained their votes in chapter like the others. This system of non-residence led also to the institution of vicars choral, each canon having his own vicar, who sat in his stall in his absence, and when the canon was present, in the stall immediately below, on the second form. The vicars had no place or vote in chapter, and, though irremovable except for offences, were the servants of their absent canons whose stalls they occupied, and whose duties they performed. Abroad they were often called demi-prebendaries, and they formed the *bas chœur* of the French churches. As time went on the vicars were themselves often incorporated as a kind of lesser chapter, or college, under the supervision of the dean and chapter. There was no distinction between the monastic cathedral chapters and those of the secular canons, in their relation to the bishop or diocese. In both cases the chapter was the bishop's *consilium* which he was bound to consult on all important matters and without doing so he could not act. Thus, a judicial decision of a bishop needed the confirmation of the chapter before it could be enforced. He could not change the service books, or "use" of the church or diocese, without capitular consent, and there are many episcopal acts, such as the appointment of a diocesan chancellor, or vicar general, which still need confirmation by the chapter.

All the English monastic cathedral chapters were dissolved by Henry VIII., and, except Bath and Coventry, were refounded by him as churches of secular chapters, with a dean as the head, and a certain number of canons ranging from twelve at Canterbury and Durham to four at Carlisle, and with certain subordinate officers as minor canons, gospellers, epistolers, etc. The precentorship in these churches of the "New Foundation," as they are called, is not, as in the secular churches of the "Old Foundation," a dignity, but is merely an office held by one of the minor canons.

English cathedral churches, at the present day, may be classed under four heads: (1) the old secular cathedral churches of the "Old Foundation," enumerated in the earlier part of this article; (2) the churches of the "New Foundation" of Henry VIII., which are the monastic churches already specified, with the exception of Bath and Coventry; (3) the cathedral churches of bishoprics founded by Henry VIII., viz., Bristol, Chester, Gloucester, Oxford and Peterborough (the constitution of the chapters of which corresponds to those of the New Foundation); (4) modern cathedral churches of sees founded since 1836, viz., (a) Manchester, Ripon and Southwell, formerly collegiate churches of secular canons; (b) St. Albans and Southwark, originally monastic churches; (c) Truro, Newcastle and Wakefield, formerly parish churches, (d) Birmingham and Liverpool, originally district churches. The ruined cathedral church of the diocese of Sodor (*i.e.*, the Southern Isles) and Man, at Peel, in the Isle of Man, appears never to have had a chapter of clergy attached.

Architecture.—The architectural importance of the cathedral arises not from any specific differences between cathedrals and other churches but from the fact that cathedral building is intimately associated with the development of Gothic architecture (*see* GOTHIC ARCHITECTURE). The archaeologists of the late 19th century considered the rise of the secular clergy in the 12th and 13th centuries the most important factor in the birth of Gothic architecture. Contemporary (1928) critical opinion discounts this, and points out that Gothic ideas first had tentative expression in the abbey church of St. Denis, near Paris (1140). It is nevertheless a fact that the construction of many large cathedral churches in France, in the second half of the 12th century, furnished architects with many new structural and aesthetic problems. Public opinion of the time, generally in revolt against the feudal domination of the great monasteries, broke the controlling sway of monastic architectural tradition, and lay architects became the rule rather than the exception. The development that followed in the half century between 1150 and 1200, in which many discreet Romanesque experiments in vaulting, window and door design, stained glass, buttressing and planning, particularly of the east end, reached a compelling synthesis, is unique in architectural history. In the domain of the Eastern Church, where no such break between lay and monastic clergy occurred, it is significant that there was no such architectural development; Russian cathedrals remained simple Russo-Byzantine churches up to the 18th century.

Recent times have witnessed the renaissance of the idea of the cathedral as a great popular monument. This movement is evidenced in the magnificent Liverpool cathedral, designed by Sir Giles Gilbert Scott in a free and modernized Gothic style, and in the Gothic cathedral of S. John the Divine in New York, begun by Heinz and LaFarge and now (1928) entirely remodelled and in course of completion by Ralph Adams Cram; and that at Washington, D.C., by Frohman, Robb and Little. These great modern cathedrals differ from earlier examples in their recognition of the fact that in them the congregation is of relatively greater importance than the clergy and choir and the consequent attempt to obtain enormous open spaces as close as possible to the chancel. In general, the eastern arm and the transepts are thereby shorter than the usual Gothic proportion, whereas the crossing is given immensely greater importance. (*See* APSE; RELIGIOUS AND MEMORIAL ARCHITECTURE; BYZANTINE AND ROMANESQUE ARCHITECTURE; GOTHIC ARCHITECTURE.)

CATHELINEAU, JACQUES (1759-1793), French Vendean chieftain during the Revolution, was born on Jan. 5, 1759, at Tin-en-Manges, Maine-et-Loire. In the first years of the Revolution, Cathelineau listened to the exhortations of Catholic priests and royalist *émigrés*, and joined the insurrection provoked by them against the revolutionary government. Collecting a band of peasants and smugglers, he took the chateau of Gallais, where he captured a cannon, christened by the Vendéans the "Missionary"; he then took the towns of Chemillé, Cholet, Vihiers and Chalonnes (March, 1793). His companions committed atrocities which brought upon them terrible reprisals on the part of the Republicans. Meanwhile Cathelineau's troops increased, and he combined with the other Vendean chiefs, such as N. Stofflet and Gigot d'Elbée, taking the towns of Beaupreau, Fontenay and Saumur. The first successes of the Vendéans were due to the fact that the Republicans had not expected an insurrection. When the resistance to the insurgents became more serious differences arose among their leaders. To avoid these rivalries, it is thought that Cathelineau was named generalissimo of the rebels, though his authority over the undisciplined troops was not increased by the new office. In 1793, all the Royalist forces tried to capture Nantes. Cathelineau entered the town

in spite of the resistance of Gen. J. B. Clanclaux, but he was killed, and the Vendean army broke up. Numerous relatives of Cathelineau also perished in the war of La Vendée. (See also VENDÉE and CHOUANS.)

See C. Port, "La Légende de Cathelineau" in the review *La Révolution Française*, vol. xxiv. (1893).

CATHER, WILLA SIBERT (1876–), American author, was born at Winchester, Va., on Dec. 7, 1876 and as a child of eight or nine was taken to a Nebraska ranch. After her graduation from the University of Nebraska in 1895, she taught English in the Allegheny high-school, worked on the *Pittsburgh Leader* and travelled widely. Her first volume of stories, *The Troll Garden* (1905), led to an appointment as associate editor of *McClure's Magazine* (1906–12), which was then a vigorous periodical, a pioneer in the field of magazine journalism, less dignified than the old monthlies, but alive with the spirit of reform and direct appeal to an ever increasing audience more interested in substance than in form. Miss Cather's first distinguished work in pure literature was *O Pioneers!* (1913), in which, on Sarah Orne Jewett's advice, she endeavoured to recapture "in memory, people and places" which she believed to be forgotten. With it she put herself in the forefront of those who had begun to realize the importance of pioneer life in America. *My Antonia* (1918) was another book with the same general background, which established her reputation as a novelist of unusual depth and power of beauty, who could see deep currents of emotion running in those Main Streets and prairies which Sinclair Lewis was to satirize for their decline into dullness. In *One of Ours* (1922), she stepped aside, not altogether successfully, to tell a story of a Western boy in the World War. This novel was awarded a Pulitzer prize. *The Song of the Lark* (1915) was another pioneer story; *A Lost Lady* (1923) was also told against a prairie background, but its simplicity of telling, its depth of tragedy and fineness of insight into the secret and the weakness of woman's charm far outweigh the interest of its local colour. In *The Professor's House* (1925), she began experiments with a new technique of story-telling, constructing her story of an intellectual's soul development according to the familiar methods of music. In *Death Comes for the Archbishop* (1927), she told in the form of a chronicle a simple and vivid story of two saints of the South-west. This and *The Lost Lady* are her best books. Mention should be made of her short stories, best read in the collection *Youth and the Bright Medusa* (1920), in which she has escaped the stereotyping that has devitalized so many American short-story writers. Her first book was in verse, *April Twilights* (1903); her first novel *Alexander's Bridge* (1912).

Among the writers who in the early 20th century have deepened and refined the study of American character, Willa Cather is perhaps pre-eminent. Her style is restrained, sometimes almost cold, but rising into passages of great beauty, and always in harmony with her subject. Her themes are broader and more human than Mrs. Wharton's; her analysis of human motives deeper than Tarkington's; and she is perhaps closer to essential Americanism in its spiritual and emotional aspects than any other contemporary writer. She is not rich in humour, nor pointed in satire, and in this differs from her nearest contemporaries, but she comes closest in American literature of this period to the classic ideal of balance, insight, restraint.

See articles on her work by T. K. Whipple in *Spokesmen: Modern Writers and American Life*; A. Porterfield, *Contemporary American Authors*, edited by J. C. Squire; Elizabeth S. Sergeant, *Fire Under the Andes* (1927). (H. S. C.)

CATHERINE, SAINT. The Roman hagiology contains six saints of this name. 1. ST. CATHERINE OF ALEXANDRIA, virgin and martyr, whose day of commemoration recurs on Nov. 25. 2. ST. CATHERINE OF SIENA, 1347–80, Dominican tertiary whose feast is observed on April 30. 3. ST. CATHERINE OF SWEDEN, daughter of St. Bridget, who died abbess of Watzen in 1381, and is commemorated on March 22. 4. ST. CATHERINE OF BOLOGNA, 1413–63, abbess of the Poor Clares in Bologna, canonized by Pope Benedict XIII., and commemorated by Franciscans on March 9. 5. ST. CATHERINE OF GENOA (1447–1510), who belonged to the

noble family of Fieschi, devoted her life to the sick, especially during the plague at Genoa in 1497 and 1501. She was beatified by Clement V. in 1675 and canonized by Clement XII. in 1737, her feast being on July 22. See F. von Hügel, *The Mystical Element in Religion as studied in St. Catherine of Genoa*, 2nd ed. (1923). 6. ST. CATHERINE DE' RICCI, of Florence (1522–89), became a Dominican nun at Prato. She was famous during her lifetime for the weekly ecstasy of the Passion, during which she experienced the sufferings of the Holy Virgin contemplating the Passion of her Son. She was canonized in 1746 by Benedict XIV., who fixed her festal day on Feb. 13. In Celtic and English martyrologies (Nov. 25) there is also commemorated St. Catherine Audley (c. 1400), a recluse of Ledbury, Hereford, who was reputed for piety and clairvoyance.

Of the first two saints something more must be said. Of St. Catherine of Alexandria, history has little to tell. According to the legend recorded in the Roman martyrology, and in Simeon Metaphrastes, Catherine upbraided the Emperor Maximinus for his cruelties, and adjured him to give up the worship of false gods. The angry tyrant, unable to refute her arguments, sent for pagan scholars to argue with her, but they were discomfited. Catherine was then scourged and imprisoned. When the empress went to reason with her, Catherine converted her as well as the Roman general and his soldiers, who had accompanied her. Maximinus now ordered her to be broken on the wheel; but the wheel was shattered by her touch. The axe proved fatal, and the martyr's body was borne by angels to Mt. Sinai, where Justinian I. built the famous monastery in her honour. Another variation of the legend is that in which, having rejected many offers of marriage, she was taken to Heaven in vision and betrothed to Christ by the Virgin Mary.

Of these marvellous incidents very little, by the universal admission of Catholic scholars, has survived the test of modern criticism, though her actual existence is generally admitted. In the middle ages she was a most popular saint, her festival being, in certain dioceses of France, a holy day of obligation even as late as the 17th century. The wheel being her symbol, she was the patron saint of wheelwrights and mechanics, as well as the tutelary saint of nuns and maidens.

St. Catherine of Siena, the youngest daughter of a dyer, was born on March 25, 1347. At an early age she began to practise asceticism and see visions, and when seven dedicated her virginity to Christ. In 1363 she became a Dominican tertiary, and renewed in her home the life of the anchorites in the desert. She resumed family life in 1366 when she began to tend the sick and the poor. Her peculiarities excited suspicion, and charges seem to have been brought against her by some of the Dominicans, to answer which she went to Florence in 1374, soon returning to Siena to tend the plague-stricken. At the invitation of the ruler of Pisa she visited that city in 1375 to arouse enthusiasm for the proposed crusade, and to prevent Pisa and Lucca joining the Tuscan league against the pope. While at Pisa, on April 1, she is said to have received the *stigmata* or impression on her hands, feet and heart, of the wounds of the crucified Christ, but by her prayer the marks were made invisible. In 1376, Catherine resolved to bring back Pope Gregory XI. from Avignon, attempting first by correspondence to reconcile Gregory and the Florentines, who had been placed under an interdict, and then going in person as the representative of the latter to Avignon. Gregory empowered her to treat for peace, but the Florentine ambassadors proved faithless. Catherine, however, was able to persuade the pope to return to Genoa and then to push on to Rome. There he found life very difficult, and in 1378 sent Catherine on an embassy to Florence, especially to the Guelph party. While she was urging the citizens to make peace with the pope there came the news of his death. During the troubles that ensued in Florence, Catherine nearly lost her life, and sorely regretted not winning her heart's desire, "the red rose of martyrdom." Peace was signed with the new pope, Urban VI., and Catherine, having accomplished her second great political task, went home to Siena. Thence on the outbreak of the schism Urban summoned her to Rome, where she quelled the revolt of the people and tried to win for Urban the support of Europe.

Under the great strain, she died on April 29, 1380, and was canonized by Pius II. in 1461.

Catherine lived on in her writings and disciples. Among the latter were her confessor and biographer, Fra Raimondo, later master-general of the Dominicans, William Flete, an ascetically-minded Cambridge man, Stephano Maconi, who became prior-general of the Carthusians, and the two secretaries, Neri di Landoccio and Francesco Malavolti. The last of her band of reformers, Tommaso Caffarini, died in 1434, but the work was taken up by Savonarola. Catherine's writings consist of: (1) a dialogue entitled, *The Book of Divine Doctrine, given in person by God the Father, speaking to the mind of the most glorious and holy virgin Catherine of Siena, and written down as she dictated it in the vulgar tongue, she being the while entranced, and actually hearing what God spoke in her*. The book has a significant place in the history of Italian literature. "In a language which is singularly poor in mystical works it stands with the *Divina Commedia* as one of the two supreme attempts to express the eternal in the symbolism of a day, to paint the union of the soul with the suprasensible while still imprisoned in the flesh." (2) The prayers (26 in all) which are mostly mystical outpourings. (3) Letters, nearly 400, addressed to kings, popes, cardinals, bishops, conventual bodies, political corporations and individuals. By their historical importance, their spiritual fragrance, their literary value, and their beautiful Tuscan vernacular, the letters put their author almost on a level with Petrarch.

AFTER A WOODCUT FROM "CATHARINA DA SIENA," 1500

ST. CATHERINE OF SIENA

BIBLIOGRAPHY.—The *Vita* or *Legenda*, Fra Raimondo's biography, written 1384–95, first published in Latin at Cologne, 1553, and widely translated; the *Processus*, a collection of testimonies and letters made in 1411 by her followers; the *Supplementum* to Raimondo's *Vita*, compiled by Tommaso Caffarini in 1414; the *Letters*, standard edition by Girolamo Gigli (Siena, 1713, Lucca, 1721), an English selection by V. D. Scudder (1905). A complete bibliography is given in E. G. Gardner's *Saint Catherine of Siena* (1907).

CATHERINE I. (1683–1727), empress of Russia, was the daughter of a Lithuanian peasant named Skavronsky, who died when she was a child. Martha Skavronsky became a servant in the house of Pastor Glück, the Protestant superintendent of the Marienburg district, and married a Swedish dragoon called Johan. When the Swedes evacuated Marienburg, Martha became one of the prisoners of war of Marshal Sheremetev, who sold her to Prince Menshikov, at whose house, Peter the Great became her lover. After the birth of their first daughter Catherine, Martha was received into the Orthodox Church, when she was rechristened under the name of Catherine Alexeyevna, the tsarevich Alexius being her godfather. She received the title *Gosudarinya* or sovereign (1710), and Peter, who had divorced the tsaritsa Eudoxia, married her in 1711. Henceforth the new tsaritsa was her husband's inseparable companion. She was with him during the campaign of the Pruth, and Peter always attributed the successful issue of that disastrous war to her courage and sang-froid. She was with him, too, during his earlier Caspian campaigns. He was devoted to her, and she was able to act as a buffer between the tsar and his advisers in his frequent accessions of rage.

By the *ukaz* of 1722 Catherine was proclaimed Peter's successor, to the exclusion of the grand-duke Peter, the only son of the tsarevich Alexius, and on May 7, 1724, was solemnly crowned empress-consort in the Uspensky cathedral at Moscow, on which occasion she wore a crown studded with no fewer than 2,564 precious stones, surmounted by a ruby, as large as a pigeon's egg, supporting a cross of brilliants. Within a few months

of her coronation a dangerously familiar flirtation with her gentleman of the chamber, William Mons, caused some scandal. Mons was decapitated and his severed head, preserved in spirits, was placed in the apartments of the empress, but she attended Peter during his last illness, and closed his eyes when he died (Jan. 28, 1725). She was at once raised to the throne by the party of Prince Menshikov and Count Tolstoy with the support of the Guards.

The great administrative innovation of Catherine's reign was the establishment of the *Verkhovny Tainy Sovyet*, or supreme privy council. The executive power was thus concentrated in the hands of a few persons, mainly of the party of Reform (*ukaz* of Feb. 26, 1726). The foreign policy of Catherine I. was principally directed by the astute Andrei Ostermann. Russia now found herself opposed to England, chiefly because Catherine protected Charles Frederick, duke of Holstein, and George I. found that the Schleswig-Holstein question might be reopened to the detriment of his Hanoverian possessions. In the spring of 1726, an English squadron was sent to the Baltic and cast anchor before Reval. The empress protested, and the fleet was withdrawn, but on Aug. 6 Catherine acceded to the anti-English Austro-Spanish league. Catherine died on May 16, 1727. Though quite illiterate, she was an uncommonly shrewd, sensible and good-tempered woman. Her personal extravagance was a byword.

See the authorities referred to s.v. PETER THE GREAT.

CATHERINE II. (1729–1796), empress of Russia, known as CATHERINE THE GREAT, was the daughter of Christian Augustus, prince of Anhalt-Zerbst, and his wife, Johanna Elizabeth of Holstein-Gottorp. She was born at Stettin on May 2, 1729. Her baptismal name was Sophia Augusta Frederica. In 1744 she was taken to Russia, to be affianced to the grand-duke Peter (afterwards Peter III.), the nephew of the empress Elizabeth, and her recognized heir. Frederick the Great favoured the alliance, his object being to strengthen the friendship between Prussia and Russia, to weaken the influence of Austria and to ruin the chancellor Bestuzhev, who was a known partisan of the Austrian alliance. The diplomatic intrigue failed, but Elizabeth took a strong liking to Sophia, and the marriage was finally decided on. On June 28, 1744, she was received into the Orthodox Church at Moscow, and was renamed Catherine Alexeyevna. On the 29th she was formally betrothed, and was married on Aug. 21, 1745 at St. Petersburg. Her married life was wretched. Peter was subnormal in physique and in mind, and his wife despised him. She was a clever and ambitious girl, and was determined that nothing should stand in the way of her ambitions. She accepted the conditions of her marriage because it was the means to power. During the 17 years of her life as grand-duchess she matured her mind and avoided a breach with Elizabeth. For ten years the marriage was barren, and the only reason for supposing that the future tsar Paul, who was born on Oct. 2, 1754, was the son of Peter, is the strong similarity of their characters. Catherine had many lovers. The scandalous chronicle of her life was the commonplace of all Europe. Her most trusted agents while she was still grand-duchess, and her chief ministers when she became empress, were also her lovers.

The Empress Elizabeth died on Jan. 5, 1762. The grand-duke succeeded without opposition as Peter III. He committed every possible folly, grovelled before Frederick the Great, insulted the Church, and threatened to divorce Catherine. She refrained from open opposition and acted with the political prudence which she had shown as grand-duchess. In July Peter foolishly retired with his Holsteiners to Oranienbaum, leaving his wife at St. Petersburg. On the 13th and 14th of that month, a "pronunciamiento" of the regiments of the guard removed him from the throne and made Catherine empress. She issued a manifesto in which she claimed to stand for the defence of Orthodoxy, and the glory of Russia. The guards were manipulated by the four Orlov brothers. The eldest, Gregory, was her recognized chief lover, and he was associated with his brother Alexis in the office of favourite. But the hatred felt for Peter III. was spontaneous, and Catherine had no need to do more than let it be known that she was prepared to profit by her husband's downfall. Peter was sent to a country

house at Ropcha, where he died on July 17 in the course of a scuffle during dinner. His custodian, Alexis Orlov, said he could not remember what happened. Catherine in a second manifesto said she had accepted the throne for the good of the country and remarked that autocracy was a danger if the ruler lacked the requisite qualities.

Catherine the Great ruled Russia for 34 years. Although born a German princess she identified herself completely with the Russian people. She was in the truest sense the successor of Peter the Great. Her private life was the object of unceasing curiosity and interest among her contemporaries, and a mass of literature has grown up around the subject of her lovers and her relations with them. Catherine was never dominated by her lovers who were the instruments of her policy; it was she who governed Russia, not her favourites. Her main interests were intellectual and political, and her love affairs subsidiary. She was the disciple and friend of the Encyclopaedists, especially of Voltaire, the reading of whose works had first awakened her mind. She corresponded with him, with D'Alembert, and, more voluminously, with F. M. Grimm, who spent nearly a year at her court in 1777-78. Grimm reports that her conversation was even more brilliant than her letters. Catherine also corresponded at intervals with Frederick the Great and with Joseph II. Her letters are graceful and witty, and they show real political and diplomatic insight. She was determined to make Russian society as cultivated as the society of Paris and Berlin. At court she insisted on a high standard of decorum and of manners, she encouraged the nobles to travel, and fostered the love of French culture. She herself employed Grimm and others to collect works of art and antiquities for her, and practised sculpture and painting herself. She had a passion for reading, made a digest of Blackstone's *Commentaries* and found Buffon's *Histoire naturelle* light reading. Her enthusiasm for Russian history led her to begin to write a history of Russia from the earliest times, and she completed a play, having for its hero the legendary Oleg, which she said was an imitation of Shakespeare. Her comedies, proverbs, and tales are very numerous. To find time for all her activities she rose at five, made her own fire, and would sometimes work 15 hours a day. She seemed to have worked in bouts, taking long spells of work with intervals of relaxation. The new culture which she sought to impose on her court was not entirely superficial. She herself was kind and reasonable to her servants. She was not revengeful, and when she usurped the throne showed no hostility to her husband's advisers; nevertheless she had a fund of hardness, and showed little kindness to her son Paul.

Since Catherine was a disciple of the Encyclopaedists it was natural that she should start out with the definite intention of carrying out domestic reform in Russia, though by methods of the benevolent despotism fashionable in Europe in the period before the French Revolution shook the fabric of society. In fact she, a foreigner and usurper, had to depend for support on the nobility, whose privileges she vastly increased by relieving them of the duty of military service and giving them new powers over their serfs. She also increased their numbers by grants of Crown lands. Serfdom was not mitigated, but vastly increased under her rule. The terrible condition of the peasants led to one revolt after another in favour of one of the numerous pretenders, which culminated in the widespread rising on the Volga, the jacquerie led by Pugachev (1773-75). French culture among the landowners did not lead to any improvement in the handling of the peasants. This state of affairs was in startling contrast with the humanitarian tone of the *Instructions* which Catherine drew up for the grand commission which she summoned in Dec. 1766 to Moscow to advise on internal reform. The *Instructions*, based principally on the works of Montesquieu and Beccaria, were so radical that their circulation in France was forbidden. Very little came of the 18 months' work of the grand commission, except in the development of the organization of local government. With the outbreak of the French Revolution Catherine, like other European sovereigns, fell back on methods of repression. Radishchev, who wrote in his *Journey from St. Petersburg to Moscow* (1790) a truthful account of the condition of the peasants, was banished

to Siberia, though the sentiments expressed were only those of Catherine's own *Instructions* of 1766. Catherine had some able assistants in her domestic administration, notably Sivers.

The foreign policy of her reign aimed at the expansion of Russia, and from that point of view was brilliantly successful. Catherine knew the limits to which she could safely go in the "russification" of frontier districts, and showed a certain liberality to the populations which she incorporated. She conducted her own foreign policy, and the galaxy of excellent soldiers and diplomats which she gathered round her carried out her instructions implicitly. She had the gift of discovering ability, and kept in the closest touch with all her servants. Among her generals were Alexander Galitsin, Rumyantsev, Peter Panin, Suvorov, and Potemkin. Suvorov was one of the greatest of Russian generals, but he never enjoyed quite the confidence she gave to Potemkin, whose military abilities were mediocre, but who was first her lover and then her close friend and correspondent. Her chief advisers and assistants in foreign business were Nikita Panin, Besborodko, Repnin, Dmitri Galitsin and Vorontsoff. The story of the two shameless partitions of Poland and of the wars with Turkey which gave Russia the Crimea and free access to the Black sea for the products of the Ukraine is told under RUSSIA: *History*. It is sufficient to say here that the extension of Russian territory during her reign to the Niemen and the Dniester on the west, and to the Black sea on the south must be placed primarily to the account of Catherine's diplomacy and direction, well served as she was by her generals and her ministers.

She died on Nov. 10, 1796, of apoplexy.

The original sources for the history of her policy and her character are to be found in the publications of the Imperial Russian Historical Society, vols. i.-cix. (St. Petersburg), begun in 1867; her private and official correspondence will be found in vols. i., ii., iv., v., vi., vii., viii., ix., x., xiii., xiv., xv., xvii., xx., xxiii., xxxii., xxxiii., xxxvi., xlii., xliii., xlvii., xlviii., li., lvii., lviii., lxxvii., xcvi., xcvi., xcvi., cxv., cxviii. The *Mémoires de l'impératrice Catherine II., écrits par elle-même* (London 1859), with pref. by Alex. Herzen, bring her life up to the end of 1759, but were not begun until 1780. They must be used with caution, especially as regards her husband Peter III. See also A. Brückner, "Katharina die Zweite," in *Allgemeine Geschichte in Einzeldarstellungen* (Berlin 1883); O. Hoetzsch, "Catherine II.," in *Cambr. Mod. Hist.* vol. vi., where a bibliography will be found. A complete bibliography was prepared by B. von Bibbassoff, *Katharina II., Kaiserin von Russland in Urtheile der Weltliteratur* (Berlin, 1897). See also Princesse Lucien Murat, *La vie amoureuse de la grande Catherine* (1927); *Mémoires*, trs. by Katherine Anthony (1927); *Correspondence with Sir Charles Hanbury-Williams*, ed. and trans. by the Earl of Ilchester and Mrs. Langford-Brooke (1928).

CATHERINE DE MEDICI (1519-1589), queen of France, was born in Florence in 1519. She was a daughter of Lorenzo II. de Medici and a French princess, Madeleine de la Tour d'Auvergne. Having lost both her parents at an early age, Catherine was sent to a convent to be educated; and she was only 14 when she was married (1533) at Marseilles to the duke of Orleans, afterwards Henry II. It was her uncle, Pope Clement VII., who arranged the marriage with King Francis I., Henry's father, who was glad to strengthen his influence in the Italian peninsula. For ten years after her marriage she had no children. In consequence, a divorce began to be talked of at court. But Catherine had the happiness of bringing her husband grandchildren ere he died. During his reign (1547-59), Catherine lived a quiet and passive but observant life. Henry being completely under the influence of his mistress, Diane de Poitiers, she had little authority. In 1552, when the king left the kingdom for the campaign of Metz, she was nominated regent, but with very limited powers. This continued even after the accession of her son Francis II. Francis was under the spell of Mary Stuart, and she, little disposed to meddle with politics on her own account, was managed by her uncles, the cardinal of Lorraine and the duke of Guise. The queen-mother, however, soon grew weary of the domination of the Guises, and entered upon a course of secret opposition. On April 1, 1560, she placed in the chancellorship Michel de l'Hôpital (*q.v.*), who advocated the policy of conciliation.

On the death of Francis (Dec. 5, 1560), Catherine became regent during the minority of her second son, Charles IX. She was then 41 years old, but, although she was the mother of nine children, she was still very vigorous and active. She retained her in-

fluence for more than 20 years in the troubled period of the wars of religion. At first she listened to the moderate counsels of l'Hôpital in so far as to avoid siding definitely with either party. Like so many of the Italians of that time she looked upon statesmanship as a career in which finesse, lying and assassination were the most effective weapons. By habit a Catholic, but above all things fond of power, she was determined to prevent the Protestants from getting the upper hand, yet resolved not to allow them to be utterly crushed, in order to use them as a counterpoise to the Guises. This trimming policy met with little success; rage and suspicion so possessed men's minds that she could no longer control the opposing parties, and one civil war followed another to the end of her life.

In 1567, after the "Enterprise of Meaux," she dismissed l'Hôpital and joined the Catholic Party. But, having failed to crush the Protestant rebellion by arms, she resumed in 1570 the policy of peace and negotiation. She conceived the project of marrying her favourite son, the duke of Anjou, to Queen Elizabeth of England, and her daughter Margaret to Henry of Navarre. To this end she became reconciled with the Protestants, and allowed Coligny to return to court and to re-enter the council. Of this step she quickly repented. Charles IX. conceived a great affection for the admiral and showed signs of taking up an independent attitude. Catherine, thinking her influence menaced, sought to regain it, first by the murder of Coligny, and, when that had failed, by the massacre of St. Bartholomew (*q.v.*). The chief responsibility for this crime, therefore, rests with Catherine; unlike the populace, she had not even the excuse of fanaticism. After the death of Charles in 1574, and the succession of Anjou under the name of Henry III., Catherine pursued her old policy of compromise and concessions; but as her influence is lost in that of her son, it is unnecessary to dwell upon it. She died on Jan. 5, 1589, a short time before the assassination of Henry, and the consequent extinction of the House of Valois.

In her taste for art and her love of magnificence and luxury, Catherine was a true Medici; in architecture especially she was well versed, and Philibert de l'Orme relates that she discussed with him the plan and decoration of her palace of the Tuileries. Catherine's policy provoked a crowd of pamphlets, the most celebrated being the *Discours merveilleux de la vie, actions et déportemens de la reine Catherine de Médicis*, in which Henri Estienne undoubtedly collaborated.

A. Baschet, 1866); H. Bouchot, *Catherine de Médicis* (1899). For a more complete bibliography see Ernest Lavisse, *Histoire de France* (vol. v., by H. Lemonnier, and vol. vi. by J. H. Mariéjol, 1904-05). See also the books of E. Sichel, *Catherine de' Medici and the French Reformation* (1905) and *The Later Years of Catherine de' Medici* (1908); J. H. Mariéjol, *Catherine de Médicis* (1920); L. Romier, *Le Royaume de Catherine de Médicis, etc.* (1921); P. Van Dyke, *Catherine de Médicis* (1923).

CATHERINE OF ARAGON (1485-1536), queen of Henry VIII. of England, daughter of Ferdinand and Isabella of Spain, was born on Dec. 15, 1485. She left Spain in 1501 to marry Arthur, prince of Wales, eldest son of King Henry VII., and landed at Plymouth on Oct. 2. The wedding took place on Nov. 14 in London, and soon afterwards Catherine accompanied her husband to Wales, where, in his 16th year, the prince died on April 2, 1502. On June 25, 1503, she was formally betrothed to the king's second son, Henry, now prince of Wales, and a papal dispensation for the alliance was obtained. The marriage, however, did not take place during the lifetime of Henry VII. Ferdinand endeavoured to cheat the English king of the marriage portion agreed upon, and Henry made use of the presence of the unmarried princess in England to extort new conditions, and especially to urge the marriage of his daughter Mary to the archduke Charles, grandson of Ferdinand, and afterwards Charles V. Catherine was thus from the first the unhappy victim of state politics. Writing to Ferdinand on March 9, 1509, she describes the state of poverty to which she was reduced, and declares the king's unkindness impossible to be borne any longer.

Henry VIII. married her on June 11, 1509. At first he showed

himself an affectionate husband, and the alliance with Ferdinand was maintained against France. During Henry's invasion of France in 1513 she was made regent; she made the preparations for the Scottish expedition, and was riding north to put herself at the head of the troops when the victory of Flodden Field ended the campaign. After Henry's return next year there was a breach with Ferdinand, and the king angrily reproached his wife; but she took occasion in 1520, during the visit of her nephew Charles V. to England, to urge the policy of gaining his alliance rather than that of France. Immediately on his departure, on May 31, 1520, she accompanied the king to France, on the visit to Francis I., when the sovereigns met at the Field of the Cloth of Gold; but in 1522 war was declared against France and the emperor again welcomed to England. She is represented by Shakespeare as pleading in 1521 for the unfortunate duke of Buckingham. Between Jan. 1510 and Nov. 1518 Catherine gave birth to six children (including two princes), who were all stillborn or died in infancy except Mary, born in 1516, and opinion ascribed this series of disasters to the curse on incestuous unions. To avoid a fresh dispute concerning the succession, and the revival of the civil war, a male heir to the throne was a pressing necessity. The question of the possible dissolution of the marriage occupied Henry's mind. It was doubtful whether the pope had the power to legalize his marriage with Catherine, his brother's betrothed, and the case for the desired divorce was therefore more hopeful.

Rumours, probably then unfounded, of an intended divorce had been heard abroad as early as 1524. But the creation in 1525 of the king's illegitimate son Henry, as duke of Richmond—the title borne by his grandfather Henry VII.—and the precedence granted to him over all the peers as well as the princess Mary, together with the special honour paid at this time by the king to his own half-sister Mary, were the first real indications of the king's thoughts. In 1526, and perhaps earlier, Wolsey had been making tentative inquiries at Rome on the subject. In May 1527 a colusive and secret suit was begun before the cardinal, who, as legate, summoned the king to defend himself from the charge of cohabitation with his brother's wife; but these proceedings were dropped. On June 22 Henry informed Catherine that they had been living in mortal sin and must separate. During Wolsey's absence in July at Paris, where he had been commissioned to discuss vaguely the divorce and Henry's marriage with Renée, daughter of Louis XII., Anne Boleyn (*q.v.*) is first heard of in connection with the king, his affection for her having, however, begun probably as early as 1523, and the cardinal on his return found her openly installed at the court. In October 1528 the pope issued a commission to Cardinal Campeggio and Wolsey to try the cause in England, and bound himself not to revoke the case to Rome, confirming his promise by a secret decretal commission which, however, was destroyed by Campeggio. But the trial was a sham. Campeggio was forbidden to pronounce sentence without further reference to Rome, and was instructed to create delays, the pope assuring Charles V. at the same time that the case should be ultimately revoked to Rome.

The object of all parties was now to persuade Catherine to enter a nunnery and thus relieve them of further embarrassment. While Henry's envoys were encouraged at Rome in believing that he might then make another marriage, Henry himself gave Catherine assurances that no other union would be contemplated in her lifetime. But Catherine with courage and dignity held fast to her rights, demanded a proper trial, and appealed not only to the bull of dispensation, the validity of which was said to be vitiated by certain irregularities, but to a brief granted for the alliance by Pope Julius II. Henry declared the latter to be a forgery, and endeavoured unsuccessfully to procure a declaration of its falsity from the pope. The court of the legates accordingly opened on May 31, 1529, the queen appearing before it on June 18 for the purpose of denying its jurisdiction. On the 21st both Henry and Catherine presented themselves before the tribunal, when the queen threw herself at Henry's feet and appealed for the last time to his sense of honour, recalling her own virtue and helplessness. Henry replied with kindness, showing that her wish for the revocation of the cause to Rome was unreasonable in view of the

paramount influence then exercised by Charles V. on the pope. Catherine nevertheless persisted in making appeal to Rome, and then withdrew. After her departure Henry, according to Cavenish, Wolsey's biographer, praised her virtues to the court. "She is, my lords, as true, as obedient, as conformable a wife as I could in my phantasy wish or desire. She hath all the virtues and qualities that ought to be in a woman of her dignity or in any other of baser estate." On her refusal to return, her plea was overruled and she was adjudged contumacious, while the sittings of the court continued in her absence. Subsequently the legates paid her a private visit of advice, but were unable to move her from her resolution. Finally, however, in July 1529, the case was, according to her wish, and as the result of the treaty of Barcelona and the pope's complete surrender to Charles V., revoked by the pope to Rome: a momentous act, which decided Henry's future attitude, and occasioned the downfall of the whole papal authority in England. On March 7, 1530 Pope Clement issued a brief forbidding Henry to make a second marriage, and ordering the restitution of Catherine to her rights till the cause was determined; while at the same time he professed to the French ambassador, the bishop of Tarbes, his pleasure should the marriage with Anne Boleyn have been already made, if only it were not by his authority (Cal. of State Papers, For. and Dom. iv., 6290). The same year Henry obtained opinions favourable to the divorce from the English, French and most of the Italian universities, but unfavourable answers from Germany, while a large number of English peers and ecclesiastics, including Wolsey and Archbishop Warham, joined in a memorial to the pope in support of Henry's cause.

Meanwhile, Catherine was still treated by Henry as his queen. On May 31, 1531 she was visited by 30 privy councillors, who urged the trial of the case in England, but they met only with a firm refusal. On July 14 Henry left his wife at Windsor, removing himself to Woodstock, and never saw her again. In August she was ordered to reside at the Moor in Hertfordshire, and at the same time separated from the princess Mary, who was taken to Richmond. In October she again received a deputation of privy councillors, and again refused to withdraw the case from Rome. In 1532 she sent the king a gold cup as a new year's gift, which the latter returned, and she was forbidden to hold any communication with him. Her cause found champions and sympathizers among the people, among the court preachers, and in the House of Commons, while Bishop Fisher had openly taken her part in the legatine trial. Subsequently Catherine was removed to Bishops Hatfield, while Henry and Anne Boleyn visited Francis I. Their marriage, anticipating any sentence of the nullity of the union with Catherine, took place after their return about Jan. 25, 1533. On May 10 Archbishop Cranmer, opened his court, and declared on the 23rd the nullity of Catherine's marriage and the validity of Anne's. On Aug. 10 the king caused proclamation to be made forbidding her the style of queen; but Catherine refused to yield the title for that of princess-dowager. Not long afterwards she was removed to Buckden in Huntingdonshire. Here her household was considerably reduced, and she found herself hemmed in by spies, and in fact a prisoner. A project for removing Catherine from Buckden to Somersham, in the isle of Ely, with a still narrower maintenance, was prevented by her resistance. The attempt in November to incriminate the queen in connection with Elizabeth Barton failed.

She passed her life now in religious devotions. On March 23, 1534 the pope pronounced her marriage valid, but by this time England had thrown off the papal jurisdiction, the parliament had transferred Catherine's jointure to Anne Boleyn, and the decree had no effect on Catherine's fortunes. She refused to swear to the new act of succession, which declared her marriage null and Anne's infant the heir to the throne, and soon afterwards she was removed to Kimbolton, where she was well treated. On May 21 she was visited by the archbishop of York and Tunstall, bishop of Durham, who vainly threatened her with death if she persisted in her refusal. She was kept in strict seclusion, separated from Mary and from all outside communications, and in Dec. 1535 her health gave way. She died on Jan. 8, 1536, not without suspicions of poison, which, however, may be dismissed. She was buried by the

king's order in Peterborough cathedral. Before her death she dictated a last letter to Henry, according to Polydore Vergil, expressing her forgiveness, begging his good offices for Mary, and concluding with the astounding assurance—"I vow that mine eyes desire you above all things." The king himself affected no sorrow at her death, and thanked God there was now no fear of war.

Catherine is described as "rather ugly than otherwise; of low stature and rather stout; very good and very religious; speaks Spanish, French, Flemish, English; more beloved by the islanders than any queen that has ever reigned." She was a woman of considerable education and culture, her scholarship and knowledge of the Bible being noted by Erasmus, who dedicated to her his book on *Christian Matrimony* in 1526. She endured her bitter and undeserved misfortunes with extraordinary courage and resolution, and at the same time with great womanly forbearance, of which a striking instance was the compassion shown by her for the fallen Wolsey.

BIBLIOGRAPHY.—See the article in *Dict. of Nat. Biog.* by J. Gairdner, and those on Henry VIII. and Wolsey, where the case is summed up very adversely to Henry and J. A. Froude, *The Divorce of Catherine of Aragon* (1891) where it is regarded from the contrary aspect; *Cambridge Modern History*, vol. ii. (1903); A. F. Pollard, *Henry VIII.* (1905); M. Hume, *The Wives of Henry VIII.* (1905).

CATHERINE OF BRAGANZA (1638–1705), queen consort of Charles II. of England, daughter of John IV. of Portugal by Louisa de Gusman, daughter of the duke of Medina Sidonia, was born at Villa Viçosa on Nov. 25, 1638. She was a useful medium for contracting an alliance with England, and negotiations for a marriage, begun during the reign of Charles I., were renewed immediately after the Restoration. On June 23, 1661, in spite of Spanish opposition, the marriage contract was signed, by which England secured Tangier and Bombay, certain trading privileges, religious and commercial freedom in Portugal, and two million Portuguese crowns (about £300,000), in return for military and naval support to be given to Portugal against Spain, and liberty of worship for Catherine; in May 1662 she reached England, and the marriage took place in London. Catherine had little personal charm, and Charles's preoccupation with his mistresses soon led her to withdraw from his society; her intention of returning to Portugal was thwarted by the dismissal of her Portuguese retinue, and she was forced to pass a life of neglect and retirement in the midst of the debaucheries of the court. As the prospect of her bearing children diminished, schemes were set on foot to procure a divorce on various pretexts. As a Roman Catholic Catherine was attacked by the inventors of the Popish Plot; in 1678 the murder of Sir Edmund Berry Godfrey was ascribed to her servants, and Titus Oates accused her of a design to poison the king. On Nov. 28 Oates brought a charge of high treason against her, the Commons passed an address for her removal from Whitehall and it was only the king's protection that saved her from having to stand her trial in June 1679. On Nov. 17 in the House of Lords, Shaftesbury moved for a divorce, so that Charles might marry a Protestant, but the bill was opposed by the king. After the Oxford parliament Charles's influence revived, and the queen's position was no more assailed.

During Charles's last illness in 1685 Catherine did much to assist his reconciliation with the Catholic Church, and she exhibited great grief at his death. She afterwards resided at Somerset House and at Hammersmith, where she had privately founded a convent. She interceded with great generosity, but ineffectually, for Monmouth the same year. On June 10, 1688, she was present at the birth of the prince of Wales and gave evidence before the council in favour of the genuineness of the child. She maintained at first good terms with William and Mary; but the practice of her religion aroused jealousies, while her establishment at Somerset House was said to be the home of cabals against the Government; and in 1691 she settled for a short time at Euston. She left England finally in March 1692 and arrived at Lisbon in Jan. 1693. She took her residence at the palace of Bemposta, built by herself, near Lisbon. In 1703 she supported the Methuen Treaty, which cemented still further the alliance between Portugal and England, and in 1704 she was appointed regent of Portugal during the illness of her brother, King Pedro II., her administration

being distinguished by several successes gained over the Spaniards. She died on Dec. 31, 1705, bequeathing her great wealth, the result of long hoarding, after the payment of divers charitable legacies, to King Pedro; and was buried with great ceremony and splendour at Belem.

See L. C. Davidson, *Catherine of Braganza* (1908).

CATHERINE OF VALOIS (1401–1437), queen of Henry V. of England, daughter of Charles VI. of France by Isabel of Bavaria, was born in Paris on Oct. 27, 1401, and was educated in a convent at Poissy. After negotiations for a marriage between Henry, prince of Wales, afterwards Henry V., and each of her two elder sisters, had broken down, Henry IV. proposed that his son should marry Catherine in 1413, and Henry V. renewed this proposal when he became king in March of the same year, demanding at the same time a large dowry and the restoration of Normandy, and other territories in France. War broke out, on the rejection of these demands, but finally, after the treaty of Troyes, Henry and Catherine were betrothed on May 21, 1420, and married at Troyes, June 2, 1420. Catherine was crowned in Westminster Abbey on Feb. 23, 1421, and gave birth to a son, afterwards Henry VI., in the following December. In May 1422 she joined Henry in France, and after his death in the following August, she returned to England. Her name began to be coupled, now, with that of Owen Tudor, a Welsh squire, and when in 1428 Humphrey, duke of Gloucester, secured the passing of an act to prevent her from marrying without the consent of the king and council, she seems already to have been married to Tudor. In 1436 Tudor was imprisoned and Catherine retired to Bermondsey Abbey, where she died on Jan. 3, 1437. By Tudor Catherine had three sons and a daughter; the eldest son, Edmund, created earl of Richmond in 1452, was the father of Henry VII. (1877). See Agnes Strickland, *Lives of the Queens of England*, vol. iii.

CATHETUS, in architecture, the central circular form round which the volute or spiral of the Ionic or Composite order twists.

CATHODE, the conductor by which an electric current leaves an electrolyte (*q.v.*) or a discharge tube. It is also called the "negative" electrode. (See also ANODE; ELECTRICITY, CONDUCTION OF: *Liquids and Gases*; and ELECTROLYSIS.)

CATHODE RAYS are the streams of negatively charged particles leaving the cathode in a discharge tube containing a gas at a low pressure (see ELECTRICITY, CONDUCTION OF: *Gases*). The cathode rays consist of electrons (see ELECTRON). Cathode rays have many applications, one of the chief being the excitation of X-rays by the impinging of swift electrons against a hard anticathode (see also COOLIDGE TUBE; RÖNTGEN RAYS; and SPECTROSCOPY: *X-Ray*). This bombardment, besides exciting X-rays, generates a considerable amount of heat and the anticathode can be used as a *cathode ray furnace* for melting small quantities of metal, etc. Forms of apparatus making use of the deflection of a beam of cathode rays by magnetic and electric fields are the *cathode ray oscillograph*, or cathode ray tube, which indicates the variation and values of an alternating current or voltage (see INSTRUMENTS, ELECTRICAL), and the *cathode ray manometer*, in which a change of pressure is communicated to tourmaline crystals which become electrically charged (see ELECTRICITY) and produce an electric field which is measured by a cathode ray oscillograph (see BALLISTICS).

CATHOLIC, derived from a Greek word meaning "universal" and used by ecclesiastical writers since the 2nd century to distinguish the Church at large from local communities or heretical and schismatic sects. A notable exposition of the meaning of the term, as it had developed during the first three centuries, was given by Cyril of Jerusalem (348): the Church is called catholic on the fourfold ground of its world-wide extension, its doctrinal completeness, its adaptation to the needs of men of every kind, and its moral and spiritual perfection (*Catech.*, xviii., 23). The theory that what has been universally taught or practised is true was first fully developed by St. Augustine in his controversy with the Donatists (393–420), but it received classic expression in a paragraph of St. Vincent of Lerin's *Commonitorium*, ii., 6 (434), from which the well-known formula, *quod ubique, quod*

semper, quod ab omnibus creditum est, is derived. St. Vincent maintained—curiously enough *à propos* of an extreme Augustinian theory of grace—that the true faith was that which the Church professed throughout the world in agreement with antiquity and the consensus of distinguished theological opinion in former generations (*cf. op. cit.*, ii. 3, 6, xx.). Thus the term tended to acquire the sense of orthodox.

Some confusion in the history of the term has been inevitable as various groups, which have been condemned by Rome as heretical or schismatic, have not renounced their claim to the note of catholicity, so that in the modern world not only the Roman Catholic Church but also the Eastern Orthodox Church, the Anglican Church, and a variety of national Churches and minor sects claim to be Catholic, if not the only true Catholic Church. From this point of view the meaning attached to the term "Catholic" and the claim to catholicity will be conditioned by the theory of the nature and constitution of the Church accepted, being rigid and exclusive or tolerant and comprehensive as that is rigid or tolerant. The earlier theologians of the Anglican Church were primarily interested in proving the agreement of the Anglican theology with the teaching of the ante-Nicene Fathers, but with the Oxford Movement a school of theologians arose who interpreted the catholicism of the Church of England in a much wider sense. A product of this school was the so-called "Branch Theory" of the Church, which maintained that the Anglican, Roman, and Eastern Orthodox Churches were all branches of the one true Catholic Church, and that reunion could be achieved by concessions of these three divisions on controversial questions which divided them without affecting their catholic character. But this theory has been repeatedly condemned by Roman theologians, who are unable to overlook the Protestant character of historic Anglican theology, and who, since 1896, have, in agreement with the Bull of Pope Leo XIII., *Apostolicae Curae*, regarded Anglican orders as invalid and the Anglican Church, therefore, as no part of the true Catholic Church (*cf. the Encyclical of Pius XI., De vera religionis unitate fovenda*, Acta Apost. Sedis, Jan. 1928). It has also failed to recommend itself to the Eastern Orthodox Church.

CATHOLIC APOSTOLIC CHURCH, THE, a religious community often called "Irvingites," though neither actually founded nor anticipated by Edward Irving (*q.v.*). Irving's relation to this community was, according to its members, somewhat similar to that of John the Baptist to the early Christian Church, *i.e.* he was the forerunner and prophet of the coming dispensation, not the founder of a new sect; and indeed the only connection which Irving seems to have had with the existing organization of the Catholic Apostolic body was in "fostering spiritual persons who had been driven out of other congregations for the exercise of their spiritual gifts." Shortly after Irving's trial and deposition (1831), certain persons were, at some meetings held for prayer, designated as "called to be apostles of the Lord" by certain others claiming prophetic gifts. In the year 1835, six months after Irving's death, six others were similarly designated as "called" to complete the number of the "twelve," who were then formally "separated," by the pastors of the local congregations to which they belonged, to their higher office in the universal church on the 14th of July 1835. This separation is understood by the community not as "in any sense being a schism or separation from the one Catholic Church, but a separation to a special work of blessing and intercession on behalf of it." The "apostles" always held the supreme authority, though, as their number dwindled, "coadjutors" were appointed to assist the survivors, and to exercise the functions of the "apostolate." The last "apostle" died on the 3rd of February 1901.

For the service of the church a comprehensive book of liturgies and offices was provided by the "apostles." It dates from 1842 and is based on the Anglican, Roman and Greek liturgies. Lights, incense, vestments, holy water, chrism, and other adjuncts of worship are in constant use. The ceremonial in its completeness may be seen in the church in Gordon Square, London, and elsewhere. The community has always laid great stress on symbolism, and in the eucharist, while rejecting both transubstantiation and consubstantiation, holds strongly to a real (mystical) presence. It

stresses also the "phenomena" of Christian experience and deems miracle and mystery to be of the essence of a spirit-filled church.

Each congregation is presided over by its "angel" or bishop (who ranks as angel-pastor in the Universal Church); under him are four-and-twenty priests, and with these are the deacons, seven of whom regulate the temporal affairs of the church—besides whom there are also "sub-deacons, acolytes, singers, and door-keepers." The priesthood is supported by tithes; it being deemed a duty on the part of all members of the church who receive yearly incomes to offer a tithe of their increase every week, besides the free-will offering for the support of the place of worship, and for the relief of distress. Each local church sends "a tithe of its tithes" to the "Temple," by which the ministers of the Universal Church are supported and its administrative expenses defrayed; by these offerings, too, the needs of poorer churches are supplied.

See J. G. Simpson, art. "Irving and the Catholic Apostolic Church" in Hastings' *Encyclopaedia of Religion and Ethics*; and for further details of doctrines, ritual, etc., R. N. Bosworth, *Restoration of Apostles and Prophets, Readings on the Liturgy, The Church and Tabernacle, and The Purpose of God in Creation and Redemption* (6th ed., 1888); G. Miller, *History and Doctrines of Irvingism* (1878).

CATHOLIC EMANCIPATION, the movement for the abolition of the penal laws against Catholics. (See ENGLISH HISTORY; IRELAND; ROMAN CATHOLIC CHURCH.)

CATILINE (LUCIUS SERGIUS CATILINA) (c. 108–62 B.C.), a member of an ancient but impoverished patrician family of Rome. He was a supporter of Sulla, and during the proscription he was conspicuous for his greed and cruelty. He was guilty of at least one murder. In 77 he was a quaestor, in 68 praetor and in 67–66 governor of Africa. His impeachment for extortion having disqualified him as a candidate for the consulship, he formed a conspiracy, behind which, in all probability, were Crassus and Caesar. The new consuls were to be murdered on Jan. 1, but the plot—the execution of which was deferred till Feb. 5—failed. Soon after, Catiline was acquitted through bribery in the trial for extortion. His scheme was now widened. The city was to be fired, and those who opposed the revolution were to be slain; all debts were to be cancelled; and there was to be a proscription of all the wealthy citizens. Among the conspirators were many men of rank and influence. Arms and money were collected, soldiers were enlisted, and the assistance of the slaves was sought. Catiline intended to secure the consulship for 63 with C. Antonius as colleague, but Cicero secured first place, and Catiline was defeated. C. Antonius, in whom Catiline hoped to find a supporter, was won over by his colleague Cicero. Before the next *comitia consularia* assembled, the orator had given so impressive a warning of impending danger that Catiline was once more rejected (63), and the consuls were invested with absolute authority. Catiline now resolved upon open war; preparations were set on foot throughout Italy, especially in Etruria, where revolt was raised by C. Manlius (or Mallius), one of Sulla's veterans. A plan to murder Cicero in his own house on the morning of Nov. 7 was frustrated. On the next day Cicero attacked Catiline so vigorously in the senate (in his first Catilinarian oration) that he fled to his army in Etruria. Next day Cicero awoke the terror of the people by a second oration delivered in the forum, in consequence of which Catiline and Manlius were declared public enemies, and the consul Antonius was despatched with an army against them. Meanwhile the conspirators in the city tried to induce some Gallic envoys who happened to be in Rome to join them. The plot was betrayed to Cicero, at whose instigation documentary evidence was obtained, implicating Lentulus and others. They were arrested, proved guilty, and on Dec. 5 put to death in the underground dungeon on the slope of the Capitol. This act was afterwards attacked as a violation of the constitution, on the ground that the senate had no power of life and death over a Roman citizen. In the beginning of 62 Catiline saw his legions shut in between those of Metellus Celer and C. Antonius. Near Pistoria he was completely defeated by Antonius, and himself fell in the battle. It must not be forgotten that our authorities for this conspiracy were all members of the aristocratic party. Some of the incidents given as facts by Dio Cassius are absurdities; and Cicero paid more regard to the effect than to the truthfulness of an

accusation. We find him at one time seeking a political union with Catiline; at another, when his alliance had been rejected and an election was at hand, declaiming against him as a murderer and profligate. Lastly, though Sallust's vivid narrative is consistent throughout, it is obvious that he cherished very bitter feelings against the democratic party. Nevertheless, we cannot regard Catiline as an honest enemy of the oligarchy, or as a disinterested champion of the provincials. It is held by some historians that there was at the time on the part of many of the Roman nobles a determination to raise themselves to power, despite the opposition of the senate; others maintain that Catiline's object was simply the cancelling of his huge debts.

See E. S. Beesley, *Catiline, Clodius and Tiberius* (1878) in defence of Catiline; E. von Stern, *Catilina und die Parteikämpfe in Rom* 66–63 (1883), with bibliography in preface; C. Thiaucourt, *Étude sur la conjuration de Catiline* (1887), a critical examination of Sallust's account and of his object in writing it; J. E. Blondel, *Histoire économique de la conjuration de Catiline* (1893), written from the point of view of a political economist; Gaston Boissier, *La Conjuration de Catiline* (1905), and *Cicero and his Friends* (Eng. trans.); E. G. Hardy, "The Catilinarian Conspiracy—a re-study of the Evidence" (in *Journal of Roman Studies*, 1917); a good account in W. H. Heitland, *The Roman Republic* (1923); T. Rice Holmes, *The Roman Republic* ch. IV., and part II. pp. 446–473 (1923); Tyrrell and Purser's ed. of Cicero's *Letters* (index vol. s.v. "Sergius Catilina"). See also art. *ROME: History, The Republic*.

CATINAT, NICHOLAS (1637–1712), marshal of France, was born on Sept. 1, 1637, in Paris, entered the Gardes Françaises at an early age, and distinguished himself at the siege of Lille in 1667. He served with great credit in the campaigns of 1676–78 in Flanders, was employed against the Vaudois in 1686, and after taking part in the siege of Philipsburg at the opening of the War of the League of Augsburg, he was appointed to command the French troops in the south-eastern theatre of war. In 1690 he conquered Savoy, and in 1691 Nice; the battle of Staffarda, won by him over the duke of Savoy in 1690, and that of Marsaglia in 1693, were amongst the greatest victories of the time. In 1696 Catinat forced the duke to make an alliance with France. He had in 1693 been made a marshal of France. At the beginning of the War of the Spanish Succession, Catinat was placed in charge of operations in Italy, but he was much hampered by the orders of the court and the insufficiency of the forces for their task. He suffered a reverse at Carpi (1701) and was soon afterwards superseded by Villeroy, to whom he acted as second-in-command during the campaign of Chiari. He died at St. Gratien on Feb. 25, 1712.

See *Mémoires et Correspondance du Maréchal de Catinat*, ed. M.R. le Bouyer de St. Gervais (1819); E. de Broglie, *Catinat, l'homme et la vie, 1637–1712* (1902).

CATION, the constituent of an electrolyte (*q.v.*) which travels to the cathode (*q.v.*) in an electrolytic cell. (See also ANION; ELECTRICITY: *Historical Introduction*; ELECTRICITY, CONDUCTION OF: *Liquids*; and ELECTROLYSIS.)

CATKIN or **AMENTUM**, a pendulous spike of simple flowers separated by bracts, found in many trees, as, for example, willow and poplar. (See *FLOWER*.)

CATLETTSBURG, a residential city of north-eastern Kentucky, U.S.A., on the Ohio river, at the mouth of the Big Sandy, where Ohio, West Virginia and Kentucky meet; the county seat of Boyd county. It is on Federal highway 60 and the Chesapeake and Ohio railway. The population in 1920 was 4,183 (95% native white), and was 5,025 in 1930 by the Federal census. Catlettsburg has no manufactures of consequence, but is connected by electric car lines with the neighbouring industrial cities, Ashland, Kentucky, and Huntington, West Virginia.

CATLIN, GEORGE (1796–1872), American ethnologist, was born at Wilkes-Barre (Pa.), in 1796. He was educated as a lawyer and practised in Philadelphia for two years; but art was his favourite pursuit, and forsaking the law he established himself at New York as a portrait painter. In 1832, realizing that the American Indians were dying out, he resolved to rescue their types and customs from oblivion. With this object he spent many years among the Indians in North and South America. He lived with them, acquired their languages, and studied very thoroughly

their habits, customs and mode of life, making copious notes and many studies for paintings. In 1840 he came to Europe with his collection of paintings, most of which are now in the National museum, Washington, as the Catlin gallery; and in the following year he published the *Manners, Customs and Condition of the North American Indians* in two volumes, illustrated with 300 engravings. This was followed in 1844 by *The North American Portfolio*, containing 25 plates of hunting scenes and amusements in the Rocky mountains and the prairies of America, and in 1848 by *Eight Years' Travels and Residence in Europe*. In 1861 he published a curious little volume, in "manograph," entitled *The Breath of Life*, on the advantage of keeping one's mouth habitually closed, especially during sleep; and in 1868 *Last Rambles amongst the Indians of the Rocky Mountains and the Andes*. He died in Jersey city (N.J.), on Dec. 22, 1872.

See W. H. Miner, *George Catlin* with an annotated bibl. (1901); also *My Life Among the Indians* (ed. by N. G. Humphreys, 1909).

CATO, DIONYSIUS, the supposed author of the *Dionysii Catonis Disticha de Moribus ad Filium*. In the middle ages the author of the *Disticha* was supposed to be Cato the elder, who wrote a *Carmen de Moribus*, but extracts from this in Aulus Gellius show that it was in prose. Nothing is really known of the author or date of the *Disticha*; it can only be assigned to the 3rd or 4th century A.D. It is a small collection of moral apophthegms, monotheistic in character, not specially Christian. The book had a great reputation in the middle ages, and was translated into many languages; it is frequently referred to by Chaucer, and in 1483 a translation was issued from Caxton's press at Westminster.

See editions by F. Hauthal (1869), with full account of mss. and early editions, and G. Némethy (1895), with critical notes; Eng. trans. by Chase (Madison, 1922); see also F. Zarncke, *Der deutsche Cato* (1852), a history of middle age German translations; J. Nehab, *Der altenglische Cato* (1879); E. Bischoff, *Prolegomena zum sogenannten Dionysius Cato* (1893), in which the name is discussed; F. Plessis, *Poésie latine* (1909), 663; for mediaeval translations and editions see Teuffel, *Hist. of Roman Lit.* § 398, 3.

CATO, MARCUS PORCIUS (95-46 B.C.), Roman philosopher, called *Uticensis*. On the death of his parents he was brought up in the house of his uncle, M. Livius Drusus. After serving in the ranks against Spartacus (72 B.C.) he acted as military tribune (67) in Macedonia. On his return he became quaestor, and showed so much zeal and integrity in the management of the public accounts that he obtained a provincial appointment in Asia, where he strengthened his reputation. He admired the discipline which Lucullus had enforced in his own eastern command, and supported his claims to a triumph, while he opposed the pretensions of Pompey. As tribune in 62 he prosecuted L. Licinius Murena, consul-elect, for bribery. Cato supported Cicero at the time of the conspiracy of Catiline and voted for the execution of the conspirators, thus incurring the resentment of Julius Caesar, who did his utmost to save them.

Cato was now regarded as one of the leaders of the senatorial nobility. He vainly opposed Caesar's candidature for the consulship in 59, and his attempt, in conjunction with Bibulus, to prevent the passing of Caesar's agrarian law proved unsuccessful. Yet he was still an obstacle of sufficient importance for the triumvirs to desire to get rid of him. At the instigation of Caesar he was sent with a mission to settle the affairs of Cyprus (58). On his return two years later he continued to struggle against the combined powers of the triumvirs in the city, and became involved in scenes of violence and riot. He obtained the praetorship in 54, and endeavoured to suppress bribery, in which all parties were equally interested. He failed to attain the consulship, and had made up his mind to retire from public life when the civil war broke out in 49. He realized that the sole chance for the free state lay in supporting Pompey, whom he had formerly opposed. At the outset of the war he was entrusted with the defence of Sicily, but finding it impossible to hold the island he joined Pompey at Dyrrhachium. He was not present at the battle of Pharsalus, and after the battle, when Pompey abandoned his party, Cato led a small remnant of their forces into Africa. After his famous march through the Libyan deserts, he shut himself up

in Utica, and even after the decisive defeat at Thapsus (46), in spite of the wishes of his followers, he determined to keep the gates closed till he had sent off his adherents by sea. When the last of the transports had left the port he cheerfully dismissed his attendants, and soon afterwards stabbed himself.

He had been reading, we are told, in his last moments Plato's dialogue on the immortality of the soul, but his own philosophy had taught him to act upon a narrow sense of immediate duty without regard to the future. He conceived that he was placed in the world to play an active part, and when disabled from carrying out his principles, to retire gravely from it. He had lived for the free state, and it now seemed his duty to perish with it. In politics he was a typical doctrinaire, blind to the fact that his national ideal was an anachronism. The only composition by him which we possess is a letter to Cicero (*Ad. Fam.* xv. 5). The school of the Stoics, which took a leading part in the history of Rome under the earlier emperors, looked to him as its saint and patron. Immediately after his death Cato's character became the subject of discussion; Cicero's panegyric *Cato* was answered by Caesar in his *Anticato*. Brutus, dissatisfied with Cicero's work, produced another on the same subject; in Lucan Cato is represented as a model of virtue and disinterestedness.

See his *Life* by Plutarch; also C. W. Oman, *Seven Roman Statesmen of the Later Republic*, Cato . . . (1902); Mommsen, *Hist. of Rome* (Eng. trans.), bk. v. ch. v.; Gaston Boissier, *Cicero and his Friends* (Eng. trans., 1897); esp. pp. 277 foll.; Warde Fowler, *Social Life at Rome* (1909).

CATO, MARCUS PORCIUS (234-149 B.C.), Roman statesman, surnamed "The Censor" or "The Elder," was born at Tusculum of an ancient plebeian family. He was bred to agriculture, but, having attracted the notice of L. Valerius Flaccus, he was brought to Rome, and became successively quaestor (204), aedile (199), praetor (198), and consul (195). During his term of office he vainly opposed the repeal of the Lex Appia, to restrict extravagance on the part of women. Meanwhile he served in Africa, and took part in the campaign of Zama (202). He held a command in Sardinia and again in Spain, which he subdued with great cruelty, thereby gaining a triumph (194). In the year 191 he acted as military tribune in the war against Antiochus III. of Syria. If he was not personally engaged in the prosecution of the Scipios (Africanus and Asiaticus) for corruption, it was his spirit that animated the attack upon them. Cato's enmity dated from the African campaign when he quarrelled with Scipio for his lavish distribution of the spoil amongst the troops, and his general luxury and extravagance.

Cato opposed the spread of the new Hellenic culture which threatened to destroy ancient Roman simplicity. His purpose was shown most clearly in the discharge of the censorship; hence his title of "Censor." He revised with unsparing severity the lists of senators and knights, ejecting the men whom he judged unworthy, either on moral grounds or from want of means. The expulsion of L. Quinctius Flamininus for cruelty was an example of his rigid justice. His regulations against luxury were very stringent, and he supported the Lex Orchia (181) and Lex Voconia (169). He repaired the aqueducts, cleansed the sewers, prevented private persons drawing off public water for their own use, ordered the demolition of houses which encroached on the public way, and built the first basilica in the forum near the curia. He raised the amount paid by the publican for the right of farming the taxes, and at the same time diminished the contract prices for the construction of public works.

From the date of his censorship (184) to his death in 149, Cato held no public office, but continued to distinguish himself in the senate as the persistent opponent of the new ideas. Like many others he was shocked at the licence of the Bacchanalian mysteries; and he urged the dismissal of the philosophers (Carneades, Diogenes and Critolaus), who came as ambassadors from Athens, on account of the dangerous nature of their views. Almost his last public act was to urge his countrymen to the Third Punic War and the destruction of Carthage. In 157 he was one of the deputies sent to arbitrate between Carthage and Numidia and was so struck by Carthaginian prosperity that he was convinced that the security of Rome depended on the annihilation of Carthage.

From this time, in season and out of season, he kept repeating the cry: "Delenda est Carthago" ("Carthage must be destroyed").

Cato regarded the family as the germ of the State, and proved himself a hard husband, a strict father, a severe and cruel master. There was little difference apparently, in the esteem in which he held his wife and his slaves; his pride alone induced him to take a warmer interest in his sons. The Romans respected this behaviour as a traditional example of the old Roman manners (Livy xxxix. 40).

Cato was the first Latin prose writer of any importance, and the first author of a history of Rome in Latin. His treatise on agriculture (*De Agricultura* or *De Re Rustica*) is the only work by him that has been preserved. It contains a miscellaneous collection of rules of good husbandry, conveying much curious information on the domestic habits of the Romans of his age. His most important work *Origines*, in seven books, related the history of Rome from its earliest foundations to his own day. His speeches, of which 150 were collected, were chiefly directed against the young nobles of the day. He also wrote a set of maxims for the use of his son (*Praecepta ad Filium*) and some rules for everyday life in verse (*Carmen de Moribus*). The collection of proverbs in hexameter verse, extant under the name of Cato, probably belongs to the 4th century A.D. (See CATO, DIONYSIUS.)

BIBLIOGRAPHY.—There are lives of Cato by Cornelius Nepos, Plutarch and Aurelius Victor, and many particulars of his career and character are to be gathered from Livy and Cicero. See also G. Kurth *Caton l'ancien* (Bruges, 1872); F. Marcucci *Studio critico sulle Opere di Catone il Maggiore* (1902). The best edition of the *De Agricultura* is by H. Keil (1884-91), of the fragments of the *Origines* by H. Peter (1883) in *Historicorum Romanorum Fragmenta*, of the fragments generally by H. Jordan (1860); see also J. Wordsworth *Fragmenta and Specimens of Early Latin* (1874); Mommsen *Hist. of Rome* (Eng. trans.) bk. iii. ch. xi. and xiv.; Warde Fowler *Social Life at Rome* (1909).

CATO, PUBLIUS VALERIUS, Roman poet and grammarian, was born about 100 B.C. He was the leader of the "new" school of poetry (*poetae novi*, as Cicero calls them). Its followers rejected the national epic and drama in favour of the artificial mythological epics and elegies of the Alexandrian school. The great influence of Cato is attested by the lines:—

Cato grammaticus, Latina Siren
Qui solus legit ac facit poetas.¹

Our information regarding his life is derived from Suetonius (*De Grammaticis*, 11). He was a native of Cisalpine Gaul, and lost his property during the Sullan disturbances before he had attained his majority. He lived to a great age and during the latter part of his life was very poor. In addition to grammatical treatises, Cato wrote a number of poems, the best known of which were the *Lydia* and *Diana*. In the *Indignatio* (perhaps a short poem) he defended himself against the accusation that he was of servile birth. It is probable that he is the Cato mentioned as a critic of Lucilius in the lines by an unknown author prefixed to Horace, *Satires*, i. 10.

Among the minor poems attributed to Virgil is one called *Dirae* (or rather two, *Dirae* and *Lydia*). The *Dirae* consists of imprecations against the estate of which the writer has been deprived, and where he is obliged to leave his beloved Lydia; in the *Lydia*, on the other hand, the estate is envied as the possessor of his charmer. Joseph Justus Scaliger was the first to attribute the poem (divided into two by F. Jacobs) to Valerius Cato, on the ground that he had lost an estate and had written a *Lydia*. The balance of opinion is in favour of the *Dirae* being assigned to the beginning of the Augustan age, although O. Ribbeck supports the claims of Cato to the authorship. The best edition of these poems is by A. F. Nägele (1847), with exhaustive commentary and excursuses; a clear account of the question will be found in M. Schanz's *Geschichte der römischen Literatur*; for the "new" school of poetry see Mommsen, *Hist. of Rome*, bk. v. ch. xii.; F. Plessis, *Poésie latine* (1909), 188.

CATS, JAKOB (1577-1660), Dutch poet and humorist, was born at Brouwershaven in Zeeland. He studied law at Leyden and at Orleans, and, returning to Holland, settled at The Hague, where he began to practise as an advocate. His pleading in defence of a wretched creature accused of witchcraft brought him many clients and some reputation. He had a serious love affair

¹"Cato, the grammarian, the Latin siren, who alone reads aloud the works and makes the reputation of poets."

about this time, which was broken off on the very eve of marriage by his catching a tertian fever which defied all attempts at cure for some two years. For medical advice and change of air Cats went to England, where he consulted the highest authorities in vain. He returned to Zeeland to die, but was cured mysteriously by a strolling quack. He married in 1602 a lady of some property, Elisabeth von Valkenburg, and thenceforward lived at Grypskerke in Zeeland, where he devoted himself to farming and poetry. His best works are: *Emblemata* or *Minnebeelden* with *Maegdenplicht* (1618); *Spiegel van den ouden en nieuwen Tijd* (1627); *Houwelyck . . .* (1625); *Selfstrijt* (1620); *Ouderdom en Buytenleven op. Zorgh-Vliet* (1655); and *Gedachten op. slapeloze nachten* (1661). In 1621, on the expiration of the 12 years' truce with Spain, the breaking of the dykes drove him from his farm. He was made pensionary (stipendiary magistrate) of Middelburg; and two years afterwards of Dort. In 1627 Cats came to England on a mission to Charles I., who made him a knight. In 1636 he was made grand pensionary of Holland, and in 1648 keeper of the great seal; in 1651 he resigned his offices, but in 1657 he was sent a second time to England on what proved to be an unsuccessful mission to Cromwell. In the seclusion of his villa of Sorgvliet, near The Hague, he lived from this time till his death, occupied in the composition of his autobiography (*Eighty-two Years of My Life*, first printed at Leyden in 1734) and of his poems. He is still spoken of as "Father Cats" by his countrymen.

Cats was contemporary with Hooft and Vondel and other distinguished Dutch writers in the golden age of Dutch literature, but his Orangist and Calvinistic opinions separated him from the liberal school of Amsterdam poets. He was intimate with Constantijn Huygens, whose political opinions were more nearly in agreement with his own. For an estimate of his poetry see DUTCH LITERATURE. Hardly known outside Holland, among his own people for nearly two centuries he enjoyed an enormous popularity.

See G. Derudder, *Un poète néerlandais: Cats, sa vie, son oeuvre* (Calais, 1898); G. Kalff, *Jakob Cats* (1902).

CATS AND DOGS, a term used in the U.S.A. to apply to securities of a highly speculative character, having uncertain value or no value at all. They are often securities of undeveloped schemes and offer fields for speculation of the wildest type. They are constantly "unloaded" in large quantities by unscrupulous dealers or by promoters upon gullible buyers.

CAT'S-EYE, a name given to several distinct minerals, their common characteristic being that when cut with a convex surface they display a luminous band, like that seen by reflection in the eye of a cat. (1) Precious, oriental or chrysoberyl cat's-eye. This, the rarest of all, is a chatoyant variety of chrysoberyl (*q.v.*), showing in the finest stones a very sharply defined line of light. (2) Quartz cat's-eye. This is the common form of cat's-eye, in which the effect is due to the inclusion of parallel fibres of asbestos. It is obtained chiefly from Ceylon, but, though coming from the East, it is often called "occidental cat's-eye"—a term intended simply to distinguish it from the finer oriental stone. It is readily distinguished by its inferior density, its specific gravity being only 2.65, while that of oriental cat's-eye is as high as 3.7. A greenish fibrous quartz, cut as cat's-eye, occurs at Hof and some other localities in Bavaria. (3) Crocidolite cat's-eye, a beautiful golden brown mineral, with silky fibres, found in Griqualand West, and much used in recent years as an ornamental stone, sometimes under the name of "South African cat's-eye." It consists of fibrous quartz, coloured with oxide of iron, and results from the alteration of crocidolite (*q.v.*). (4) Corundum cat's-eye. In some asteriated corundum (see ASTERIA) the star is imperfect and may be reduced to a luminous zone, producing an indistinct cat's-eye effect. (F. W. R.)

CATSKILL, a village of New York, U.S.A., on the west bank of the Hudson river, 35m. S. of Albany; the county seat of Greene county. It is on Federal highway 9W, and is served by the West Shore railroad and by river steamers. A ferry connects it with the New York Central railroad at Greendale. The population in 1930 (Federal census) was 5,082. Catskill is itself a summer resort, and is the gateway to the Catskill Mountain

region. Near by is the spot where Rip Van Winkle had his fabled sleep of 20 years. At Leeds, on the Mohican Trail just north-west of the village, is a beautiful stone arch bridge of the 18th century. The first settler here was Derrick Teunis van Vechten, in 1680. The village was incorporated in 1806.

CATSKILL MOUNTAINS, a group of moderate elevation pertaining to the Allegheny plateau and not included in the Appalachian system because they lack the internal structure and general parallelism of topographic features which characterize the Appalachian ranges. They are situated mainly in Greene and Ulster counties in the state of New York, with minor sections extending into Delaware and Schoharie counties. The Catskills rise to about the general height of the Highlands of Scotland or the Harz mountains of Germany, the group containing many summits above 3,000 ft. elevation and half a dozen approaching 4,000, Slide Mountain (4,204 ft.) and Hunter Mountain (4,025 ft.) being the only ones exceeding that figure.

The Catskills were not subject to the general folding which marked the elevation of the main ridges of the Appalachians. This gives the mountains the features of a carved plateau with scenery of a subdued type. There are, however, a number of rugged precipices on their outer faces and a number of deeply worn gorges called "cloves." Stony clove and Kaaterskill clove are picturesque gorges, the latter containing three cascades having a total fall of about 300 feet. The Devassego falls of the Schoharie are also strikingly picturesque. Some of the views which have become noted for their magnificent panorama are Pine Orchard ledge, where there is an unobstructed view of the mountain region of Massachusetts, Vermont, and New Hampshire; Kaaterskill Knob, North Mountain outlook, Sunset rock, Prospect rock, and others. The mountains are, as a whole, well wooded quite up to their summits—pine, spruce, oak, hickory, beech, maple, rhododendron, and mountain laurel being common. The almost total absence of lakes is remarkable.

The pure and cool atmosphere attracts a multitude of summer visitors, for whose accommodation many hotels and cottages have been built. Access to all parts of the mountains is made possible by a railway and numerous motor highways. The growing use of the region for a vacation ground has led the state of New York to acquire a forest reserve, which in 1927 amounted to over 155,000 acres. The Catskill reservoirs are the principal source of New York city's water supply.

CATT, CARRIE CHAPMAN (1859—), American suffragist leader, was born at Ripon, Wis., on Jan. 9, 1859. She was educated at the State college of Iowa and took a special course in law. She then became the high school and general superintendent of schools at Mason City, Iowa. In 1890 she enlisted in the cause of woman suffrage, in furtherance of which she lectured throughout the United States and in Europe. She held the office of president of the National American Woman Suffrage Association from 1900 to 1904 and from 1915 until the close of the campaign which resulted in the passing of the woman-suffrage amendment (1920) to the U.S. Constitution. She organized and was president of the International Woman Suffrage Alliance from 1904 to 1923. After the enfranchisement of women she devoted herself to the cause of peace and served as chairman of a national committee on the cause and cure of war, which represented nine women's organizations of the United States. She wrote *Woman Suffrage and Politics*.

CATTANEO, CARLO (1801-1869), Italian philosopher and republican, was the founder of the review *Il Politecnico*. He was the heart and soul of the Five Days of Milan (March 18-22, 1848), and bitterly opposed the hegemony of Piedmont in Italy. On the return of the Austrians he fled to Lugano, and there he wrote his *Storia della Rivoluzione del 1848* and the *Archivio triennale delle cose d'Italia* (3 vols., 1850-55). An uncompromising opponent of Cavour, he steadfastly refused to stand for election to the Italian parliament owing to his inability to take the oath of allegiance to the monarchy.

See his *Opere edite ed inedite* (7 vols., ed. by A. Bertani, Florence 1881-92), *Scritti politici ed epistolari* (ed. by G. Rosa and J. W. Mario, Florence, 1892), and *Scritti storici, letterari, etc.* (ed. by C. Romussi,

Milan, 1898). See also A. and J. Mario, *Carlo Cattaneo* (Florence, 1884); E. Zanoni, *Carlo Cattaneo nella vita e nelle opere* (1898); G. Nollé, *La Filosofia di Carlo Cattaneo* (Crema, 1901); G. Salvemini, *Le più belle pagine di Carlo Cattaneo* (Milan, 1922).

CATTANEO, DANESE DI MICHELE (1509-1573), Italian sculptor, born at Colonnata, near Carrara, pupil of Jacopo Sansovino in Rome. It is said he was taken prisoner three times by the Imperialists during the "Sacco di Roma" in 1527. He fled to Florence, where he carved the marble bust of Alessandro de' Medici; and then joined Sansovino in Venice. He was employed by his master on sculptures for the Libreria di San Marco and the Zecca. Among his works in Venice are the "Apollo" crowning the fountain in the Zecca; the "St. Jerome" in San Salvatore, the figures on the tombs of Leon Loredano in SS. Giovanni e Paolo, and of Andrea Badoer in the Scuola di S. Giovanni Battista. He also worked in Padua for the church of Sant' Antonio. The fine bust of Cardinal Pietro Bembo (1547) placed on the tomb in that church is by his hand. At Verona he built the tomb of Gian Fregoso in S. Anastasia with the help of his distinguished pupil Gerol. Campagna. He returned to Padua in 1572, but death cut short his work on the reliefs for the Capella del Santo, which were completed by Campagna. Cattaneo was also a poet; his poems *Gli Amori di Marfisa* (1562) were praised by Torquato Tasso. His writings were collected by his grandson Niccolo.

CATTARO (Serbo-Croatian *Kotor*), a seaport of Montenegro, Yugoslavia. Pop. (1921) 2,739. The town, which is Venetian in appearance, occupies a ledge between the Montenegrin mountains and the Bocche di Cattaro, a beautiful inlet of the Adriatic, which expands into five broad gulfs united by narrower channels, and forms one of the finest natural harbours in the world. If railway communication were established with the interior Cattaro might be made a big naval base and shipping centre. Cattaro is strongly fortified; on the seaward side Castelnovo (Serbo-Croatian, *Erceg-novi*) guards the main entrance to the Bocche; on the landward side, long walls run from the town to the castle of San Giovanni, far above, while the barren heights of the Krivosie, towards Montenegro, are crowned by small forts.

Cattaro is divided almost equally between the Roman Catholic and the Orthodox creeds. It is the seat of a Roman Catholic bishop with a Cathedral containing some beautiful marble sculptures, a collegiate church and several convents. There is a secondary school, a naval college, an interesting naval museum, and a forest school. Cattaro is famous for its lace-making, and also does an extensive trade in cheese. Foreign visitors to Montenegro usually land at Cattaro, and go by motor diligence to Cetinje. Castelnovo is a picturesque town which rose round the citadel built in 1377 by a Bosnian king. It has at various times been occupied by Turks, Venetians, Spaniards, Russians, French, English and Austrians. The Orthodox convent of St. Sava, standing amid beautiful gardens, was founded in the 16th century and contains many fine specimens of 17th century silversmiths' work.

Rhizon, the modern port of Risano, from which a track leads into Montenegro, was a thriving "Illyrian" city as early as 229 B.C., and gave its name to the Bocche, then known as Rhizonicus Sinus. Rhizon submitted to Rome in 168 B.C. and about the same time Ascrivium, or Ascruvium, the modern Cattaro, is first mentioned as a neighbouring city. Justinian built a fortress above Ascrivium in A.D. 535, after expelling the Goths, and a second town probably grew up on the heights round it. The city was plundered by the Saracens in 840 and by the Bulgarians in 1102. In the next year it was ceded to Serbia by the Hungarian tsar Samuel, but revolted, and only submitted in 1184 as a protected state. It was already an episcopal see, and in the 13th century Dominican and Franciscan monasteries were established to check the spread of Bogomilism. In the 14th century it was one of the capitals of the Serbian state of Dioklitiya, and Stephen Dushan (1331-55) had his mint here, while its commerce, rivalling that of Ragusa, provoked the jealousy of Venice. After the downfall of Serbia in 1389, it was seized and abandoned by Venice and Hungary in turn, and finally passed under Venetian rule in 1420. It was besieged by the Turks in 1538 and 1657, visited by plague in 1572, and nearly destroyed by earthquakes in 1563 and 1667. In

1707 it passed to Austria; in 1805 it was assigned to Italy; in 1806 the Russians occupied it and Napoleon, to whom it had been ceded, took Ragusa in its stead. From 1807-13 it was united to the French empire; in the latter year, the Montenegrins aided by the British fleet held it for 5 months, and in 1814 it was restored by the Congress of Vienna to Austria, with whom it remained until 1918. During the World War the Montenegrins arrived before Cattaro, which was a centre of submarine activity. The Slav sailors mutinied in 1918, but the Italians, refusing aid, many of them were shot or imprisoned.

See G. Gelcich (Gelčić) *Memorie storiche sulle Bocche di Cattaro* (Zara, 1880).

CATTEGAT or **KATTEGAT** (Scand. "cat's-throat"), a strait forming part of the connection between the Baltic and the North Seas. It lies north and south between Sweden and Denmark, and connects north with the Skagerrack and south through the Sound. Great Belt and Little Belt with the Baltic Sea. Length about 150 m., extreme breadth about 88 m., area 9,840 sq.m., mean depth not more than about 14 fathoms. (See **BALTIC**.)

CATTELL, JAMES MCKEEN (1860-), American psychologist and editor, was born at Easton, Pa., on May 25, 1860. He graduated at Lafayette college in 1880, and took his degree at Leipzig in 1886. After having been lecturer at the University of Pennsylvania, Bryn Mawr college and the University of Cambridge, he was from 1888 to 1891 professor of psychology at the University of Pennsylvania, this having been the first professorship of psychology in any university.

From 1891 to 1917 he was professor at Columbia university, and later president of the psychological corporation. He was editor of the *Psychological Review* from 1895 to 1905, and was editor from 1894 of *Science*, from 1900 of the *Popular Science Monthly* and the *Scientific Monthly*, from 1907 of the *American Naturalist* and from 1915 of *School and Society*. He wrote research works on psychological measurements, individual differences, applications of psychology, and was the author of many publications on psychology, scientific organization and education. He was president of the first American International Congress of Psychology.

CATTERMOLE, GEORGE (1800-1868), English painter, chiefly in water-colours, was born at Dickleburgh, near Diss, Norfolk, in August 1800. At the age of 16 he began working as an architectural and topographical draughtsman. Cattermole was a painter of no inconsiderable gifts, of great facility in picturesque resource, and also a book illustrator. At the Paris exhibition of 1855 he received one of the five first-class gold medals awarded to British painters. He also enjoyed professional honours in Amsterdam and in Belgium. He died on July 24, 1868. Among his leading works are "The Murder of the Bishop of Liège" (15th century), "The Armourer relating the Story of the Sword," "The Assassination of the Regent Murray by Hamilton of Bothwellhaugh," and (in oil) "A Terrible Secret."

CATTLE. The word cattle was formerly used to embrace all farm live stock, but is now commonly restricted to oxen or neat cattle. The several animals that may be included under the term, in this narrower sense, are usually divided into the following six groups:—(1) Buffaloes (India, Africa, etc.); (2) Bison (Europe and North America); (3) the Yak (Thibet, etc.); (4) the Gaur, Gayal and Bantin (India and Further India); (5) Eastern and African domesticated cattle or Zebu; and (6) Western or European domesticated cattle. Apart from the two last mentioned groups the India buffalo, yak, gayal and bantin have been domesticated, and the American bison is being tried as an economic animal. Apart from the buffaloes, which constitute a relatively primitive and rather distinct type, all the species enumerated are rather closely related. The buffaloes do not hybridize with the members of the other groups, but all the rest can be interbred without difficulty and the hybrids, or at least the female hybrids, are quite fertile. (See also **BOVIDAE**, **BUFFALO**, **BISON**, **YAK**, **GAUR**, **GAYAL**, **BANTIN**, **OX**, **AUROCHS**.)

The ox was certainly one of the earliest—possibly the first—of all animals to be domesticated. As regards Western Europe there is no evidence of domestication in paleolithic times but there are

plentiful remains in the Swiss lake dwellings and other deposits of neolithic age. Domesticated cattle existed in Egypt about 3500 B.C., and possibly much earlier, while Babylonian remains have been assigned to still more remote ages.

In all likelihood the wild ancestors of European domesticated cattle belonged to one or more of the sub-species of the aurochs or urus (*Bos primigenius*) which was widely distributed in Europe, Western Asia, and Northern Africa in prehistoric times. However, the earliest known domesticated ox in Europe was a very small, slenderly built animal, with short horns, bearing all the marks of a prolonged existence under the care of man and contrasting very markedly with the contemporary wild urus. The conclusion has been drawn that the original domestication did not occur in Western Europe; probably the little ox, (*Bos longifrons* or *Bos brachyceros*) together with corresponding types of sheep and pig were brought from Asia by neolithic man in his migrations. Later, in the Bronze age particularly, a new and larger type of cattle, showing a closer resemblance to the European wild ox, made its appearance. Probably the *Bos longifrons* had been "graded up" by crossing with the wild type. The process was, however, not universal, and even to-day breeds like the Shetland, Jersey, Kerry and Brown Swiss show a marked resemblance to the neolithic type.

Whether the zebu had a separate origin from the western ox is not known; some authorities seek to relate it with the bantian or gayal. In shape, colour, habits, and even in voice, it presents many points of difference from western cattle; but the most striking of these, such as the presence of a hump, or the upward inclination of the horns, are not constant. There exist in Africa, Spain, China, etc., breeds which are intermediate between zebu and European cattle, but it is likely that some at least of these have arisen by crossing. (J. A. S. W.)

CATTLE-BREEDING. The word "cattle," which etymologically merely denotes a form of property and is practically synonymous with "chattel," is by common usage a generic term for animals of the bovine race. The history of domesticated cattle begins with the history of civilisation; indeed, before the days of settled communities nomadic man possessed herds of cattle which represented his wealth. With the beginning of agriculture and the systematic cultivation of the land the ox was harnessed to the plough and it is still the draught animal of the farm throughout the greater part of the world. Even in England it has been displaced by the horse only within the past century and there are many persons still living who have seen oxen ploughing English land. The economic value of cattle arose from the docility of the males for draught and the aptitude of the females to supply milk in excess of the requirements of their offspring. Ultimately they were utilized as food but this was in a sense secondary, and among some races their flesh was regarded for religious or other reasons as unfit for human consumption. The breeding and rearing of cattle for the primary purpose of supplying meat is a modern development.

In the terminology used to describe the sex and age of cattle, the male is first a "bull-calf" and if left intact becomes a "bull"; but if castrated he becomes a "steer" and in about two or three years grows to an "ox." The female is first a "heifer-calf," growing into a "heifer" and becoming after two or three years a "cow." A heifer is sometimes operated on to prevent breeding and is then a "spayed heifer." The age at which a steer becomes an ox and a heifer a cow is not clearly defined and the practice varies. Both in the male and female emasculation is practised because the animals are assumed to fatten more readily; in the case of bulls intended for use as working oxen the object of emasculation, as in the case of stallions, is to make them quieter and more tractable in work.

Breeds.—The exact definition of a "breed" of cattle is difficult, although the term is commonly used and in practice well understood. It may be said generally to connote a particular type of animal which has for a long period been bred only with those of the same, or closely similar type, and has hereditary characteristics which are transmissible to its offspring. In every breed, however long established, instances of atavism may and do occur, but these are eliminated and do not affect its general purity. Breeds have

been established by generations of cattle-breeders aiming at the attainment and preservation of a particular type and working on the principle that "like begets like." It is only within very recent times that the laws of heredity founded on the researches of Mendel have been studied as a science. There are many old-established breeds on the Continent as for example the Charolais and Normande of France, the Holsteins of Holland, the Campagna di Roma of Spain, and many others, but the British breeds are of most interest because of their influence in building up the vast herds which furnish the supplies of beef on which other countries are largely dependent. (*See BEEF*).

There are in the British Isles 20 breeds recognized by separate classes at the annual show of the Royal Agricultural Society. They are the following:

| | |
|------------------|-----------------------------|
| Aberdeen Angus | Jersey |
| Ayrshire | Kerry |
| Belted Galloway | Lincolnshire Red Shorthorns |
| Blue Albion | Longhorn |
| British Friesian | Park |
| Devon | Red Poll |
| Dexter | Shorthorn |
| Galloway | South Devon |
| Guernsey | Sussex |
| Hereford | Welsh |

To this list should be added the Highland breed for which classes are provided at the annual show of the Highland and Agricultural Society of Scotland. Some of these breeds are limited in number and restricted in locality but each has its own characteristic merits as may be seen by noting the salient features of the more important of them.

The Shorthorn.—The Shorthorn affords the most notable instance of the "making" of a breed by a few enterprising and skilful breeders. In the last quarter of the 18th century two brothers, Charles and Robert Colling, farming in Durham, started to improve the local cattle of the Teeswater district of that county. From the place of its origin the Shorthorn is commonly known as the "Durham" in countries to which animals of the breed have been exported. By careful selection and breeding they gradually improved the type and their efforts were supplemented by other enlightened breeders, notably by Thomas Booth and Thomas Bates in Yorkshire. These two enterprising men each had his own conception of the precise lines on which the breed should be developed and for many years there was keen rivalry between those who preferred the "Bates strain" and those who favoured the "Booth strain." During the middle of the 19th century there was a Shorthorn "boom" which reached extravagant heights. The craze for particular strains and "families" led to excessive in-breeding and the general excellence of the breed was endangered by insistence on "fancy" rather than on practical points. The culmination of what may be termed the Bates and Booth period came in 1875 and thereafter there was a reaction from the tendency to rely on one or two "fashionable" strains, and a reversion to the more utilitarian principles of the founders of the breed. Breeders such as the Cruickshanks and later W. Duthie in Scotland and J. Deane Willis in England restored the constitutional vigour of the breed, which had been temporarily impaired by excessive in-breeding.

The most distinctive characteristic of the breed is its adaptability. It will thrive under diverse conditions of soil, climate and situation. A modern writer puts this forcibly: "To suit pasturage that is very productive a large beast can be secured; on the other hand medium, or even small cattle can always be produced from Shorthorns when required. In a harsh climate the breed can be relied upon to grow an abundance of soft, warm, weather-defying coat; in more favoured climates this faculty is not brought into play. Given plenty of food to force growth, well-bred stock may be relied on for very early maturity; on the other hand, when "done" only moderately well, the animal will gradually and slowly mature. No other breed can show such adaptability." Shorthorn bulls have also a high reputation for "prepotency," *i.e.*, the faculty of impressing their qualities on their offspring. This is one reason why they are in such widespread demand for improving native stock in all parts of the world. Geographically, Shorthorns are

more widely distributed than any other breed. To quote an American writer: "It is generally found in North America; in South America, more particularly in Argentina; in Europe, being the most prominent breed in the British Isles, although bred to some extent on the Continent; in Australia, where it has long met with favour, and to some extent in South Africa and Asia. In the United States the Shorthorn is the most popular breed. However, on the western range, under severe winter conditions, and where "roughing it" is required, the Shorthorn will not thrive quite equal to the Hereford or Galloway." The Shorthorn Herd-book (the first of its kind) was started in 1822 by George Coates and was published as a private compilation until 1876 when it was taken over by the Shorthorn Society. The American Shorthorn Herd-book was first published in 1846. The Canadian Shorthorn Herd-book was started in 1867. Over 600,000 Shorthorns are registered in the United States and several thousands in Canada.

Dairy Shorthorns are an offshoot of the breed in which its milking qualities have been specially developed, and *Lincolnshire Red Shorthorns* are a specialised type of the original stock.

The Hereford.—The temporary decadence of the Shorthorns referred to above, gave an opportunity to the *Hereford* breed to become established on the ranches of America. Its strong constitution and thick coat of hair make it specially suited to stand exposure and to thrive under conditions of hardship.

The origin of the breed is obscure but there are good grounds for the claim that it is directly descended from the primitive cattle of the country. It still carries signs that it was for centuries bred mainly for the plough, and even to-day, after several generations of improvement, a Hereford ox looks more suited for a plough team than any other English breed, with the exception of the Sussex. It is remarkable that its picturesque and very characteristic colour (red with white face and front) has only been fixed during the last half century or little more. When the first herd-book was published, in 1846, the editor grouped Herefordshires in four classes, *viz.*, mottle-faced, light grey, dark grey and red with white faces. Within the next 25 years all the colours but the last have practically disappeared. The modern development of the Herefords began earlier than that of the Shorthorns, having started with Richard Tompkins who died in 1723. The work was continued by his son and grandson and other breeders, among whom John Price and John Hewer were notable. Herefords were first introduced into America in 1817 by Henry Clay of Kentucky, but they made little progress until the '70s, when T. L. Miller of Illinois pushed them vigorously and successfully. He may indeed be regarded as the founder of the breed in the United States. It was introduced into Canada in 1860 by F. W. Stone of Guelph.

The Sussex.—The Sussex breed is not only in direct descent from the original stock of the country but also has probably undergone little change in outward appearance since the middle ages. Its native home is the Weald and for centuries it supplied the working oxen in that district and other parts. Low, in his well-known book, writing in 1845, says: "The practice of employing oxen in the labour of the farm is universal in the county of Sussex, and the native breed is eminently suited to this purpose, combining weight of body with a sufficient degree of muscular activity." The use of oxen for farm work continued longer in Sussex, and particularly on the stiff clay of the Weald, than in any other part of the country and this was mainly attributable to the suitability of the native breed for the purpose. The colour of Sussex cattle is a uniform red. They have a good reputation as grazers, and their quality as butchers' beasts has been increased since they began to be systematically improved about the middle of the last century. Mr. A. Heasman published the first three volumes of a Sussex handbook in which pedigrees were given from 1855. In 1888 the Sussex Herd-book Society took over the publication and in the same year the American Sussex Cattle Association was formed. The distribution of the breed is somewhat restricted and even in England it is not widely kept outside its own county, but there are herds in the United States and Canada where it is successfully used for improving the grazing qualities of native stock.

The Devon.—The Devon is another breed which can claim long descent, and cattle of this type were probably kept by the Britons who were driven to the west country by successive invaders. Devon cattle much resemble Sussex cattle except in size and are probably descended from the same original stock. They are deep red in colour but much smaller and more active than the Sussex. Like them they were for centuries bred primarily for the plough, and the more hilly country and harder climate adapted them to their environment. Their neat, compact, symmetrical form and rich ruby colour make them perhaps the most attractive breed in the country. They produce beef which is claimed, not without justice, to be equal if not superior to that of any other breed, and the extension of the popular demand for small joints should bring them into still greater favour with graziers. Although not naturally heavy milkers the cows yield milk of especial richness. The improvement of the breed both for meat and milk was undertaken early in the last century by Francis Quartly, and it was stated about the middle of the century that nine-tenths of the herds then kept were "directly descended (especially in the early parentage) from the old Quartly stock." Francis Quartly is said to have been incited to preserve and develop the breed by the fact that "breeders generally, on account of high prices, were selling their best stock for slaughter and keeping poor cattle in reserve." His brothers, William and Henry, as well as John Tanner Davy and his two sons continued the work. Davy's grandson not only possessed a famous herd but started the Herd-book in 1851 which was taken over by the Devon Cattle Breeders Society in 1884. It is stated by an American writer that Devons were probably the first "real pure-bred" cattle to reach America, "the vessel 'Charity' which sailed in 1623 being thought to have had Devon cattle on board." However this may be it is on authentic record that Coke of Holkham sent a present of a Devon bull and six heifers to Mr. Patterson of Baltimore which were the foundation stock of the American Devon Record. The breed is widely but sparsely distributed in America and in many other countries.

The *South Devon*, or as it is sometimes called, the South Ham breed, bears little resemblance to the cattle of the north of the county. It is larger and less symmetrical in frame and of a lighter red in colour. The cattle are excellent for dairying purposes and the milk is not only plentiful but rich in quality. They are better adapted to the lower levels than to the hills, and their natural home is along the southern coast of West Somerset, Devon and East Cornwall. The cows of this breed mainly provide the milk from which is made the well-known Devonshire and Cornish cream. The South Devon Herd-book Society was established in 1890.

The Longhorns.—The Longhorns were at one time widely distributed in England and Ireland and were no doubt survivors of an ancient race. They were big, heavy and rather ungainly with long drooping horns which gave them their name. The Shorthorns displaced them in almost every district, but they are famous as the stock on which Robert Bakewell exercised his remarkable skill as a breeder in the latter half of the 18th century. But even his art did not succeed in restoring them to general favour and not many years after his death it was recorded that "on the very farm on which Mr. Bakewell's original experiments were instituted and completed, and within many miles around there does not exist a single bull, cow or steer of the breed which he cultivated with so much labour." The breed has lately been revived and improved and there are now a number of herds in existence.

The Red Poll.—The Red Polls are an amalgamation of two breeds which had been common in Norfolk and Suffolk respectively for centuries. The Suffolk cattle appear, so far as records exist, to have been always hornless, while those of Norfolk were horned but had the blood-red colour which is now typical of the amalgamated breed. The year 1846 has been fixed as the date when the Norfolk and Suffolk were merged, and for many years the breed was termed "Norfolk and Suffolk Red Polled." A herd-book was started by Mr. H. F. Euren in 1874 and in 1888 this was taken over by the Breed Society which was then formed,

and the name "Red Poll" definitely adopted. It is claimed for the breed that they are "dual-purpose" in a greater degree than any other, that is that they are equally good as producers both of meat and milk. They are widely distributed at home and abroad but they are not kept in large numbers in any district except the two counties of their origin.

The Scottish Breeds.—The Scottish breeds include the Aberdeen Angus, the Ayrshire, the Galloway, and the Highland cattle. The *Aberdeen Angus*, commonly termed "Doddies," are a black polled breed. Their origin has been much discussed and it has been suggested that they sprang from a horned black breed which formerly existed in Scotland. Hornless or polled cattle have, however, been long known in that country. They were improved and their present type fixed early in the last century by a number of enterprising breeders, among whom Hugh Watson and William McCombie are most famous. It is pre-eminently a beef breed and the "Scotch beef" which ranks foremost in the meat markets comes mainly from these cattle. No other breed has such a record of success in competition at fat stock shows. It was not introduced into America until 1873, but since then its influence has spread widely in that and other countries. A herd-book was started in 1862 and in the first four volumes Galloways were also included. This fact indicates that there is a close affinity between Galloway and Aberdeen Angus cattle. The *Galloway* is a polled black breed and probably had a common origin although its native home is the ancient province or kingdom of Galloway in the south-west of Scotland. Its improvement was undertaken in the latter part of the 19th century by the Duke of Buccleuch and others and it now stands very high as a beef-making breed. It is almost more famous for its parentage of cross-bred cattle than for pure-bred animals. Galloway cows crossed with white Shorthorn bulls, which are bred for the purpose in that district, produce the "blue greys" which are more sought after by graziers than any other type of store cattle. The Galloway Cattle Society was formed in 1878 and published the first herd-book of the breed.

The *Highland* or *West Highland* breed, sometimes termed "Kyles," have their home in the Western uplands of Scotland. It is generally agreed that they are the aboriginal cattle of that district. Their long shaggy coat, sturdy frame, large head and branching horns, thick mane and heavy dewlap make them the most picturesque cattle in the British Isles. The colour varies but a tawny red is the most characteristic. They are very hardy, breeding and living all the year round on the hills, and thriving on scanty pasturage. They are slow in maturing but make beef of the highest quality.

The *Ayrshire* is the dairy breed of Scotland. It is no doubt derived from the native cattle of the county from whence it takes its name, but there seems to have been in the early part of the last century a considerable admixture of other breeds, including Shorthorn and according to some writers, Channel Islands cattle. The breed has been steadily developed for milk production and is now famous for the quantity of milk which the cows yield. The milk is largely used in making the cheese for which this part of Scotland is celebrated. The beef-making qualities of the breed are subservient to milk-production, but among the dairy breeds it takes a good position in this respect. The distribution of the Ayrshire is very wide. On the other side of the Atlantic it is most strongly represented in Canada, but it is also to be found on the Continent of Europe as well as in New Zealand. The Ayrshire Cattle and Herd-book Society was founded in 1877 and published the first volume of the herd-book in the following year.

Welsh Cattle.—The Welsh breed is black with fairly long horns. Up to the beginning of the present century there were two types known as North and South Welsh respectively, but they were amalgamated in 1904 when the Welsh Black Cattle Society was formed and a common herd-book was established. The cattle mature a little slowly but grow to a large size and furnish beef of prime quality. Under the name of "Welsh runts" they are bought largely by English graziers in the midland counties.

Channel Island Breeds.—The Jerseys may have sprung from stock imported from Normandy and Brittany but they have been

developed in their island home, and the purity of the breed has been secured by legislation dating as far back as 1763 prohibiting the importation of cattle. They have been introduced in large numbers into England, one of the earliest herds to be formed being that of Lord Braybrook in 1811. Not long afterwards a few were sent to the United States. They are now very widely kept. They are specially attractive in form and colour, and their "deer-like" appearance makes them popular for private parks. They yield milk which is remarkably rich in butter-fat and are therefore in demand for crossing with other breeds to improve the quality of the milk.

The *Guernsey* breed is of much the same type as the *Jerseys* but larger. Its merits for the dairy are practically equal. Cattle from the Channel Islands were long known as "Alderneys," a mistake which appears to have originated in a book on cattle which had a great vogue a century ago. There is no "Alderney" breed, the cattle kept on that island being *Guernseys*.

The Kerry and Dexter.—The *Kerry* is a breed of small black cattle in the south-west of Ireland from whence they have spread to all parts of that island as well as to England. They are very hardy and will thrive on the roughest fare. The cows are excellent milkers. An offshoot of the breed known as *Dexters* and at one time as *Dexter-Kerries* is said to have been established by selection and breeding from the best mountain type of the *Kerry*. They are smaller in size and are valuable as producers both of milk and meat.

Pedigree Cattle-breeding.—In the above notes on the principal breeds reference has frequently been made to their present wide distribution. The exportation of breeding cattle from the British Isles began at an early period owing to the natural excellence of the stock of the country. The general movement for the improvement of stock, of which Robert Bakewell was the most celebrated pioneer, but in which other enterprising breeders in various parts of the country participated in the latter half of the 18th century aroused the attention of agriculturists not only at home but abroad. Bakewell kept open house with rustic simplicity for all who came to see his stock. "In his kitchen," says the historian of English farming, Lord Ernle, "he entertained Russian princes, French and German royal dukes, British peers and sight-seers of every degree." At the "Holkham sheep-shearings" Mr. Thomas Coke entertained visitors on a princely scale. "Hundreds of persons," says the same writer, "assembled from all parts of Great Britain, the Continent and America," and these annual gatherings were described in the "Farmers' Magazine" as "the happy resort of the most distinguished patrons and amateurs of Georgic employments." The fame and merits of British live stock as the source from whence the finest cattle could be obtained became wide spread, and the enterprise of breeders was also displayed in finding markets for them. The expansion of the United States created a demand for cattle of superior type to form the foundation of new herds or to improve and develop the native "scrub" animals. It was recognised that cattle which had been long bred true to type, in other words "pedigree" cattle, could be relied on to impress their character on nondescript animals. The building up of a breed, as practically all the existing breeds have been built up, was a process of selection and elimination. The breeders who undertook this work came gradually to agreement as to the exact type to be fixed. In this the various live stock shows, notably those of the Royal Agricultural Society, the Highland and Agricultural Society of Scotland and a number of county and district societies throughout the country (see AGRICULTURAL SHOWS AND SOCIETIES), greatly assisted. By competition and comparison, owners of different herds were able to arrive at general uniformity and the "points" of a pure-bred animal of a particular breed were formulated in an accepted standard. The establishment and maintenance of a pedigree herd were undertaken by a limited number of breeders. Unlike ordinary stock-owners the main object of these men was not to supply cattle to the grazier or butcher, but to sell the animals solely for breeding purposes. The greater number of cattle kept by ordinary farmers are not pure-bred and to keep up the quality of their herds bulls and cows are from time to time purchased from the

pedigree breeders. But the home market was for many years subsidiary to the overseas market. Thousands of cattle have been sold, often at very high prices, to overseas buyers and during the last century the trade in pedigree stock was very remunerative. In course of time the demand naturally decreased. In the countries to which pedigree cattle were sent herds were gradually established which in a few years had attained a level of excellence equal to that of the parent stock. Thus the United States which for many years imported large numbers of pedigree stock from Great Britain has now become independent of the original source, and in the same way Canada, Australia and New Zealand are now much less regular customers. Argentina, where the improvement of the native stock came later, has in recent years been the chief buyer. On the basis of returns collected in 1921 by the Ministry of Agriculture from members of the various breed societies it was estimated that the number of "pedigree" cattle in England and Wales was 150,000. As the total number of cattle in that year was 5½ millions it will be seen that the overwhelming majority of the herds are "cross-bred." In many of these cases a pedigree bull is kept but the cows are of a mixed type.

Distribution of Cattle.—The report on the agricultural output of England and Wales (see AGRICULTURE, CENSUS OF) contains some interesting statistics of the growth in numbers and present distribution of cattle. The following table shows the number of cattle at successive periods in relation to the agricultural area and the population of the country:—

| | Number of cattle per 1,000 acres of land under cultivation. | | | Number of cattle per 1,000 of population. | | |
|------------------|---|---------------|--------|---|---------------|--------|
| | Cows and heifers in milk or in calf. | Other cattle. | Total. | Cows and heifers in milk or in calf. | Other cattle. | Total. |
| 1867-76 . | 68.0 | 104.1 | 172.1 | 77.7 | 119.0 | 196.7 |
| 1877-86 . | 70.1 | 109.4 | 179.5 | 73.6 | 114.9 | 188.5 |
| 1887-96 . | 75.6 | 115.5 | 191.1 | 71.8 | 109.6 | 181.4 |
| 1897-1906 . | 79.7 | 121.7 | 201.4 | 66.9 | 102.1 | 169.0 |
| 1907-14 (8 yrs.) | 86.4 | 127.0 | 213.4 | 65.6 | 96.5 | 162.1 |
| 1915-24* . | 94.6 | 129.2 | 223.8 | 69.0 | 94.2 | 163.2 |
| 1925 . | 105.3 | 134.0 | 239.3 | 69.8 | 88.7 | 158.5 |

*In the years 1915 to 1920 inclusive the population figures excluded non-civilians.

The density of the cattle population varies greatly. In England and Wales as a whole there are, as shown above, 239 cattle per 1,000 acres of agricultural land of which 105 are cows and heifers in milk or in calf and 134 other stock. Wales is more heavily stocked than England, the comparative figures being:—

| | England | Wales |
|---|---------|-------|
| Cows and heifers in milk or in calf | 104 | 119 |
| Other cattle | 129 | 174 |
| | 233 | 293 |

The county which is most densely stocked is Anglesey with 383 head, and the most sparsely stocked is west Suffolk with 89. Cheshire stands first for cows and heifers with 249 and west Suffolk lowest with 32. With other stock Anglesey takes the lead having 266 head per 1,000 acres and west Suffolk again lowest with 57.

The Cattle Trade.—The number of cattle exported from Great Britain "for breeding," i.e., pedigree stock, was 6,501 in 1926 and 6,827 in 1925. Among cattle exported "for food," the British trade accounts now show those sent to the Irish Free State. The number was 10,411 in 1926 and 12,991 in 1925.

The number of cattle imported into Great Britain for food was 708,868 in 1926 and 800,144 in 1925. Of these the Irish Free State sent 628,918 in 1926 and 688,120 in 1925. Practically all the remainder came from Canada. The cattle brought into Great

Britain from Ireland and a large proportion of those from Canada are "stores," that is young stock in a more or less lean condition which have to be kept and fattened for slaughter. The breeding and fattening of cattle are two distinct businesses carried on in the main by separate individuals. One farmer devotes himself to the breeding and another, probably in a different and distinct district, to the fattening. This division of functions arises out of natural conditions. In many parts of the country, particularly in the west Midland counties and in Wales, the natural pasturage is plentiful but generally poor, but it is well adapted to the breeding of cattle and much of the country being hilly the conditions are healthy, and tend to develop vigorous and hardy young stock. In the Midlands and in one or two other districts there are some of the finest natural pastures in the world on which cattle can be fattened even without artificial food. From these circumstances there developed in very early times a regular trade. Dealers would collect from various farms a number of young store cattle and drive them to the fattening districts, selling them there either directly or at the local markets to the graziers. This was a regular trade not only long before the advent of railways but before roads were generally made. The cattle were driven, as we should say, "across country" on the waste land and commons which then spread over so large an area and their regular tracks or "droveways" may be traced to this day. Similar droveways were also made by herds of fat cattle sent to the London market from as far distant as Scotland.

As modern farming, and particularly turnip cultivation and the four-course system were introduced, a new class of "grazier" and a new method of "grazing" arose. Instead of fattening cattle on pasture in the summer, the stores are shut up in the winter in stalls and yards and fattened on roots supplemented by oil-cake, or some other form of artificial food. The "stall-feeding" system was first adopted in Norfolk (the home of the four-course rotation) but it soon spread to Aberdeenshire. It is now widely practised, but the two counties in which it first arose still retain their pre-eminence.

As means of transport improved and commercial methods became more complicated, the progress of the young animal from its birthplace to its home became less simple. The trade in store cattle was developed and the business of rearing them was specialized. From calf-hood to maturity the store may now pass through successive stages on different farms. A recent writer on cattle gives the "life history of a store-bullock bred and reared on pasture" as follows:—

| Situation | Age |
|-----------------------------------|-------------------|
| On a breeding farm | Birth to 6 months |
| Medium "store-land" | " " |
| Medium " " | 7-12 " |
| Medium " " | 13-16 " |
| On a store-rearing farm | 17-24 " |
| Good store-land | 24-30 " |
| Good " " | 31-36 " |

After this he goes to another farm for the finishing process. This may be regarded as an extreme case, but it fairly indicates the complexity of the store-cattle trade. At the other extreme there is the case, not uncommon and tending to become more popular, of the breeder who rears and fattens his own stores on his own farm.

The cattle dealer as an intermediary between the breeder and the feeder and the feeder and the butcher has played a large part in the organization of the trade in both store and fat stock. But within the last half-century he has been to a large extent eliminated by the auctioneer. Not only at the ancient cattle markets but in numerous "auction marts" which have sprung up all over the country, sale by auction has supplanted the old methods of sale through intermediaries and also of direct dealing between farmers and butchers.

BIBLIOGRAPHY.—*The Complete Grazer*, by a Lincolnshire grazer (1st ed. 1805, several later eds. extended and revised by different writers); *Domesticated Animals of the British Islands*, by David Low (1845); *Farm Live Stock of Great Britain*, by R. Wallace (1907); *Types and Breeds of Farm Animals*, by Charles S. Plumb (Ginn and Co., 1906); *Cattle and the Future of Beef-production in England*,

by K. J. J. Mackenzie, with a preface and chapter by F. H. A. Marshall (Camb. Univ. Press, 1919). These deal comprehensively with cattle generally. Of some of the principal breeds, such as the Shorthorns, Devons, etc., the *Herd-book* of each breed contains an account of its history and characteristics. (R. H. R.)

UNITED STATES

The vastness and varied topography of the United States make not only possible but necessary a cattle-breeding industry very different from that of Great Britain. Instead of the diversified and intensive farming, general in Great Britain, great areas in the United States are devoted to special crops, as in the corn belt of the Middle Western States, the wheat belt of the Red river valley and Kansas, the cotton belt of the South. The most diversified farming is in the North-eastern States. Live stock farming co-ordinates with the crop system; the location of the different phases of cattle breeding is as varied as the culture of the crops.

Cattle Feeding.—The line between beef-making and dairying is more closely drawn in the United States than in Great Britain. American live stock operations are more specialized. One is either a beef maker or a dairyman, and this distinction was formerly characteristic of whole districts. The leading dairy States are still exclusively so, although interest and operation in beef cattle is expanding in the East. On the other hand, the corn belt States, formerly almost exclusively devoted to cattle feeding, now rank high in dairy industry. The bulk of the milk supply of the United States is derived from cows of dairy breeding, while most beef bred cows suckle calves and are not hand milked. But the beef and milk combination is becoming more popular as farm labour problems grow more complex in the dairy sections, and as land values increase in the beef breeding districts. Generally speaking, dairying dominates in the East, with many cities and large industrial centres, although Wisconsin, Minnesota and Iowa rank first, third and fourth, respectively, among the dairying states, while Iowa also ranks first in beef production. Feeding cattle for beef is most important in the corn belt States, but a majority of the cattle fed there are bred on the far Western ranges. This fact is responsible for one of the most important divisions of the live stock industry—cattle ranching on a large scale, as in the Pan-Handle district of Texas and New Mexico, the Sand Hills of Nebraska, the North Park of Colorado and in Montana, Wyoming, Idaho and the Dakotas.

The life cycle of a beef steer takes him from the Western range, where he is bred and reared till weaned, to the Mid-Western feed lots (enclosures with corn and hay racks), where he is fed for market, thence to a great packing centre like Chicago, where he is made into a carcass of beef, to be transported in refrigerator cars to Eastern cities, where most of the best beef is consumed. The cattle range, which constitutes the chief source of the feeder cattle supply, is an American institution, although duplicated in Australia and Argentina. Grade cow herds, numbering several hundred, are grazed on Government or private lands, 10 to 40 ac. per head, depending upon rainfall and forest. Under favourable conditions one ton of hay and 40 ac. of grass will support a cow. Pure bred bulls are run with the cows, one mature bull to 20 or 30 cows. Many ranges maintain pure bred herds to furnish their own bulls. Others buy by the carload from the pure bred herds of the central States. Most calves are born in April and rounded up in July to be castrated, branded and usually dehorned, and, with the modern demand for feeder calves to make baby beef, many heifers, as well as steers, are shipped to feed lots in the fall. The ruling demand is for baby beef, and heavy cattle are usually penalized on the market, although the highest price for 1926-27 was paid for heavy steers. But the demand is very limited for sound economic reasons. The American family is smaller than in previous times, beef is more costly, hence smaller cuts from lighter cattle are bought. Therefore the packer prefers 900 to 1,000-lb. cattle. The feeder, on the other hand, finds calves much more productive per unit of feed consumed than yearlings or two-year-olds, thus rivaling hogs. Breeders find the cost of wintering calves kept for stock out of proportion to the selling price of the yearling feeders; furthermore, heifer calves are taken almost as readily and at only slightly lower prices than steer calves, not suffering the

8. Longhorn cow; 1st prize at Cambridge

discrimination made against yearling heifers. Baby beef best serves the interests of all concerned.

Dairying.—Dairying is so highly specialized that distinction is made between the breeder of pure bred dairy cattle, in whose case milk constitutes only a by-product, and the dairy operator, who keeps a bull merely to have fresh cows and does not raise his own replacements. Grade dairy cows, soon due to freshen—springers, as they are called in the trade—are purchased by the car load in the Middle West, and are shipped into the Eastern States to stock the large dairies near the cities. Many of these cows are not re-bred, but are fattened and slaughtered when their period of profitable lactation is completed. Other dairymen kill the calves at birth; these owners are concerned only with the fresh cow, nondescript bulls serving this purpose. Many dairy operators, recognizing the difficulty of securing good cows, and the importance of excluding tuberculosis and abortion disease infection, are raising the heifers from their best cows, sired by pure bred bulls. This results in high-grade cows of improved productive capacity.

Importations.—The United States has evolved three or four breeds of hogs, one of sheep and two of horses, but has originated no breed of cattle. But American breeders have made important contributions to the improvement of foreign breeds. The fact of importation has no value in Hereford and Holstein cattle. There have been but two notable importations of Herefords in nearly 25 years, and neither of these bulls is held to strengthen a pedigree. It is still longer since any Holsteins were imported, and records of performance of American Holsteins surpass those made by the cattle of Holland. The Shorthorn breeder highly values the imported cow, and imported bulls usually out-sell American bred bulls. Aberdeen-Angus cattle, chiefly bulls, are imported in less numbers than Shorthorns. Certain American firms import Jerseys and Guernseys, both bulls and cows, while some American breeders buy in the Channel Islands. The St. Lambert Jerseys, which, as a family, originated in the United States, are still in favour to some extent on account of their high production, but in price range and show ring preferment, the Island type leads. Ayrshires of both sexes are imported, and the old New England type of Ayrshire has completely given way to the foreign type.

Distribution.—Shorthorns are the most widely distributed and generally useful of the beef breeds. They are in most States in which cattle are bred. Their grades are frequently found on the ranges of the North-west, and the feed lots of the corn belt, and Shorthorn bulls are used more than any other beef bulls to grade up common herds and to sire good veal calves from milking cows. Only pure Scotch cattle are in demand, except in some sections of the East, where good herds of milking Shorthorns have been established. The Polled Shorthorn, an American development, has been much improved, and some of the best Scotch breeding is now found in the pedigrees of these cattle. Herefords, usually red with white face, have increased in popularity. They dominate the ranches, 90% of the ranch cattle being white faced, and they consequently dominate the feed lots. The prevalence of white faced cattle in the feeding districts is somewhat misleading as to breed preference on the part of the feeders. Most cattle feeding operations involve from a carload to 15 or more head, and uniform age, colour and finish are required. It is impossible to secure, except from the big ranches, as large a number of uniform cattle as required by most feeders. Since Herefords have proved best adapted to ranch conditions, these ranch bred feeders will generally be white faced. Ranchmen claim that the best herds of white faced ranch cattle have some Shorthorn blood, and they introduce a Shorthorn cross occasionally to maintain size. Herefords are conspicuous at the shows, sometimes outnumbering the Shorthorns. Polled Herefords, evolved from pure bred stock, as in the case of the Polled Shorthorns, are bred to a considerable degree of excellence, and are preferred to the horned cattle in some regions.

Aberdeen-Angus cattle are not so numerous in America as either Shorthorns or Herefords, but have a higher show record. At the International Live Stock Exposition at Chicago, they have won 14 of 25 single steer grand championships, 17 of 23 steer group grand championships, 21 of 25 fat carload grand championships, 24 of 25 carcass grand championships, and more than 70% of the total

awards in the carcass contest. Galloway cattle have found some favour on the North-west ranches and in Alaska, where they were introduced by the U.S. Government primarily for milk production. There are few pure bred herds. There are few herds of Devons, and of Sussex practically none. West Highland cattle are rarely seen except in parks. Holstein-Friesians are most numerous in the three leading dairy States, and all dairy districts where general market milk is the rule. They hold all records for milk production and have gained more honours for butter fat than any other breed. Guernseys lead in the Grade A milk field. Their promoters are featuring "Golden Guernsey" milk as a special product in effective propaganda. Jerseys were the original butter cows in the United States and are still preferred in many sections, especially the South. Ayrshire bulls have been used less than bulls of any other dairy breed for grading up, but the number of pure bred herds shows substantial increase. Red Poll cattle are in competition with milking Shorthorns as dual purpose cattle, but show little gain in number of herds and merit.

Registration.—American associations are maintained for the registration of cattle, and eligibility is based largely on the rules that govern in the older countries. A notable exception is found in the case of Shorthorns, which are not admitted under a top-cross rule as in Great Britain. Red and White Holsteins are also ineligible. Further, there is no system of selective registration of Jerseys as on the Island of Jersey.

(C. W. GA.)

CATULLUS, GAIUS VALERIUS (84?–54 B.C.), Rome's greatest lyric poet. According to St. Jerome, in his continuation of the Eusebian Chronicle, Catullus was born at Verona in 87 B.C., and died in 57 B.C. at Rome, aged 30. His names, as given above, may be regarded as certain, but internal evidence shows that certain poems were written two or three years after 57 B.C., the date of Catullus' death according to Jerome. Thus xciii. was composed in 55 B.C., lv. either in that year or later, while xi., xxix., xlv. all appear to be written after Caesar's first invasion of Britain (55 B.C.). Since no poem is certainly later than 54 B.C., it is best to retain Jerome's reckoning of Catullus' age as thirty years but to suppose him to have lived from 84 to 54 B.C.

Jerome's statement that Catullus was born at Verona is confirmed by other authorities. His father was important enough to act as Caesar's host, and it was probably at or near Verona that Caesar accepted the poet's apologies for the attacks on himself and Mamurra (xxix. and lvii.: see Suetonius *Jul.* 73; xciii.) may represent Catullus' reply to earlier advances on Caesar's part. The poet's attitude was not due to republican sentiment, but the result of personal animosities. In xxix. he arraigns Pompey along with Caesar, and in xi. he recognizes the latter's greatness.

Catullus' complaints of poverty are not to be taken very seriously. He possessed a villa at Tibur as well as a retreat at Sirmio on Lake Garda, and the poems prove that he had the means to figure in the best society. Still his purse was often no doubt, as he says, "full of cobwebs" (xiii. 8).

On reaching manhood Catullus was sent to try his fortune at Rome. The premature death of his brother in Asia Minor seems to have recalled him to Verona (*cf.* lxviii.). In 57 B.C. he made a belated attempt at a public career by accompanying Memmius, the patron of Lucretius, to Bithynia, of which province Memmius had been appointed governor. His hopes of lining his purse at the expense of the provincials were not realized, and in the spring of 56 B.C. he left Nicaea (xlv.) and returned to Italy, perhaps on his own yacht (*cf.* iv.); *en route* he visited his brother's tomb in the Troad (ci.). His delight at seeing Sirmio once more is charmingly expressed in xxxi. The poems show that his last years were divided between Verona and Rome. As a Transpadane, Catullus found many compatriots in the capital, and among them several representatives of the new movement in poetry led by Valerius Cato,

himself a native of Cisalpine Gaul. The poems reveal him on terms of intimate friendship with certain of the younger members of this circle; e.g., Calvus (xiv., l., liii., xcvi.), Cinna (x., xcvi., cxiii.), Cornificius (xxxviii.). He appears to have been acquainted with the two leading orators of the day—Cicero (xlix.), and Hortensius (lxv. and xcvi.). Among friends of less eminence he counted a Caelius (lviii.) whom some identify with Cicero's protégé M. Caelius Rufus, thinking that lxix. and lxxvii. addressed to a Rufus, refer to the same man; this is possible, but in that case another Caelius must be meant in c., since Cicero's friend was not a native of Verona. Particularly dear to Catullus, but otherwise unknown to us, were two friends Veranius and Fabullus (ix., xii., xiii., xxviii., xlvii.), while in i. he dedicates his *libellus* to the biographer and historian Cornelius Nepos, who in after years left it on record that in his opinion Catullus and Lucretius were the two greatest poets of that period (Nepos, *Life of Atticus* xii., 4). Among Catullus' enemies the most furiously attacked in the poems—apart from Caesar and his lieutenant—are the pair Furius and Aurelius (xv., xvi., xxi., xxiii., xxiv., xxvi.), and one Gellius, who is the target of no fewer than seven epigrams. Other victims of his invective are Ravidus (xl.) and Rufus (see above), his rivals in love; a freedman Thallus (xxv.); a ridiculous fop Egnatius (xxxvii., xxxix.). To a false friend Alfenus he writes more in sorrow than in anger (xxx.). The most important influence in Catullus' life was that of his mistress Lesbia. Her real name was Clodia (Apuleius, *Apol.* 10); Catullus chose the pseudonym for its connection with Sappho (li., a translation of a famous ode of Sappho, was perhaps a first tribute to his mistress' charms). There can be little doubt that Clodia was the notorious sister of the demagogue, married in 63 B.C. to Q. Metellus Celer and suspected of responsibility for his death in 59 B.C. Cicero mentions her several times in his Letters, and has left a graphic picture of this dangerous beauty in the speech (*Pro Caelio*), in which he defended M. Caelius Rufus (see above), also one of her lovers, against the charge of having tried to poison her. Though Cicero writes as an advocate and Catullus as a lover, their descriptions are not inconsistent, and the final proof of identity is contained in lxxix., the *Lesbius* of which poem clearly covers a Clodius, not, however, the demagogue P. Clodius, but Sex. Clodius, a kinsman and associate of Publius, whom rumour represented as having relations with Clodia (Cicero, *De Dom.* 25) similar to those attributed to *Lesbius* by Catullus. A recent attempt to identify Lesbia with a younger sister and namesake of Metellus' wife, who married L. Lucullus and was divorced by him for alleged relations with her brother, appears unconvincing. Catullus was Clodia's lover during Metellus' lifetime (cf. lxxxiii.); the husband's death apparently brought other rivals on the scene, and Catullus' allegiance had been sorely tried before he left for Bithynia, but xi., the final renunciation, is subsequent to his return (see above). The data do not suffice to fix the course of the liaison more exactly.

Catullus' poetical activity began soon after his assumption of the *toga virilis* (cf. lxxviii. 15–17); references in the poems suggest that he sometimes published his pieces separately or in small groups (cf. i. 4; xvi. 3; xlii.; xliii. 7; liv. 6). Later (cf. i.) he formed a collection of his compositions and dedicated it to Cornelius Nepos, but it is a moot point what this *libellus* contained, whether it was identical with the present collection, and, if not, how the latter was formed. As arranged in the mss., the poems fall into three sections, viz., (1) i.–lx., shorter lyric pieces, (2) lxi.–lxxviii., longer poems in a variety of metres, (3) lxxix.–cxvi., elegiac epigrams. The hypothesis most in favour recently is that our present collection was formed in outline by Catullus himself before his death, and that afterwards his literary executors inserted in the groups so arranged sundry other material discovered among his remains, including unfinished pieces like xiva. and lx.

Though Catullus was an Italian of the Italians in character and temperament, it is impossible to appreciate his poetry correctly except in relation to Greek and more particularly Alexandrian poetry. Like that of the other *novi poetae*, his work has two aspects. On the one hand we have the shorter pieces in which any and every emotion of the moment finds instant expression, on the

other the poems which earned Catullus the title of *doctus*, considerably longer than his *nugae* but short when compared with the *Annales* of a Volusius (xxxvi., xcvi.). The poet's debt to Alexandrian models in these longer compositions, though hard to control to-day owing to the fragmentary survival of later Greek poetry, is universally admitted. Catullus himself declares lxvi. to be a translation from Callimachus (cf. lxv. 16); lxiv. is cast in the mould of a Hellenistic *epyllion*; lxxviii., a mixture of the personal and narrative elegy, framed as a letter to a friend, also has Alexandrian forbears; lxii. adapts an epithalamium of Sappho after the manner of the later Greeks; even lxxiii. (the *Attis*) which gives an impression of striking originality probably follows in the track of Callimachus or some other Alexandrian. The most original of these longer poems is probably lxi., the epithalamium for Manlius Torquatus and Vinia (or Iunia) Aurunculeia, since here Catullus has tried to fuse the native *versus Fescenninus* with the Greek *hymenaeus*; it contains touches, e.g., 216–220, marked by a tenderness unknown otherwise before Virgil. Even in the *nugae* Catullus' debt to Greece is greater than was realized till recently. Just as the life of the *γέωτροι* with its interest centred on love and letters had been anticipated by that of the later Greeks (compare l. with the lines of Hedylus [*flor. circ.* 290 B.C.] preserved in Athenaeus xi. 473a; see also xxv. and xxxviii.), so the forms, lyric *παλῦιον* and elegiac epigram, to express these emotions, had been fixed by the same predecessors. Hellenistic lyric only surviving in meagre fragments, Catullus' originality appears greater here than in his elegiacs which we can compare with the epigrams of the Greek Anthology, but metre (especially the scazon iambic and phalaecan hendecasyllabic), subject-matter, and often phrasing indicate his obligations. The poems on Lesbia's sparrow (ii. and iii.) and that on the yacht (iv.) had Hellenistic prototypes, and an Alexandrian element crops up even in such an ardent love-poem as vii. (cf. ll. 3–6). Nevertheless it is in these shorter pieces that Catullus is most Roman and most himself. The attacks on the smaller fry who had incurred his displeasure often revolt us to-day by their gratuitous obscenity, but the *iambi* on Caesar and his associates, which recall but far surpass in bitterness the popular lampoons current at the expense of the *imperator unicus*, were justly considered by their chief victim to have branded him with *perpetua stigmata*. On the other side the Lesbia cycle cannot be paralleled in ancient literature for sincerity of passion, passing through all the stages of joyous contentment, growing distrust, and wild despair to the poignant adieu of the disillusioned lover.

The best edition of Catullus is that by W. Kroll (Leipzig, 1923). The best English commentary is that by R. Ellis (2nd ed., 1889). Neither the current Oxford text (1904) nor the Teubner (1923) can be considered satisfactory. Volume vi. of the Loeb Classical Library (1912) contains a text and translation of Catullus along with Tibullus and the *Pervigilium Veneris*. The most recent translations into English are by Sir William Marris (1924) and F. A. Wright (n.d.). See also H. A. J. Munro, *Criticisms and Elucidations of Catullus* (2nd ed., 1905); K. P. Harrington, *Catullus and his Influence* (1923); Frank Tenney, *Catullus and Horace* (1928). (E. A. B.)

CATULUS, the name of a distinguished family of ancient Rome of the gens Lutatia. The following are its most important members:

1. **GAIUS LUTATIUS CATULUS**, Roman commander during the first Punic War, consul 242 B.C. With a fleet of 200 ships, he occupied the harbours of Lilybaeum and Drepanum. The Carthaginian relieving fleet was totally defeated off the Aegates Islands, March 10, 241, and Catulus shared in the triumph, though, owing to a wound, he took no part in the operations. (See PUNIC WARS: First, *ad fin.*)

2. **QUINTUS LUTATIUS CATULUS**, Roman general and consul with Marius in 102 B.C. In the war against the Cimbri and Teuton (qq.v.) he was sent to hold the passage of the Alps, but was forced back over the Po (see MARIUS, GAIUS). In 101 the Cimbri were defeated on the Raudine plain, near Vercellae, by the united armies of Catulus and Marius. The chief honour being ascribed to Marius, Catulus became his bitter opponent. He sided with Sulla in the civil war, was included in the proscription list of 87, and committed suicide. He was distinguished as an orator and writer, and is said to have written the history of his consulship and the

Cimbrian War. Two epigrams by him have been preserved and are published in W. W. Merry's *Fragments of Roman Poetry* (Oxford, 1898, p. 173).

See Plutarch, *Marius, Sulla*; Appian, *B.C. i. 74; Vell. Pat. ii. 21; Florus iii. 21; Val. Max. vi. 3, ix. 13; Cicero, De Oratore, iii. 3, 8; Brutus, 35.*

3. QUINTUS LUTATIUS CATULUS (c. 120–61 B.C.), son of the above, was a consistent supporter of the aristocracy. In 78 he was consul with Marcus Aemilius Lepidus, who proposed the overthrow of the Sullan constitution. Catulus vigorously opposed this, but Lepidus marched on Rome at the head of an army. He was defeated by Catulus and Pompey and fled to Sardinia. In 67 and 66 Catulus unsuccessfully opposed the Gabinian and Manilian laws, which conferred special powers upon Pompey. He consistently opposed Caesar, whom he tried to implicate in the Catilinarian conspiracy. Caesar, in return, accused him of embezzling public money during the reconstruction of the temple on the Capitol. Catulus's supporters rallied round him, and Caesar dropped the charge. Although not a man of great abilities, Catulus exercised considerable influence through his political consistency and his undoubted solicitude for the welfare of the state.

See Sallust, *Catilina*, 35, 49; Dio Cassius xxxvi. 13; Plutarch, *Crassus*; Suetonius, *Caesar*, 15.

CAUCA, a department of Colombia, South America, lying on the Pacific coast. Pop. (1918) 238,779; area 20,403 sq.m. The Western Cordillera, traversing nearly its whole length from south to north, and the Central Cordillera, forming a part of its eastern frontier, give a very mountainous character to the region. It includes, besides, the fertile and healthful valley of the upper Cauca, and a part of the coastal plain. The region is rich in mines and valuable forests, but its inhabitants have made very little progress in agriculture because there are not adequate transportation facilities. The capital of the department is Popayán, pop. (1918) 20,235.

CAUCASIAN AREA, NORTH. A province in the Russian Socialist Federal Soviet Republic. The boundaries are: West, the Ukraine, the Sea of Azov and the Black sea; south, Abkhazia and Georgia; east, Daghestan and the Kalmuck area; north-east, Stalingrad; north-west, Voronezh. Area 287,410 sq.km. Pop. (1926) 8,324,788; urban 1,408,085, rural 6,916,703. The following autonomous areas (*q.v.*) are linked to it administratively: The Adigei-Cherkess, Karachayev, Kabardino-Balkarsk, North Ossetia, Ingush, Chechen.

The southern part of the area consists of the foothills and northern slopes of the Caucasus mountains, but most of the area is a fertile plain, which has always been a zone of movement of peoples, owing to its situation between the Black sea and the Caspian, with the Caucasus on its southern flank. It formed a link between the Mediterranean civilizations which established trading colonies here, the Persian and Turkish empires of Asia Minor, the Tatar and Mongol steppe peoples, and the Russians from the north-west, all attracted by its fertility and its trading possibilities. In 1926 the varying elements in the population included Russians (Great Russians, Ukrainians and White Russians) 83.38%, Chechens 2.72%, Ossetians 2.03%, Armenians 1.98%, Kabardians 1.85%, Greeks 1.14%, Germans 1.06%, Cherkess 1.03%, with Ingushetes, Karachayevs, Jews, Poles, Kalmucks, Georgians, Tatars, Turks, Persians, Moldavians, Estonians, Czechs and Lesgians. In spite of these varied elements, the province has a certain economic unity: it is essentially an agricultural area undergoing a process of industrialization, and has an important export trade. In varying forms this export trade dates from a great antiquity. The west and south-west, with rich black earth soils, have intensive agriculture, market gardening and dairying, and a good net of communications; proximity of the Black sea and the Caucasus, leads to increased rainfall and modification of summer heat and winter cold, abundance of streams and a longer vegetative period (*i.e.*, number of days with a temperature above 4° C); in the Black sea area there are 275 days, and in Krasnodar, Maikop and Armavir 250, as against 200–210 days in the Donetz and Shakhtinsk areas. Towards the north and in the east the climatic influences are Continental, with

drought conditions, and in the east the soils are chestnut-coloured (favourable to the growth of summer wheat in wet years), with about 10% saline and arid sands unfit for agriculture. The chief crops are summer wheat in the northern provinces, a hard variety in demand on the world market for flour and macaroni, etc., winter wheat in the wetter south-west districts, barley, maize, rye, millet and oats. Sunflower seed, providing food, oil, fuel and potash is increasingly cultivated in the Kuban area, as is sugar beet. There are vineyards in the Don, Black sea, Kuban and Tersk (western Tersk T.) areas: the Don wines are good, but the Kuban and Tersk wine is sharp. Tobacco is cultivated in the Kuban and Black sea provinces. In the south-west Kuban and near the great cities and health resorts market gardening (especially of melons, pumpkins and potatoes) is prosperous. Agriculture suffered severely in the World War period and is only slowly recovering, the wine produced being only 44% of the 1913 total. In 1927 the sown area was 88.9% of the 1913 area, but the harvest was only 65.2%.

Cattle rearing is decreasing, and is mainly limited to the dry steppe and the hill pasture meadows. The stock of horses greatly diminished between 1914 and 1921. Horses are bred in Kuban and Kabardia and by the steppe nomads. In Kuban they are used as working animals. The grey Black sea cattle, related to the Ukrainian cattle, are the best working oxen, and are bred and used in the north and near Maikop. Dairy cattle (German) are in demand near the cities, while the Kalmucks breed the best cattle for meat. Formerly in the Stavropol steppe and the Salsk area there were 4,000,000 head of merino sheep, but they were catastrophically destroyed between 1914–21 and there are now only 300,000 or 400,000. Goats are kept for milking, especially in the hill areas. Pig breeding has recovered its pre-war level, especially in the Kuban and the maize zone of the foothills. Hens, geese, ducks and turkeys numbered 11 million in 1925, and eggs, feathers, down and live and dead birds are exported (mainly to the home Russian markets). In Kuban, Tersk and the foothills the long, warm summer and the flora favour beekeeping, and much wax of good quality is exported.

The steppe and much of the plain is treeless, except near the streams and along the Don valley (oak and elm). On the foothills patches of mixed steppe and forest lead to the continuous beech, oak, hornbeam, ash, maple, lime and elm forest, above which are pines, birches and silver firs, with Alpine meadows higher still. The Black sea slopes yield yew and chestnut. The Government is controlling timber felling on the foothills in view of the importance of tree growth in regulating the streams and in fixing the soil. In the higher regions much timber is neglected because of lack of labour and lack of transport. Of the timber most goes to the treeless steppe, the markets of the Near East and the Mediterranean. The silver fir is used in the home region for cellulose manufacture.

Fishing for bream, carp, herring, mackerel, sturgeon and anchovy is carried on in a primitive way, but suffers from lack of refrigerators and of quick transport. The mineral wealth consists of the Grozny and Maikop-Taman naphtha beds, the silver, lead and zinc ores of Alagir, south of Vladikavkaz, lead ore on the Upper Kuban, anthracite in the Shakhtinsk area and south of Batalpashinsk, and coal and iron ore on the north shore of Azov. Some of the mines are worked by peasant artels. The chief manufactures are foodstuffs (flour and fish, fruit and vegetable preserves) especially in the Kuban, naphtha refining at Grozny, Tuapse, Maikop (aviation benzine), cement at Novorossiisk, tobacco at Rostov, Krasnodar, Armavir and Vladikavkaz, agricultural machinery at Rostov, Taganrog and Sylin, leather at Taganrog and Maikop, sugar near Armavir and in the Kuban. Maize products (brandy, starch and flour), textiles (wool, cotton, stockings, ropes), soap, potash, bricks, glass, tiles and paper are also manufactured and there are printing works at Rostov and other towns. Side by side with the factory industries go the koustar (peasant) industries and in the flour milling and oil pressing they produce 45% of the total. The chief towns (*q.v.*) in order of size of population in 1926 are: Rostov-on-Don 233,491; Krasnodar 154,201; Taganrog, Armavir, Vladikavkaz, Grozny, Novoross-

siisk, Stavropol, Pyatigorsk, all over 50,000; and Shakhti, Batalpashinsk, Millerop, Salsk and Maikop.

These towns and their population are an indication of the marked industrial development of the area, as is the fact that naphtha and not wheat is now the chief export. But agriculture is still, as in the past, the chief occupation of the area. In the internal life of the province it affects directly the welfare of four-fifths of the population and indirectly its development affects the remaining one-fifth, regulating markets, causing seasonal overfreightage of the transport-network (railways, ports, elevators and refrigerators) and supplying the raw material for the factories and the food for the workers. The importance of the North Caucasian area in the economy of the U.S.S.R. as a source of supply of wheat and raw material is recognized by the Government. The electrification of six areas in the district and the development of canals, both for irrigation and for transport, are planned for completion in 1930 and 1931, and a certain proportion is already completed (1928).

CAUCASIAN LANGUAGES. This term is applied to the languages used on the Caucasian isthmus which do not belong to the Indo-German, or to the Semitic, or to the Turco-Mongolian family. They are divided into three groups—the *East Caucasian*, the *West Caucasian* and the *South Caucasian*. The East Caucasian group can be divided into eight branches: 1. The Chechen branch (the chief being the Chechen language of the middle course of the Terek and Daghestan); 2. Avaro-Andi (12 languages in West Daghestan, the chief being the Avar language); 3. Darghi (East Daghestan); 4. Samur (South Daghestan, the chief being the Kuri language, near Derbent); 5. Lakk or Kasi-Kumuk (Central Daghestan); 6. Artchi (one village in Central Daghestan); 7. Hinalugh (one village near the mountain Shah-Dag); and 8. Udi (two villages near the town Nukha). The West Caucasian languages have three branches: 1. Abkhaz—region of Sukhum-Kale; 2. Ubykh—formerly dominant in the region of Sochi, but now spoken only by a few families in Asia Minor; 3. Adyghe, with two dialects—Kabardi (in the so-called Kabarda, principal town Naltchik) and Kiakh or Cherkess (region of Kuban and the Caucasian shore of the Black sea). The South Caucasian languages are: 1. Georgian with its dialects; 2. Mingrelian and Laz; 3. Svanetian.

East Caucasian and West Caucasian are related and may be considered as two branches of the North Caucasian group. The relationship between this and the South Caucasian group has not, as yet, been scientifically proved, and in the present state of our knowledge the North Caucasian and South Caucasian groups must be considered as separate.

The North Caucasian languages are distinguished by an extraordinary abundance of *consonants*, which in Cherkess are 57 in number. Very characteristic of the phonetic system of North Caucasian languages are the lateral consonants, which convey the impression of combinations *kl*, *gl*, *thl*; then a great number of consonants of the type *k*, pronounced in the deep back part of the palate, etc. This superabundance of consonants is moderated in the East Caucasian group where consonants rarely come into contact with each other; but in West Caucasian languages the contact and combination of consonants occur very frequently, and the most complicated combinations, very difficult to pronounce, are admitted.

In the East Caucasian languages substantives are divided into classes or "genders"; their number varies in different languages (from two to six). In most cases, neither from the meaning of the word nor from any outward formal symptom is it possible to know to which class the substantive belongs. Very often the same substantive belongs in the singular to one class and in the plural to another. A consonant, specific for each group (*w*, *b*, *d*, *r*, *y*) is added as prefix, infix or suffix to the adjectives, verbs, pronouns, adverbs, etc., connected with the substantive. For example, the Avars say: "*Dow tchi wugo roqow*"—this man is in the house; "*Dob keto bugo roqob*"—this cat is in the house; "*Doy thladi Yigo roqoy*"—this wife is in the house. Substantives, adjectives and pronouns are declined; an extraordinary number of cases is used to express ideas that in other languages are expressed by

a combination of words with prepositions. The Tabassaran language has 35 cases. The system of declension is based on the opposition of *Casus Agens* to *Casus Patiens*. The *Casus Agens* is used for the logical subject of transitive verbs, and *Casus Patiens* for the logical object of transitive and logical subject of intransitive verbs. The outward distinction between *Casus Agens* and *Casus Patiens* is expressed in a different way by different substantives. Thus, in the Kuri language *Lam*—"ass"—has *Agens Lamra* and *ghum*—"smoke"—has *Agens ghumadi*. All other cases are derived from the *Agens* by adding different endings. The plural is also formed differently from different substantives, so that the declension of substantives in East Caucasian languages is full of irregularities. The same is true of conjugation in most of these languages. The verbal root, *i.e.*, the invariable part of all verbal forms, consists mostly of one consonant. Before it are the prefixes, indicating the aspect of the verb (*i.e.*, whether the action is considered as a lasting process or as a concluded action) and the gender signs mentioned above agree with the *Patiens* of the sentence. After the root consonant come the elements, indicating time, mood and sometimes the person. There are many verbal forms and the difference of their meaning is often very subtle and difficult to define. The East Caucasian languages have therefore a complicated grammar with a great abundance and prodigality of forms. The same prodigality is found in the vocabulary; there are for instance special adverbs to indicate such notions as "five years ago," "four days later," etc.—these words having nothing in common with the corresponding numerals.

In the West Caucasian languages, declension is reduced to a minimum; the Adyghe and Ubykh languages have only three cases, the Abkhaz has no declension at all. There are fewer verbal forms than in the East Caucasian languages. The vocabulary is poor, so that the simplest notions are expressed by compound words, *e.g.*, in Adyghe the beard is designated as "tail of the mouth," etc. The characteristic peculiarity of West Caucasian languages is a fondness for combining words. Notwithstanding these differences between East and West Caucasian languages, there are still important similarities in both these groups—*viz.*, in the most elementary words, personal pronouns, numerals, simple verb roots, etc., so that there can be no doubt as to their relationship. There are also isolated similarities in the grammar, for instance the opposition of *Casus Agens* to *Casus Patiens*, traces of the different classes of substantives, etc.

The phonetic system of South Caucasian languages is simpler than that of the North Caucasian; there is a striking fondness for the agglomeration of consonants (*e.g.*, the Georgian, *mghwdl* is genit. for "priest"). There is only one gender. The declension is rich in case forms, but their formation is regular. The verb has a developed conjugation; the means of expressing personal forms through combination of certain prefixes and suffixes is complicated. In the South Caucasian languages the agreement of the verb with its subject and object varies with the tenses of the verb. In the present the subject is in the nominative and the object in the dative-accusative. In the Aorist the subject is in a special case (*Agens*?) and the object in the nominative, in the perfect the subject is in the dative and the object in the nominative.

Georgian alone has an ancient written literature, beginning with the 5th century A.D., and in recent years books and newspapers have begun to appear in other Caucasian languages.

BIBLIOGRAPHY.—Literature on North Caucasian languages is to be found in Meillet and Cohen's, *Les Langues du Monde* (Paris, 1924) and A. Ditt, *Einführung in das Studium der Kaukasischen Sprachen* (Leipzig, 1928). For Georgian, A. Ditt, *Theoretisch-praktische Grammatik der modernen Georgischen (Grusinischen) Sprache* (No. 81, Hartleben's *Kunst der Polyglottie* Series); F. N. Fink, *Die Haupttypen des Sprachbaues*, p. 132-149 (Leipzig, 1910). (N. S. T.)

CAUCASUS, a mountain range, stretching north-west to south-east from the Strait of Kerch (between the Black sea and Sea of Azov) to the Caspian sea, over 900m. long and varying from 30 to 140m. in width. In its general uniformity of direction, its comparatively narrow width, and its well-defined limits towards both south and north, it presents a closer analogy with the Pyrenees than with the Alps. The range, like the Pyrenees, maintains for considerable distances a high elevation, and is not cleft by

natural passes, as in the Alps. In both ranges some of the highest summits stand on spurs of the main range, not on the main range itself, e.g., Mts. Elbruz and Kasbek, Dykh-tau, Koshtan-tau, Janga-tau and Shkara. For purposes of description it is convenient to consider the range in four sections, a western, a middle with two subsections and an eastern.

Western Caucasus.—This section, extending from the Strait of Kerch to Mt. Elbruz in $42^{\circ} 40' E.$, is over 420m. long, and runs parallel to the north-east coast of the Black sea and only a short distance from it. Between the main range and the sea there intervene at least two parallel ranges separated by deep glens, and behind it a third subsidiary parallel range, likewise separated by a deep valley, and known as the Bokovoi Khrebet. All these ranges are crossed by numerous glens and gorges, and the rainfall being heavy and the exposure favourable, they are densely clothed with vegetation. Many of the spurs abut steeply upon the Black sea, so that this littoral region is very rugged and not readily accessible. The seaward flanking ranges run up to 4,000ft. and more, and in many places form cliffs which overhang the coast some 2,000–3,000ft., while the main range gradually ascends to 10,000–12,000ft. as it advances east, the principal peaks being Fisht (8,040ft.), Oshten (9,210ft.), Shuguz (10,640ft.), and Psysh (12,425ft.). The main range is built up of hard crystalline rocks, and the subsidiary chains are composed of softer strata (Cretaceous and Tertiary) which are more easily disintegrated. The snowline is about 9,000ft. on the loftiest summits, and east of Oshten the crest of the main range is capped with perpetual snow and carries many hanging glaciers, while larger glaciers creep down the principal valleys. The few passes lie at relatively great altitudes, so that although the northern versants of the various ranges all have a gentle slope, communication between the Black sea and the valley of the Kuban, and the low steppe country beyond, is not easy. The more important passes, proceeding from west to east are Pshekh (5,435ft.), and Shetlib (6,060ft.), Pseashka (6,880ft.), Sanchar (7,990ft.); between the last-named and Elbruz are the passes of Marukh (11,500ft.), Klukhor (9,450ft.) and Nakhar (9,615ft.).

Owing to topographical and climatic conditions the southern exposure fosters a luxuriant and abundant vegetation. The most distinguishing feature of the flora is the predominance of arborescent growths; forests cover 56% of the area and are not only dense but laced together with climbing and twining plants. The commonest species of trees are such as grow in central Europe, viz., ash, fir, pine, beech, acacia, maple, birch, box, chestnut, laurel, holm-oak, poplar, elm, lime, yew, elder, willow, oak. The common box is especially prevalent, but the preponderating species are *Coniferae*, including the Caucasian species *Pinus halepensis* and *P. insignis*. The commonest firs are *Abies nordmannia* and *A. orientalis*. There are two native oaks, *Quercus ponticus* and *Q. sessiliflora*. A great variety of shrubs grow on these slopes of the western Caucasus, chiefly the following species, several of which are indigenous—*Rhododendron ponticum*, *Azalea pontica*, *Aristotelia maqui*, *Agave americana*, *Cephalaria tatarica*, *Cotoneaster pyracantha*, *Citrus aurantium*, *Diospyros ebenum*, *Ficus carica*, *Illicium anisatum*, *Ligustrum caucasicum*, *Punica granatum*, *Philadelphus coronarius*, *Pyrus salicifolia*, *Rhus cotinus* and six species of *Viburnum*. A great variety of aquatic plants thrive excellently. The following purely Caucasian species also grow on the coast—five species of spearwort, three of saxifrage, *Aster caucasicus*, *Dioscorea caucasicus*, *Echinops raddeanus*, *Hedera colchica*, *Helleborus caucasicus* and *Peucedanum caucasicum*. Here too are found magnolia, azalea, camellia, begonia and paulownia. Among the cultivated trees and shrubs the most valuable are the vine, peach, pomegranate, fig, olive (up to 1,500ft. above sea-level), chestnut, apricot, apple, pear, plum, cherry, melon, tea (on the coast

BY COURTESY OF NEAR EAST RELIEF
NATIVE OF THE CAUCASUS

between Sukhum-Kaleh and Batum), maize (yielding the staple food of the inhabitants), wheat (up to 6,000ft.), potatoes, peas, currants, cotton, rice, colza and tobacco. After the Russian conquest half a million of the inhabitants of this region being Mohammedans, and refusing to submit to the yoke of Christian Russia, emigrated into Turkish territory, and the country where they had lived remained for the most part unoccupied until after the beginning of the 20th century. The coast-line is remarkably regular, there being no deep bays and few seaports. The best accommodation that these latter afford consists of more or less open roadsteads, e.g., Novorossiisk, Gelenjik, Anapa, Sukhum-Kaleh, Poti and Batum. Along the coast are summer bathing resorts similar to those of the south-east coast of the Crimea. The largest are Anapa, Gelenjik and Gagry.

Middle Caucasus: (a) Western Half.—This sub-section, having a length of 200m., reaches from Mt. Elbruz to Kasbek and the Pass of Darial. It contains the loftiest peaks of the whole range, of which those above 15,000ft. are:—Elbruz (west peak) 18,465ft. and (east peak) 18,345ft., Jaikyl 17,780ft., Dykh-tau 17,050ft., Shkara 17,040ft., Koshtan-tau 16,875ft., Janga-tau 16,660ft. (west peak) and 16,525ft. (east peak), Kasbek 16,545ft., Mishirghi-tau 16,410ft. (west peak) and 16,350ft. (east peak), Adish or Katuyn-tau 16,295ft., Gestola 15,940ft., Tetnuld 15,920ft., Gimaraï-Khokhr 15,670ft., Ushba 15,410ft. (south-west peak) and 15,400ft. (north-east peak), Ullu-az 15,350ft., Adai-Khokh 15,275ft., Tikhtengen 15,135ft., Tiutiun-tau 15,115ft.

The crest of the main range runs at an altitude exceeding 10,000ft., but is surpassed in elevation by the secondary range to the north, the Bokovoi Khrebet. These ranges are connected by more than half a dozen short transverse spurs enclosing as many cirques. Besides the Bokovoi Khrebet several other short subsidiary ranges branch off from the main range at acute angles, with high glens between them. Down all these glens glacier streams descend, until they find an opportunity to pierce through the flanking ranges, which they do in deep gorges, and then race down the northern slopes of the mountains to enter the Terek or the Kuban, or down the southern versant to join the Rion or the Kura. Amongst all these high glens there is a remarkable absence of lakes and waterfalls; nor are there down in the lower valleys, as one would expect in a region so extensively glaciated, any sheets of water corresponding to the Swiss lakes. In this section of the Caucasus the loftiest peaks do not as a rule rise on the main range, but in many cases on the short spurs that link it with the Bokovoi Khrebet and other subsidiary ranges.

Glaciers.—The snow-line runs at 9,500 to 10,000ft. on the northern face and 1,000ft. higher on the southern face. There are over 900 glaciers in this section, and although they often rival those of the Alps in size, they do not descend generally to such low altitudes. The best known are the Bezingi or Ullu, between Dykh-tau and Janga-tau, 10½m. long, and descending to 6,535ft. above sea-level; Leksyr, situated south of Adyr-su-bashi, 7½m. long, and its end at 5,690ft., the lowest point to which any glacier descends on the south side of the range; Tseyra or Zea, descending 6m. from the Adai-khokh to 6,730ft.; Karagom, from the same mountain, 9½m. long, and reaching down to 5,790ft., the lowest on the northern side; Dyevdorak or Devdorak, from Kasbek, 2½m. long, its end at 7,530ft.; Khaldeh or Gereshe 4½m. long, from Shkara and Janga-tau; Tuyber from Tetnuld, 6½m. long, and reaching down to 6,565ft.; Tsanner or Zanner, the same length, but stopping short 240ft. higher, likewise given off by Tetnuld; while between that peak, Adish and Gestola originates the Adish or Lardkhat glacier, 5m. long and terminating at 7,450ft. The total area covered by glaciers in the central Caucasus is estimated at 625 to 650sq.m., the longest being the Maliev on Kasbek, 36m. long; but according to M. Rossikov several of the largest glaciers are retreating, the Tseyra at the rate of something like 40–45ft. per annum.

Passes.—It is in this section that the mountain system is narrowest, and here (apart from the "gate" at Derbent close beside the Caspian) are the principal north to south communications, between south Russia and Armenia and Asia Minor. These are the passes of Darial and Mamison. Over the former, which lies

immediately east of Kasbek, runs the Georgian military road (1811-64) from Vladikavkaz to Tiflis, cutting through the mountains by a beautiful gorge (8m. long), shut in by mountain walls nearly 6,000ft. high, and so narrow that there is only just room for the road and the river Terek side by side. The pass by which this road crosses the main range farther south is known as the Krestovaya Gora and lies 7,805ft. above sea-level. The Mamison pass, over which runs the Ossetic military road (made passable for vehicles in 1889) from the Terek (below Vladikavkaz) to Kutais in the valley of the Rion, skirting the eastern foot of the Adai-khokh, lies at an altitude of 9,270ft. and is situated a little south of the main range. Horses can traverse only the best of the other passes and only during a few weeks in summer. They range at altitudes of 9,000-12,500ft., and between the pass of Nakhar in the west and that of Mamison in the east there is not a pass below 10,000ft. The best known are Chiper (10,800-10,720ft.), Bassa (9,950ft.), Donguz-orun (10,490ft.), Becho (11,070ft.), Akh-su (12,465ft.), Bak (10,220ft.), Adyr-su (12,305ft.), Bezengi (10,090ft.), Shari-vizk (11,560ft.), Edena, Pasis-mta or Godivizk (11,270ft.), Shtulu-vizk (10,860ft.), Fytnargyn (11,130ft.), Bakh-fandak (9,570ft.), the two Karaul passes (11,680 and 11,270ft.) and Gurdzi-vizk (10,970ft.). The most frequented pass in Svanetia is that of Latpari (9,260ft.), situated in the first of the southern subsidiary ranges mentioned above, and thus connecting the valleys of the Ingur and the Tskhenis-Tskhali.

Flora.—In this section of the range again the southern slopes are clothed with vegetation of remarkable luxuriance and richness, more especially in the region of Svanetia (42°-43° E.). Here again the plants are bigger and the blossoms more abundant than in the Alps, forests of *Coniferae* predominate, and gigantic male ferns (*Aspidium filix-mas*), *Paris incompleta* (a member of the Trilliaceae), *Usnea* or tree-moss, box, holly (*Ilex aquifolium*), *Lilium monadelphum* and many of the herbaceous plants which flower in English gardens, grow here to an extraordinary size—monkshoods, *Cephalaria*, *Mulgedia* and groundsels. Other species are *Campanula*, *Pyrethrum*, aconite, *Cephaelis*, speedwell, *Alchemilla sericea*, *Centaurea macrocephala*, *Primula grandis* and a species of primrose. Flowers of great beauty and abundance blossom up to 13,000ft. on the northern slope and on the southern slope ascend 2,000ft. higher. Walnuts grow up to an altitude of 5,400ft., the vine and mulberry to 3,250ft., the lime and ash to 4,000ft. The forests extend to the upper end of the limestone gorges. Above that the crystalline schists are bare of tree vegetation. The upper limit of arborescent vegetation is 7,000-7,500ft., of shrubs, e.g., rhododendrons, 8,500ft., and of pasture-lands up to 9,000ft. The principal cultivated varieties of plants in this section are wheat, rye, oats, barley, beans, millet and tobacco.

Middle Caucasus: (b) Eastern Part.—In this sub-section, which stretches from Kasbek and the Darial gorge to the Babadagh in 48° 25' E., a distance of 230m., the Caucasus attains its greatest breadth. For the whole distance the main range keeps an average elevation of 10,000ft., though the peaks are 2,000 to nearly 5,000ft. higher, the altitudes increasing towards the east. The glaciers decrease in the same proportion. Here the principal peaks, again found chiefly on the spurs and subsidiary ranges, are the Tsmiakom-khokh (13,570ft.), Shan-tau (14,530ft.), Kidenaismagali (13,840ft.), Zilga-khokh (12,645ft.), Zikari (12,565ft.), Choukhi (12,110ft.), Julti-dagh (12,430ft.), Alakhun-dagh (12,690ft.) and Maghi-dagh (12,445ft.). On the main range stand Borbalo (10,175ft.), Great Shavi-kildeh (12,325ft.), Murov (11,110ft.), Ansal (11,740ft.), Ginor-roso (11,120ft.), while farther east come Trfan-dagh (13,765ft.) and Bazardyuz or Kichen (14,727ft.). In the same direction, but again outside the main range, lie Shah-dagh (13,955ft.), Shalbuz (13,675ft.) and Malkamud (12,750ft.).

The most noteworthy feature of this section is the broad *highland region of Daghestan*, which flanks the main range on the north and sinks down to the Caspian sea (east), and to the valley of the Terek (north). On the north-west this rugged highland region is well defined by the transverse ridge of Andi, which to the east of Kasbek strikes off from the Caucasus range almost at right angles. The rest of the Daghestan region consists of a series of roughly

parallel folds, of Jurassic age, ranging in altitudes from 7,500 up to 12,500ft., separated by deep river glens which cut it up into a number of arid, treeless plateaus. The most prominent of these tablelands is Bash-lam, which stretches east and west between the Chanti Argun and the Andian Koisu. Upon it rise the conspicuous peaks of Tebulos-mta (14,775ft.), Tugo-mta (13,795ft.), Komitotavi or Kachu (14,010ft.), Donos-mta (13,560ft.), Diklos-mta (13,740ft.), Kvavlos-mta or Kolos-mta (13,080ft.), Motshekh-tsferi (13,140ft.) and Galavanas-tsferi (13,260ft.). Farther east is the Bogos tableland, stretching from south-south-west to east-north-east between the Andian Koisu and the Avarian Koisu and rising to over 13,400ft. in several peaks, e.g., Antshovala (13,440ft.), Botshokh-meër (13,515ft.), Kosara-ku (13,420ft.) and Addala-shuogochol-meër (13,580ft.); and the Dyulty tableland reaching 12,400ft. between the Kara Koisu and the Kazikumukh Koisu. Nêvé and glaciers occur on some of these peaks, particularly on the slopes of Diklos-mta, where the glaciers descend to 7,700ft. (north) and to 8,350ft. (south). Here the passes are lower than those between Elbruz and Kasbek, though at appreciable heights, fully equal to those that lead up from the Black sea to the valley of the Kuban in the western section of the range. The best known are the Krestovaya Gora (7,805ft.) on the Georgian military road south of Darial; Kodor (9,300ft.) and Satskheni, and Gudur (10,120ft.) and Salavat (9,280ft.), carrying the Akhty military road.

The *flora* of this section bears a general resemblance to that farther west. Ample details will be found in Dr. G. Radde's (1831-1903) monographs on Daghestan.

Eastern Caucasus.—This section of the Caucasus gradually dies away east of Baba-dagh (11,930ft.) towards the Caspian, terminating finally in the peninsula of Apsheron. It is, however, continued under the waters of the Caspian and reappears on its eastern side in the Kopet-dagh, which skirts the north-eastern frontier of Persia. In this section of the Caucasus no peak exceeds 9,000ft. in altitude and the crest of the main range retains no snow. The most frequented pass is Alty-agach (4,355ft.).

Between the northern and the southern sides of the range there is a great difference in climate, productions and scenery. In the south-western slopes and valleys where a heavy rainfall is combined with a warm temperature, magnificent forests clothe the mountain-sides and reach the waters of the Black sea. There the littoral from, say, Sukhum-kaleh to Batum, and the inland parts of the basin of the Rion, will bear comparison with any of the provinces of Italy in richness and variety of products. But farther inland, east of Tiflis, a great change becomes noticeable on the other side of the transverse ridge of the Suram or Meskes mountains. Arid upland plains and parched hillsides take the place of the rich verdure and luxuriant arborescent growth of Imeretia, Svanetia and Mingrelia, the districts which occupy the valleys of the Ingur and Rion and the tributaries of the latter. A very similar change likewise becomes noticeable in the higher regions of the Caucasus mountains north of the pass of Mamison. The valleys of the Rion and Ardon and of others that flow in the same direction, are almost wholly destitute of trees, but where the bare rock does not prevail, the mountain slopes are carpeted with grass. "Treeless valleys, bold rocks, slopes of forbidding steepness (even to eyes accustomed to those of the Alps), and stone-built villages, scarcely distinguishable from the neighbouring crags" (Freshfield). Austere and unattractive though those valleys are, the same epithets cannot be applied to the deep gorges by which in most cases the streams make their escape through the northern subsidiary range. These defiles are declared to be superior in grandeur to anything of the kind in the Alps. That of Darial (the Terek) is fairly well known, but those of the Cherek and the Uruk, farther west, are stated to be still more magnificent. Not only do the snow-clad ranges and the ice-panoplied peaks surpass the loftiest summits of the Alps in altitude; they also in many cases excel them in boldness and picturesqueness of outline, and equal the most difficult of them in steepness and relative inaccessibility.

Hydrography.—Nearly all the larger rivers of Caucasia have their sources in the central parts of the Caucasus range. The torrential streams of Mdzimta, Pzou, Bzyb and Kodor drain the

country west of Elbruz. The Ingur, Tskhenis-Tskhali, Rion and its tributaries, e.g., the Kvirila, are longer but also in part torrential; they drain the great glacier region between Elbruz and Kasbek. The Rion is the *Phasis* of the ancients and flows through the classic land of Colchis. The Lyakhva and Aragva, tributaries of the Kura, carry off the waters of the main range south of Kasbek, and other tributaries, such as the Yora and the Alazan, collect the surplus drainage of the main Caucasus range farther east. The other large river of this region, the Aras, has its sources, not in the Caucasus range, but on the Armenian highlands a long way south-west of Ararat. The rivers which go down northwards from the central Caucasus have longer courses than those on the south. The most important of these are the Kuban and the Terek; most of the streams which have their sources among the central glaciers draining into the latter, e.g., the Malka, Baksan, Chegem, Cherek, Uruk, Ardon. The Kuma, which alone pursues an independent course through the steppes, farther north than the Terek, has its sources, not in the main ranges of the Caucasus, but in a group of mountains near Pyatigorsk. Its waters become absorbed in the sands of the desert steppes before they reach the Caspian. Of the streams that carve into chequers the elevated plateau of Daghestan, four, known by the common name of the Koisu, unite to form the Sulak. The only other stream deserving of mention in this province is the Samur. Both rivers discharge their waters into the Caspian, as also does the Zumgail, a small stream which drains the eastern extremity of the Caucasus range.

Volcanic Evidences.—Ancient but now extinct volcanic centres occur frequently at the intersections of the main range with the transverse ranges; of these the most noteworthy are Elbruz and Kasbek. The town of Shemakha near the eastern end of the system was the scene of volcanic outbreaks as late as 1859, 1872 and 1902; while in the adjacent peninsula of Apsheron mud volcanoes exist in large numbers. All along the northern foot of the system hot mineral springs gush out at various places, such as Pyatigorsk, Zhelesnovodsk, Essentuki and Kislovodsk; and the series is continued along the north-eastern foot of the highlands of Daghestan, e.g., Isti-su, Eskiendery, Akhta. Also similar evidences of volcanic activity characterize the northern border of the Armenian highlands on the southern side of the Rion-Kura depression, in the mountains of Ararat, Alagöz, Akmangan, Samsar, Godoreby, Great and Little Abull, and in the mineral springs of Borzhom, Abbas-tuman, Sleptzov, Mikhailovsk and Tiflis.

Geology.—The structure of the Caucasus is comparatively simple, and in the form of a fan. In the centre are crystalline rocks which disappear towards the east. Beneath them, on both sides, plunge the strongly folded Palaeozoic and Jurassic schists. On the north the folded beds are followed by a zone of Jurassic and Cretaceous beds which rapidly assume a gentle inclination towards the plain. On the south the corresponding zone is affected by numerous secondary folds which involve Upper Miocene deposits. In the east, the structure is somewhat modified. The crystalline band is lost. The northern Mesozoic zone is very much broader, and is thrown into simple folds like those of the Jura mountains. The Mesozoic zone is absent in the south, and the Palaeozoic zone sinks abruptly in a series of faulted steps to the plain of the Kura, beneath which no doubt the continuation of the Mesozoic zone is concealed.

The geological sequence begins with the granite and schists of the central zone, which extend from Fisht (west) to some distance beyond Kasbek (east). Then follow the Palaeozoic schists and slates. Fossils are extremely rare in these beds; *Buthotrephis* has long been known, and traces of *Calamites* and ferns, and in the west fossils which appear to indicate a Devonian age. Upon the Palaeozoic rest Mesozoic deposits (Lias to Upper Cretaceous). Different views exist as to the position of unconformities, but important ones occur at the base of the Tithonian (Upper Jurassic) and at the base of the Trias. In general the Upper Jurassic beds are much more calcareous on the north than they are on the south. The Mesozoic are followed by Tertiary deposits, which on the north are nearly horizontal but on the south are in part included in the folds—the Eocene and Miocene being folded, while later beds, though sometimes elevated, may not be affected

by the folding. The final folding of the chain, proceeding from north-east, undoubtedly occurred at the end of the Miocene period. Folding also occurred probably during the Permian and again during the Upper Jurassic (direction south-west). Also the difference in character of the Jurassic beds on the two sides of the chain appears to indicate that a ridge existed in that period. The last phase in the history of the Caucasus was the growth of the great volcanoes of Elbruz and Kasbek, which stand upon the old rocks of the central zone, and by the outflow of sheets of lava upon the sides of the chain. The cones are composed largely of acid andesites, but many of the lavas are augite andesites and basalts. There seem to have been two periods of eruption, and as some of the lavas have flowed over Quaternary gravels, the latest outbursts must have been of very recent date.

Near the northern foot of the Caucasus, especially near the hot mineral springs of Pyatigorsk, a group of igneous rocks rises above the plain. They are laccolites of trachytic rock, and raised the Tertiary beds above them in the form of blisters. Subsequent denudation has removed the sedimentary covering and exposed the igneous core. Petroleum occurs in the Tertiary beds at both ends of the chain.

Freshfield, *Exploration of the Caucasus* (2nd ed., 1902, 2 vols.); H. Abich, *Aus Kaukasischen Ländern* (2 vols., 1896); C. von Hahn, *Kaukasische Reisen und Studien* (1896) and *Bilder aus dem Kaukasus* (1900); G. Merzbacher, *Aus den Hochregionen des Kaukasus* (2 vols., 1901); J. Mourier, *L'Art au Caucase* (new ed., 1912); E. A. Martel, *La Côte d'Azur russe* (1909); S. Graham, *A Vagabond in the Caucasus* (1911); A. Herbert, *Casuals in the Caucasus* (1912); M. Rikli, *Natur und Kulturbild der Eiszeit im Kaukasus* (1914); M. Varandian, *La confit arméno-géorgien et la guerre du Caucase* (1919); A. Dirr, *Caucasian folk-tales* (1925). The geology of the Caucasus is dealt with in E. Fournier, *Description géologique du Caucase central* (1896); F. Löwinson-Lessing, *Guide des Excursions du VII^e Congrès géol. internat.* (1897); and F. Oswald, *Notes on the Geological Map of the Caucasus* (1914). *A travers le Caucase* (1905) by E. Levier is especially valuable for botany and N. Y. Dinnik writes on the fauna in *Bull. Soc. Impériale des Naturalistes de Moscou* (1901). Much valuable information about the Caucasus is preserved in *Izvestia and Zapiski* of the Russian and Caucasian geographical societies. V. Dingelstedt has a number of papers on this region in the *Scottish Geographical Magazine* (1889–1904). A useful geological map is by F. Oswald (1914), scale of 1:1,000,000; and the Russian general staff have a good map on the scale of 1:210,000. (J. I. P.)

HISTORY

To the ancient Greeks Caucasia, and the mighty range which dominates it, were a region of mystery and romance. It was there that they placed the scene of the sufferings of Prometheus (*vide* Aeschylus, *Prometheus Vincitus*), and there, in the land of Colchis, which corresponds to the valley of the Rion, that they sent the Argonauts to fetch the golden fleece. Outside the domain of myth, the earliest connection of the Greeks with Caucasia would appear to have been through the maritime colonies, such as Dioscurias, which the Milesians founded on the Black sea coast in the 7th century B.C. For more than two thousand years the most powerful state in Caucasia was that of Georgia (*q.v.*). The southern portion of Transcaucasia fell during the 1st century B.C. under the sway of Armenia, and with that country passed under the dominion of Rome, and so eventually of the Eastern empire. During the 3rd century A.D. Georgia and Armenia were invaded and in great part occupied by the Khazars, and then for more than a thousand years the mountain fastnesses of this borderland between Europe and Asia were the refuge, or the resting-place, of successive waves of migration. The Huns and the Avars appeared in the 6th century, and the Mongols in the 13th. In the 10th century bands of Varangians or Russified Scandinavians sailed out of the Volga and coasted along the Caspian until they had doubled the Apsheron peninsula, when they landed and captured Barda, the chief town of Caucasian Albania.

But, apart from Georgia, historical interest in Caucasia centres in the long and persistent attempts which the Russians made to conquer it, and the heroic, though unavailing, resistance offered by the mountain races, more especially the Circassian and Lesghian tribes. Russian aggression began early in the 18th cen-

tury, when Peter the Great, establishing his base at Astrakhan on the Volga, and using the Caspian for bringing up supplies and munitions of war, captured Derbent from the Persians in 1722, and Baku in 1723. But these conquests, with others made at the expense of Persia, were restored to the latter power after Peter's death, a dozen years later. At that period the Georgians were divided into various petty principalities, the chief of which were Imeretia and Georgia (Kharthlia), owing at times a more or less shadowy allegiance to the Ottoman sultan. In 1770, when at war with Turkey, the Russians crossed over the Caucasus and assisted the Imeretians to resist the Turks, and from the time of the ensuing peace of Kuchuk-kainarji the Georgian principalities looked to Russia as their protector against the Turks. In 1783 George XIII., prince of Georgia and Mingrelia, formally put himself under the suzerainty of Russia, and after his death Georgia was converted (1801) into a Russian province. The same fate overtook Imeretia nine years later. Meanwhile the Russians had also subdued the Ossetes (1802) and the Lesghian tribes (1803) of the middle Caucasus. By the peace of Gulistan in 1813 Persia ceded to Russia several districts in Eastern Caucasia, from Lenkoran northwards to Derbent. Nevertheless the mountain tribes were still independent, and their subjugation cost Russia a sustained effort of thirty years. At first the Russians were able to continue their policy of conquest and annexation without serious check. After acquiring the northern edge of the Armenian plateau, partly from Persia in 1828 and partly from Turkey in 1829, Russia in 1832 crushed a rising in Daghestan. The next seven years were occupied with the subjugation of the Abkhassians along the Black sea coast, and of other Circassian tribes in the west. Meanwhile Shamyl, a chief and religious leader of the Lesghians, had roused the Lesghian tribes farther east. His resistance was finally broken after 20 years of warfare by Prince Baryatinsky, who succeeded in capturing Shamyl's stronghold of Weden, and then in surrounding and capturing (1859) that chieftain himself on the inaccessible rocky platform of Gunib in the heart of Daghestan. But it was not until 1864 that the Russians finally stifled all opposition. Then followed a wholesale emigration of the Circassians, who sought an asylum in Turkish territory, leaving their native region almost uninhabited and desolate. During the Russo-Turkish War of 1877-78 the self-exiled Circassians and other Caucasian mountaineers, supported by a force of 14,000 Turks, made a determined attempt to wrest their native glens from the power of Russia; but, after suffering a severe defeat at the hands of General Alkhazov, the Turks withdrew, and were accompanied by some 30,000 Abkhassians, who settled in Asia Minor. A few months later the Lesghians in Daghestan, who had risen in revolt, were defeated and their country once more reduced to obedience. By the peace of Adrianople, Russia still further enlarged her Transcaucasian territories by the acquisition of the districts of Kars, Batum and Ardahan. After a peaceful period of a quarter of a century the Armenian subjects of Russia in Transcaucasia were filled with bitterness and discontent by the confiscation of the properties of their national (Gregorian) Church by the Russian treasury. Nor were their feelings more than half allayed by the arrangement which made their ecclesiastics salaried officers of the Russian state. This ferment of unrest, which was provoked in the years 1903-04, was exacerbated by the renewed outbreak of the century-long racial feud between the Tatars and the Armenians, at Baku and other places. Nearly the whole of the region between the Caucasus and the Perso-Turkish frontier on the south, from the Caspian sea on the one side to the Black sea on the other, was embroiled in a civil war of the most sanguinary and ruthless character, the inveterate racial animosities of the combatants being in both cases inflamed by religious fanaticism. An end was put to these disorders only by the mutual agreement of the two contestants in Sept. 1905.

The Revolution of 1905 in Russia aroused the desire for self-government that has never long been dormant in the Caucasus. The agrarian policy of the Tsarist Government added fuel to the fire of discontent, and the refusal to recognize their individual national languages was a further source of grievance to Armenians, Tatars and Georgians alike. Nevertheless the Russian Govern-

ment ruthlessly pursued its repressive policy. On the outbreak of the World War in 1914, when they had learnt that Russia was the ally of France and Great Britain, the Caucasian nationalities eagerly responded to the call to arms. But even this action had no effect upon the Russian Government, and the governorship of General Yudenitch was specially noteworthy for its severity. Hence the February Revolution of 1917 was hailed with joy throughout the Caucasus when the individual nationalities attempted to establish a Federal republic that should be governed by a Transcaucasian diet. But the failure of Kerensky's administration and the triumph of Bolshevism spelt failure for the Caucasian Republic also. The component states made a brief attempt to preserve their independence of Moscow under mildly socialistic forms of government, but the military strength of the Soviet soon overcame their resistance. First one and then another was overrun and conquered, and Soviet republics set up under the guidance of Moscow. Despite the maintenance by the Moscow Government of these republics in the Caucasus, the desire amongst some of the population for complete independence of the U.S.S.R. has not been extinguished.

CAUCASUS, CAMPAIGN IN THE. Though both Russian and Turk spoke of a "Caucasus front" and gave to their armies engaged on this front the designation "Caucasian," in the World War, the operations actually took place at a considerable distance from the Caucasus.

The Terrain Described.—The main theatre of these operations may be defined as lying within the following limits; on the east, Batum (on the Black sea)-Kars-Mount Ararat; on the south, Lake Van-Mush-Kharput; on the west, Kemath-Erzinjan-Kiresün; and on the north, the south coast of the Black sea. The whole of this region is covered by the historical term Armenia—not merely the present republic of that name, but, in the wider sense of the term, the country which was inhabited in 1914 largely by the ill-starred Armenian nation. Outside this main theatre of operations, a somewhat desultory warfare was carried on by detachments from the main forces up and down the western parts of Persia. Though some of the valleys are fertile, the area as a whole is bleak, sparsely populated and almost undeveloped.

The poverty of the communications and the severity of the climate render military operations on a large scale difficult and arduous. In 1914, on the Russian side, railway communication ended at Sari Qamish, some 40m. southwest of Kars and 15 from the frontier; on the Turkish side, 600m. of indifferent roads and tracks separated their armies operating in the Erzerum area from the nearest railhead at Angora or Ulu Qishla, on the Baghdad railway northwest of Adana. Thus the advantage in land communications lay, at the outset, very decidedly with the Russians, who had also, except for a short period after the outbreak of War, command of the Black sea. On neither side, however, could the communication be considered in any way adequate for operations on the grand scale.

Few commanders would welcome a campaign in such extreme conditions of climate and difficulties of movement and supply. Neither army was up-to-date in its technical organization. The higher leading and staff work in both armies was rough and ready rather than scientific, though there were a number of German staff officers with the Turk and many highly educated and intelligent men in the Russian General Staff. Given the characteristics of the two armies and the restrictions to manoeuvre which the terrain imposed, it was sufficiently obvious that the campaigns were likely to be marked by hard, straightforward fighting rather than any striking display of military art. Only the hardest of soldiers could have come to grips with each other at all in that waste of snow-clad hills, in the depths of winter when the campaign opened. It was at the end of October 1914, that Turkey definitely entered the World War on the side of the Central Powers, and opened hostilities by naval bombardment of Russian ports in the Black sea.

The strategy of the Central Powers would have naturally dictated as the most useful contribution of her new ally to the common effort a diversion likely to withdraw most Russian troops from the hard-pressed Austrians; and Liman von Sanders, the

chief of the German Military Mission in Turkey, is known to have proposed a scheme for the landing of a Turkish force at Odessa with this object. But this scheme, even apart from doubts whether command of the Black sea could be effectively secured, was, perhaps not unnaturally, viewed with disfavour by the Turks, who preferred the hope of reconquest of some of the territory, notably the fortress of Kars, lost to Russia in previous wars. The III. Turkish Army had been assembling during Sept. and Oct. in the neighbourhood of Erzerum. It consisted of the IX. and XI. Corps, the 2nd Cav. Div. and some mounted irregulars. During Nov. the X. Corps was added, bringing the fighting strength of the army up to approximately 100,000 men. All three corps were composed mainly of Anatolians, the best fighting material in Turkey.

The Turkish Plan of Campaign.—The plan evolved by Enver, whose megalomaniac mind seems to have dreamed of campaigns rivalling those of Alexander and extending even up to India, was a wide enveloping movement with Kars as the objective. The XI. Corps was to attack frontally toward the Russian railhead at Sari Qamish, while the IX. and X. Corps moved north from Erzerum, swept by difficult hill passes through Olti, on toward Kars and Sari Qamish. Still further north, a detachment which had landed at Trebizond was to advance on Ardahan. This grandiose plan wholly ignored the absence of communications and the climatic conditions. The Russian attitude was, at the outset, purely defensive; their main preoccupation was on their Western Front, which had absorbed nearly all the available forces; two of the three regular corps, stationed in the Caucasus in peace, had been sent on mobilization to defend the Western Front against Austria and Germany. Only two complete corps, the I. Caucasian and II. Turkestan, were at first available for the defence of the Caucasus. Yet the Russians made the first advance, moving a force across the frontier in Köpri Köi on the road to Erzerum. This advance was made to secure room for manoeuvre in front of the important base at Sari Qamish. The Turks promptly attacked, and some fierce fighting took place between Nov. 8 and 20, which ended in the withdrawal of the Turks.

Enver now arrived from Constantinople and assumed personal command of the III. Army. He insisted, against the views of his German advisers, on putting into execution the ambitious plan he had conceived. The routes by which the turning movement was made were mere mountain tracks deep in snow; the greater part of the artillery and transport had to be left behind, and the attempt seemed madness. Yet such fortitude and endurance did the poorly equipped and ill-fed Turkish troops display that they almost achieved the impossible. While the main Russian body was engaged with the XI. Corps, the IX. Corps appeared, in the last days of Dec., on the heights above Sari Qamish, and the X. Corps on its left approached the railway between Kars and Sari Qamish; the detachment from Trebizond had already driven the Russians out of Ardahan.

The Russian commander's nerve failed him at the crisis; and the situation was saved only by his chief of the staff, Gen. Yudenich, a man of considerable ability and imperturbable resolution. He collected forces for a counter attack, which resulted in the complete defeat and practical annihilation of the two Turkish turning corps, worn out and disorganized by their formidable approach march; the XI. Corps was then in its turn driven back. The total losses of the Turkish III. Army are said to have approximated to 85%. Enver at once handed over the command to Hawis Hakki Pasha and returned to Constantinople. Hawis Hakki died shortly after, and the command was given to Mahmoud Kiamil. The alarm caused in Russia by the Turkish incursion was such that an appeal was made to Great Britain for a diversion against the Turks. This led to the first suggestion for the Gallipoli expedition.

During the whole of 1915 the fighting on the Caucasus front was of minor importance only. The main preoccupation of the Russians lay on their Western Front, of the Turks in Gallipoli. The shattered III. Army was gradually reconstituted, and the Russians raised fresh units to increase their strength. But neither side was yet in shape for a serious offensive. The detachment of Turks which in the previous winter had advanced to Ardahan and

then had been driven back to Artvin, attempted in April a *coup de main* against Batum, but without success. On the other flank the Russians advanced their left wing into Armenia during May and June, occupied Van and threatened Bitlis. The Armenian rising which assisted the Russians led to bloody reprisals on their compatriots still in Turkish power. In Sept. 1915 the Grand Duke Nicholas took over command of the Caucasus front, an event which was to produce a marked enlargement of the Russian effort in this theatre. Grand Dukes in Imperial Russia could still obtain reinforcements in men and material denied to ordinary commanders. Nor did the character of the Grand Duke make it likely that he would adopt a passive rôle. Though not a great strategist, he was shrewd and energetic, as he had already shown while in command on the Western Front, a most loyal and unselfish supporter of the Allied cause. He found an able executive commander in Gen. Yudenich, already mentioned.

The Taking of Erzerum.—Once again an offensive on a large scale was made in the depth of winter. The Grand Duke wished to anticipate the arrival of Turkish reinforcements released by the British evacuation of Gallipoli. This enterprise was completely successful. The Russian capture of Erzerum was one of the finest feats of arms of the whole War. Its assault did not form part of the original plan, but the attacks up the Araxes valley, begun on Jan. 11, 1916, so completely surprised the Turk that it was decided to attempt it. The famous fortress, though many of the works and much of the armament were not modern, occupies a position of great natural strength, which the Turks under German supervision had improved with field works in addition to the existing forts. Its capture on Feb. 16 was mainly the result of a turning movement from the north, made by the II. Turkestan Corps under Przhevalski, the ablest of the Russian Corps commanders on the Caucasus front, who had an intimate knowledge of Erzerum, where he had spent 15 years as military attaché. The Turks retired in considerable disorder with heavy losses in men and material.

The next Russian objective was Trebizond; its capture in April considerably simplified the supply problem. Meanwhile, the Turkish Higher Command, alarmed at the fall of Erzerum and continued advance of the Russians, had decided on a counterstroke. They ordered the assembly of a new army, the II., under Izzet Pasha, in the Mush-Kharput region, to attack the Russian flank and rear and recapture Erzerum. The plan was sound enough, had the communications allowed of a speedy concentration and swift advance. But the assembly of the II. Army, begun in April, was not complete in July. The Grand Duke became aware of the Turkish intentions and anticipated their attack by a heavy blow at the III. Army, which eventually broke in complete rout. The Russians occupied Erzinjan in July. So heavy were the losses of the III. Army that it had subsequently to be completely reorganized. To do this divisions were formed out of army corps, regiments out of divisions, battalions out of regiments.

The defeat of the III. Army delayed and weakened the counterstroke of the II. Army, which did not take place till August, giving the Russians time to transfer troops from their right wing to meet it. After some heavy fighting on the Oghnat-Kighi front the II. Army's effort was definitely held. It had gained little ground at a considerable sacrifice in men. Both armies then took up defensive positions for the winter. The line now ran approximately from Tireboli on the Black Sea, west of Gumushkane to Kemakh, then south-east by Kighi, Oghnat, Mush and Bitlis to Lake Van. Further east, on the Turko-Persian border and in Persia, both armies had detachments to protect their flank, and fighting took place with varying fortune during 1915-16.

During the winter of 1916-17 no movements took place. The Turkish II. and III. Armies (Mustapha Kemal and Wahib Pasha respectively), now combined under Izzet Pasha, suffered terrible privations from lack of supplies and the weather. Nor were the Russians very much better off. A light line was being built from Sari Qamish to Erzerum, but progress was very slow and railhead was still some miles short of Erzerum in March 1917. Their command of the sea enabled them to feed their right wing from Trebizond; but from Erzerum and Trebizond to the front,

supply was dependent on horse transport over indifferent tracks, sometimes closed for days by blizzards of snow. The Russians, too, suffered severely from poor rations and typhus.

Attempted Russo-British Co-operation.—In Dec. 1916 the British Army in Mesopotamia, under Gen. Maude, commenced the attacks on the Turks at Kut, which were eventually to lead to the capture of Baghdad in March. Unsuccessful efforts had previously been made to concert the operations of the British in Mesopotamia and the Russians in the Caucasus; and now, with the approach of Maude's forces to Baghdad, an opportunity for effective combination seemed to have arrived. It was agreed that the Cavalry Corps of Baratov from Persia and of Chernozubov from between lakes Urmia and Van (both these corps, though composed mainly of cavalry, had a strong backing of infantry and artillery) should advance on Mosul; and thus, it was hoped, in co-operation with Maude, finally liquidate the Mesopotamian campaign. However, it was not to be. The Grand Duke adopted the plan wholeheartedly, and the Turk would not have been in a position to offer effective resistance. But, first of all, the weather conditions and the difficulty of organizing a line of supply through the mountains of the Persian border caused delay; then, before the movement had well begun, the Russian revolution broke out. With the recall of the Grand Duke toward the end of March—only to be described as an incredible blunder on the part of Kerenki—the best hope of energetic action had gone.

Collapse of the Russian Army.—Throughout the summer the Russian Army lay inactive, gradually disintegrating; by the early autumn it was sufficiently obvious that the troops would make no further forward movement, and could only be relied on to hold their positions so long as they were not attacked. Yudenich, who had succeeded the Grand Duke, gave up the command in August and was succeeded by Przhevalski. But the end was near. In December an armistice was concluded on the Caucasus front, and in Jan. 1918, after the peace of Brest-Litovsk, the Russian troops still remaining retired. The condition of the Turkish armies had been too wretched to allow them up till now to take advantage of the Russian collapse; but when the Russians finally retired, the Turks were once more fired with hopes of territorial gains; and advanced on the Caucasus with troops which from the military point of view would have been more profitably employed in strengthening their front in Palestine. They occupied Batum on April 14 and Kars on the 26th. All Russian regular troops had disappeared, and their only opponents were Georgian and Armenian bands defending their homes.

The British Expedition to Baku.—The British General Staff, alarmed at the prospect of a Caucasus under Turkish control being used as a base of propaganda and even operations against India, had meanwhile organized a group of British officers and non-commissioned officers under Gen. Dunsterville to be sent to the Caucasus to rally the local Armenian and Georgian populations against the Turk. But this force, dispatched through Persia from Mesopotamia, was delayed by the anarchic conditions which followed the collapse of the Russian forces in Persia, and arrived too late. When it reached Baku in August, things had gone too far; and after a short but gallant defence it was compelled to withdraw. But the Turkish control of Trans-Caucasia was short-lived, for Allenby's crushing victory in Palestine a month later spelt the loss of the war for the Turks.

Criticisms of the Campaign.—The operations of the so-called "Caucasus Front" described above thus led to no decisive results on either side. In view of the poor means of communication in the theatre of operations it is difficult to see how decisive results could have been expected. The lure of territorial conquest and false strategical conceptions led the Turks to attach an undue importance to this front, which had disastrous consequences for them from a military point of view. The unnecessarily heavy losses in their best troops caused by the offensives of the III. Army at the end of 1914 and of the II. Army in 1916 caused the weakness which proved their undoing on the Palestine and Mesopotamian fronts. Had the Turks been content with a defensive attitude on the Caucasus Front, British difficulties in these theatres might have been greatly increased.

The purely defensive attitude which the Russians took up at the outset was strategically correct; they had no other objective than the protection of their Transcaucasian provinces from invasion; the state of the communications would obviously never allow them to penetrate far enough into Asia Minor to produce any decisive effect on Turkey. That they advanced as far as they did—farther, perhaps, than was strategically wise—was due to the influence and energy of the Grand Duke. From the military point of view these campaigns are likely to be remembered only for one great feat of arms—the boldness and endurance displayed in the capture of Erzerum—and as affording to soldiers one more example of the dependence of strategy on communications.

(A. P. W.)

CAUCHON, PIERRE, French ecclesiastic, was born near Reims and became bishop of Beauvais in 1420. About ten years later he joined the English faction in France, and his chief title to fame is that he presided over the trial of Joan of Arc at Rouen. Recent researches show that he did so in a spirit of great justice and impartiality, and it must be remembered that he did not condemn the Maid to death but only to imprisonment for life. The death sentence was passed by the civil court. In 1432 he became bishop of Lisieux, and took part in the Council at Basle in 1435. He died in 1442, and was subsequently excommunicated by Calixtus IV.

BIBLIOGRAPHY.—See Cerf, *Pierre Cauchon de Sommièvre, chanoine de Reims et de Beauvais, évêque de Beauvais et de Lisieux, son origine, ses dignités, sa mort et sa sépulture*, in the Transactions of the Academy of Reims (1896-98); A. Sarrazin, *Pierre Cauchon* (1901); Anatole France, *Jeanne d'Arc* (1908).

CAUCHY, AUGUSTIN LOUIS, BARON (1789-1857), French mathematician, was born in Paris, on Aug. 21, 1789, and died at Sceaux (Seine) on May 23, 1857. He studied at the École Polytechnique and the École des Ponts et Chaussées, and practised for some time as an engineer. His health failed in 1813, and his father's friends, Lagrange and Laplace, persuaded him to devote himself entirely to mathematics. From 1816 onwards he held three professorships in Paris, which he lost at the revolution of 1830, on declining to swear allegiance to Louis Philippe. A chair of mathematical physics was created for him at the University of Turin. He spent some time travelling with the duke of Bordeaux, grandson of Charles X., and in 1838 returned to France, resuming his chair at the École Polytechnique.

The genius of Cauchy was promised in his simple solution of the problem of Apollonius; i.e., to describe a circle touching three given circles, which he discovered in 1805, and in his generalization of Euler's theorem on polyhedra in 1811, etc. More important is his memoir on wave-propagation which obtained the *grand prix* of the Institut in 1816. His greatest contributions to mathematical science characterized by the clear and rigorous methods which he introduced and are mainly embodied in his three great treatises, *Cours d'analyse de l'École Polytechnique* (1821); *Le Calcul infinitésimal* (1823); *Leçons sur les applications du calcul infinitésimal à la géométrie* (1826-28). He clarified the principles of the calculus by developing them with the aid of limits and continuity, and was the first to prove Taylor's theorem rigorously, establishing his well-known form of the remainder. In mechanics, he made many researches, substituting the notion of the continuity of geometrical displacements for the principle of the continuity of matter. In optics, he developed the wave theory, and his name is associated with the simple dispersion formula. In elasticity, he originated the theory of stress, and his results are nearly as valuable as those of S. D. Poisson. His collected works, *Œuvres complètes d'Augustin Cauchy*, have been published in 27 volumes.

See C. A. Valsen, *Le Baron Augustin Cauchy: sa vie et ses travaux* (1868).

CAUCUS, a political term used in the U.S.A. of a special form of party meeting, and in Great Britain of a system of party organization. The word originated in Boston (Mass.), in the early part of the 18th century, when it was used as the name of a political club, the "Caucus" or "Caucas" club. Here public matters were discussed, and arrangements made for local elections and the choosing of candidates for offices. A contemporary reference to the club occurs in the diary of John Adams in 1763;

but William Gordon (*History of the Independence of the United States of America*, 1788) speaks of the Caucus as having been in existence some fifty years before the time of writing (1774) and describes the methods used for securing the election of the candidates. The derivation of the word has been much disputed. The most plausible origin is an Algonquin word, *kaw-kaw-was*, meaning to talk, Indian words and names having been popular in America as titles for societies and clubs; cf. "Tammany." In the United States "caucus" is used strictly of a meeting either of party managers or of duty voters, as for instance, a "nominating caucus," for nominating candidates for office or for selecting delegates for a nominating convention. The caucus of the party in Congress nominated the candidates for the offices of president and vice-president from 1800 till 1824, when the convention system was adopted. At the same time, the candidates for governor and lieutenant governor were nominated by the party members of the state legislatures in what was known as the "legislative nominating caucus." Occasionally districts unrepresented in the legislature sent delegates to sit in with the members of the legislature when these nominations were made and this was termed the "mixed legislative nominating caucus." (See CONVENTION; CONVENTION, NATIONAL and PRIMARY, DIRECT.) The word is also used to denote meetings of the members of a party in Congress, a legislature or a city council, to determine matters of party policy on proposed legislation or legislative offices. "Caucus" first came into use in Great Britain in 1878 in connection with the organization of the Liberal Association of Birmingham by Mr. Joseph Chamberlain and Mr. F. Schnadhorst on strict disciplinary lines, more particularly with a view to election management and the control of voters, which became the model for other Liberal associations throughout the country. It was to this supposed imitation of the American political "machine" that Lord Beaconsfield gave the name "caucus," and the name came to be used, not in the American sense of a meeting, but of a closely disciplined system of party organization, chiefly as a stock term of abuse applied by politicians of one party to the controlling organization of its opponents.

CAUDEBEC-EN-CAUX, a town of France, in the department of Seine-Inférieure, 27 m. W.N.W. of Rouen by rail. Pop. (1926) 2,019. It is situated on the right bank of the Seine, the tidal wave of which (*marcaget*) can be well seen. The chief interest of the town lies in its Flamboyant church (15th and 16th centuries). Round its top run balustrades formed of Gothic letters, which read as part of the Magnificat. Its west portal, the decoration of the spire of the tower, and its stained glass are noteworthy features. The town is the old capital of the Pays de Caux. It has some river trade in coal and farm-produce.

CAUDINE FORKS, the *furculae Caudinae* (Casale di Forchia?), narrow passes in the mountains near Caudium in Samnium, and the scene of a famous Roman defeat in the Samnite wars. (See *ROME, History*.)

CAUL, a close-fitting woman's cap, especially one made of network worn in the 16th and 17th centuries; hence the membranous covering to the heart, brain, or the intestines, and particularly, a portion of the *amnion*, which is sometimes found remaining round the head of a child after birth. To this, called in Scotland "sely how," holy or lucky hood, many superstitions have been attached; it was looked on as a sign of good luck, and when preserved, was kept as a protection against drowning.

CAULAINCOURT, ARMAND AUGUSTIN LOUIS, MARQUIS DE (1772-1827), French general and diplomatist, was born at Caulaincourt on Dec. 9, 1772, of a noble family. He early entered the army, did not emigrate in the revolution, but was deprived of his grade as captain in 1793, and served in the ranks. In 1795, through the protection of L. Hoche, he became captain again, was colonel in the Army of the Rhine in 1799-1800, and after the peace of Lunéville (1801) was sent to St. Petersburg (Leningrad) to negotiate an understanding between Russia and France. On his return he was named aide-de-camp of the First Consul. He was employed to seize some agents of the English government in Baden in 1804, which led to the unfounded accusation that he was concerned in the arrest of the duc d'Enghien. He received the title of duke of Vicenza (1808). Napoleon sent him in 1807 as

ambassador to St. Petersburg (Leningrad), where Caulaincourt tried to maintain the alliance of Tilsit, and succeeded in maintaining the peace for some years. He accompanied Napoleon during the invasion of Russia, from which he had in vain sought to dissuade him. During the last years of the empire, Caulaincourt was charged with all the diplomatic negotiations. He signed the armistice of Pleswitz, June, 1813, represented France at the congress of Prague, in August, 1813, at the congress of Chatillon in Feb., 1814, and concluded the treaty of Fontainebleau on April 10, 1814. When Napoleon returned from Elba, he became minister of foreign affairs. After the second Restoration, Caulaincourt's name was on the proscription list, but it was erased on the personal intervention of Alexander I. with Louis XVIII.

Caulaincourt's memoirs appeared under the title of *Souvenirs du duc de Vicence* in 1837-40.

See A. Vandal, *Napoléon et Alexandre* (1891-95); Tatischeff, *Alexandre Ier et Napoléon* (1892); H. Houssaye, 1814 (1888) and 1815 (1893); N. Mikhailovich, *Les Relations diplomatiques de la Russie et de la France*, . . . 1805-1812 (1905).

CAULICULUS, in architecture, a form like a stalk, crowned with leaves, out of which grow scrolls, leaves or other stalks; especially in the Corinthian capital, and in the branching scroll or *rinseau*.

CAULIFLOWER: see CABBAGE.

CAULONIA, a town of the district of the Bruttii, Italy, on the east coast, on the promontory Capo Stilo, near Monasterace (Gr. *Καυλωνία*). It was the southernmost Achaean colony founded as an outpost of Croton or direct from Greece itself. In the 7th century it was allied with Croton and Sybaris, and coins, going back to 550 B.C., prove its importance. It took the side of Athens in the Peloponnesian War. In 389 B.C. it was destroyed by Dionysius, but soon afterwards restored. It was captured during the invasion of Pyrrhus by Campanian troops. Strabo speaks of it as deserted in his time. Excavations have revealed remains of the fortifications, with towers of the 7th-6th century B.C. A small temple must have stood near the lighthouse, and to it belonged architectural terra-cottas, and votive objects in the same material, especially small altars. The houses that have been found belong to a later period. Near the shore scanty remains of a large Doric temple (first half of 5th century B.C.) were found: also a trench full of architectural terra-cottas of this period. The tombs date from the 7th-3rd century B.C. but are poor.

See P. Orsi in *Monumenti dei Lincei*, xxiii. (1914) 685 seq.; xxix. (1924) 409 seq.

CAUSALITY or **CAUSATION** signifies the relation of cause and effect. Common sense assumes that things and events are the products or results of certain other things or events—the result is called the effect, and that which produces it is called the cause. The attempt to understand things usually takes the form of trying to discover their causes and effects. The belief in causes and effects is most probably derived partly from the human experience of exercising various activities in order to produce certain results or to achieve certain ends, and partly from the experience of suffering the effects of the actions of others. In the early stages of human thought natural phenomena were (and in the case of the young or the undeveloped still are) conceived after the analogy of such human experiences of doing things and of being acted on, of causing effects or suffering them. The mythological accounts of natural phenomena abundantly illustrate the anthropomorphic tendencies in the early attempts to explain or to understand reality. With the growth of rational knowledge the anthropomorphic elements in the interpretation of natural phenomena have gradually been eliminated, and a certain amount of suspicion has fallen upon the concept of causality. Some scientists, indeed, have gone so far as to reject it altogether from the realm of science. How this has come about will be explained presently. But it may be stated at once that this extreme attitude seems to be unwarranted, even if we admit the importance of checking one's conception of the causal relationship so as to purge it of anthropomorphic suggestions when applied to inanimate natural phenomena. Except among believers in magic, at the one extreme, and among thorough-going sceptics, at the other extreme, it is usually assumed,

either explicitly or at least implicitly, that every event has a cause, and that the same kind of cause has the same kind of effect. This assumption is commonly known as *the Postulate or Principle of Universal Causation*.

The Rationale of the Concept of Causality.—Let the attempt be made to dispense with the idea of causal connection. The resulting view of the world would be one of a mere sequence of disconnected phenomena. Now, some people are quite content to regard the world in that way—to view the ever-changing phenomena of nature as a mere sequence of new happenings in which each successive stage is in no sense the outcome of the preceding stage, but a new creation so to say. In a sense this was a favourite thought of certain scholastics, and even Descartes shared this view. Most people, however, find such a world of disconnected changes, or rather displacements, theoretically unintelligible and practically bewildering. Even the supporters of the aforementioned view of incessant new creations could not entirely abandon the conception of causality. For they regarded God as the Creator (or Cause) of each successive creation in the sequence of mutually disconnected events. But the thought of such supernatural interference at every moment in the flow of events is not likely to appeal to many men of science. Even on religious grounds some people would object to the conception of a world, or rather of innumerable worlds, so ill-constructed by the Maker as to have to be scrapped and replaced every moment. It seems to be more satisfying to human intelligence, and more in accordance with human experience, to suppose an orderly continuity in each sequence of changes. And the causal concept gives expression to this implicit faith in the connected continuity of events. The scientific conception of the conservation of matter or energy is prompted very largely by the same kind of consideration, namely, the belief that there are no phenomena arising suddenly out of nothing as it were, but that in some sense each event is the outcome of preceding events, that each event is in fact only a new manifestation of the matter or energy of some preceding event or events. The rationale or logical motive of the concept of causality is, in short, to be found in the effort to see orderly continuity in the world of reality. And the sense of, or feeling for, continuity may itself be derived psychologically from man's consciousness of his own continuity under normal conditions.

The Inferential Character of Causal Connections.—The causal relation between events is not something that can be perceived by means of the senses. What we perceive is *sequence* of events; and it is from their sequence that we feel justified in inferring their causal connection, provided certain conditions are satisfied (for these conditions see the article SCIENTIFIC METHODS). The inferential character of our beliefs in causal connections exposes them to adverse criticisms of an easy kind. It may be argued, indeed it has been argued, that the inference to causal connection may be wrong, or that at best it is highly speculative, so why not confine ourselves to the description of the bare sequence and ignore the question of causation? Such, for instance, was the view of Hume (*q.v.*), who contended that the alleged causal necessity in the sequence of the so-called causes and effects is just the hypostasis or projection of our habit of expecting certain consequents to follow certain antecedents merely because we had observed those sequences on previous occasions. It was largely in consequence of Hume's criticism that Kant concluded that causality is a category, that is, one of the ultimate *a priori* forms in which the understanding spontaneously orders its experiences (see CATEGORY)—something that is not derived from experience, but on the contrary is required to make orderly experience itself possible. It is noteworthy that Hume's attempt to explain away causality made use of this very category. For if there were no causal connection between the repeated observation of a certain sequence and the formation of a corresponding habit of expectation, Hume's adverse criticism of causality would have no basis in fact. Moreover, if Hume were taken literally we should have no ground for supposing any connection between his thoughts and his utterances, and so could not surmise what he really thought about causality or anything else. Common sense revolts against the attempt to reduce causality to bare sequence. The attempts offend

the active nature of man. Moreover, not every sequence is a causal sequence. Many beliefs that common sense condemns as superstitious are beliefs that result from an inability to distinguish between mere sequence and connection, so that if one event follows another (say, illness or death after being one of a party of thirteen) it is regarded as its effect. At the stage of logical reflection this slovenly way of thinking is condemned as the fallacy *post hoc, ergo propter hoc* (after this, therefore because of it).

Cause and Law.—Prompted partly by Hume's criticism, partly by Kant's apparently subjective interpretation of causality, and partly by the anthropomorphic origin of the conception of causation, some modern thinkers (Helmholtz, Mach, Pearson and others) have urged that science should discard it in favour of the concept of law. This movement is intimately connected with the tendency to make science purely descriptive without any pretence to be explanatory. The causal concept, it is urged, is an explanatory concept with a tincture of fetishism about it, why not confine the business of science to the discovery of descriptive laws expressing uniform sequences, without pretending to explain these by reference to alleged causes? This trend of thought fits in very well with the main tendency of the more exact sciences in modern times. Under the influence of Copernicus, Galilei, Descartes and Newton the aim of the physical sciences has come to be regarded as that of discovering descriptive equations expressing quantitative correlations of phenomena. Correlated phenomena are treated like mathematical functions. Causal connections tend to be ignored, in fact everything tends to be ignored that cannot be expressed in equations. This movement is really a legacy from ancient Pythagoreanism, which identified the essence of things with numbers. That philosophy has indeed been abandoned long since, but its consequences have been retained. And this notwithstanding the growing realization that mathematical equations, after all, tell us extremely little about the real nature of things, apart from their comparatively external quantitative correlations. So marked is this tendency to let equations supplant causal connections that it has actually been urged that there is no good reason for the customary restriction of the term cause to antecedents only, and of the term effect to consequents only, seeing that antecedents and consequents are mutually inferable. This is to save the name and kill the meaning of cause—causality is not the same as law or uniformity. It may be found in unique events (such as the biographer and the historian are mostly concerned with) that are not formulated in laws at all. On the other hand, there are laws, even laws of sequence, that are either not causal at all (say, the sequence of a mathematical progression) or at least are not directly causal (say, the sequence of day and night, or of the seasons). Even when expressible in laws or uniformities of sequence, the causal connection is something more than the bare uniformity of sequence. No doubt it is objectionable to introduce anthropomorphism or animism into the study of inanimate phenomena. No doubt it is well to remember the obstruction to science caused by "substantial forms," etc. But caution may be carried too far. After all, even human beings are natural phenomena, and their experiences may be used as a clue to the interpretation of nature, provided due care is exercised. It would certainly be extravagant to project into the causal sequences of inanimate phenomena anything analogous to the sense of effort or of constraint that is experienced in human activity or passivity respectively. But that is no reason for discarding causality altogether. Carried through consistently, this can only end in the conception of the world as a series of independent miracles—a view even more irrational than the anthropomorphism which it is intended to correct. The principle of conservation of matter or energy would lose all significance without the idea of causal continuity, according to which certain successive events not only *follow*, but *follow from* one another. In fact, mere laws of sequence are only intelligible in the last resort, when they can be shown to result from direct or indirect causal connections.

Cause and Condition.—To explain adequately the term cause, it is necessary to show its relation to the term condition. A condition is anything that is necessary to a certain result—anything in the absence of which that result would not be achieved. A thing

may, however, be indispensable to a certain result and yet be insufficient to produce it. For instance, a damp atmosphere is necessary for fine cotton-spinning; but other things are required besides—cotton, machines, workers, etc. Now the cause of a certain effect is that totality of conditions that is sufficient to produce it. As a rule a cause is complex—it consists of a number of conditions each of which is only a part of the cause. Popularly some one condition is selected and called the cause. This is frequently legitimate, inasmuch as the presence of the other conditions is obviously assumed, and it would be pedantry to name them all. But at other times it is due to oversight—many rival remedies for social ills are each but a condition rather than a likely cause of the effect aimed at. Another fact to be noted is that the expected result does not always follow when all the necessary conditions appear to be operative. This happens when there are counteracting forces at work that thwart the expected result. For example, the sunshine that would normally flood a room with light and warmth may be excluded by closed shutters. To secure a certain effect it is therefore necessary to secure the absence of counteracting conditions as well as the presence of all the *positive* or contributory conditions. The absence of all hindrances to an effect is usually described as its *negative* condition. So that the complete cause will consist of negative as well as positive conditions. Negative conditions may play a very important rôle, as when armies or taxpayers suffer through insufficient vigilance.

A word may be added about *Plurality of Causes*, or the view that the same kind of effect may in different instances be produced by different kinds of causes. In a general way different causes may produce results that may serve the same practical purpose—light, warmth, satisfaction, death, etc., may be produced in a large variety of ways, and yet make no serious practical difference. Strictly speaking, however, the effect is always different in some way when the cause is different in any way. Although death, *e.g.*, may result from any of the thousand ills that flesh is heir to, and it may make little or no practical difference which of them actually caused it, yet when the occasion requires it coroners' inquests are held in the just belief that differences in the cause of death can be inferred from differences in the state of the dead body. So that, strictly speaking, not only does the same cause always produce the same effect, but the same effect can only be produced by one kind of cause.

Historical.—The category of causality must have been used implicitly from the very dawn of human intelligence. But the implicit use of a category is one thing, its explicit formulation is another thing. The oldest formulation on record is that of Leucippus (5th century B.C.), who formulated the principle that "nothing happens without a cause, everything has a cause and is necessary." Plato distinguished various kinds of causes. But the distinctions best known and most widely accepted during many centuries are those made by Aristotle, who recognized *material*, *formal*, *efficient* and *final causes*. He maintained that in order to understand some things completely we must know (1) the *material* of which they are made, (2) the *form* or law of their structure, (3) the active agent or *agency* that effected the imposition of the form upon the matter, and (4) the *final purpose* or end that the effect is adapted to serve. These four types of causes were elaborated during the middle ages, and the text-books on Logic that were in vogue in the 17th century (*e.g.*, Burgersdijck's or Heereboord's *Logic*) distinguish some 40 kinds of causes (a summary of these will be found in A. Wolf, *Spinoza's Short Treatise*, pp. 190–195). These distinctions were not as extravagant as may be supposed. Interpreted as kinds of *conditions*, rather than causes, many of them are still worthy of consideration, and some of them are actually still in use in law and medicine. The less known distinctions that are of importance in the history of philosophy are those of *immanent* and *occasional causes*. An immanent cause is one the effects of which remain within it, as distinguished from a *transitive cause*, which operates on things outside itself. For instance, God, according to Spinoza, is an immanent cause, for, according to pantheistic philosophy, there is nothing outside God; on the other hand, the popular conception of God is mostly

that of a transitive Cause, creating and maintaining a world outside Himself. An *occasional cause* is simply the occasion of an occurrence, whereas an efficient cause is what produces it. According to Occasionalism (*q.v.*), bodily changes do not produce mental ones, or vice versa, but a change of either kind is the occasion for the occurrence of a change of the other kind, through the intervention of God as efficient cause.

CAUSE AND EFFECT: see CAUSALITY.

CAUSEWAY. A path on a raised dam or mound across marshes or low-lying ground; the word is also used of old paved highways, such as the Roman military roads. "Causey" is still used dialectically in England for a paved or cobbled footpath. The word is properly "causey-way," from *causey*, a mound or dam which is derived, through the Norman-French *caucie* (*cf.* modern *chaussée*), from the late Latin *via calciata*, a road stamped firm with the feet (*calcare*, to tread).

CAUSSES, a natural region in the south of the central plateau of France, chiefly in the departments of Lozère and Aveyron, west of the curving Cevennes and south of the Lot valley. This vast plateau of Jurassic limestone, sloping westwards, is divided into several sections by deep-cut river channels. These smaller plateaux, barren and deserted, are called the *Causse* from *cau*, the local form of the French *chaux*, *i.e.*, lime. The most typical is the Causse Méjean, south of the Tarn between Florac and Millau, a sterile sparsely-peopled table-land lying between 3,000 and 4,000 ft. above sea-level. To the north lies the Causse de Sauveterre prolonged westwards by the Causse de Sévérac. Those of Quercy, Gramat and Rouergue are lower and less arid. Drainage features such as underground streams, fissures and pot-holes (*avens*) are characteristic. The inhabitants (*Causse*ards) cultivate rye and potatoes where possible, but subsist for the most part on the sheep from whose milk Roquefort cheese is made. Similar dry limestone areas elsewhere are designated under the cognate German *Karst* or Italian *Carso* (*q.v.*).

CAUSSIN DE PERCEVAL, ARMAND-PIERRE (1795–1871), French Orientalist, was born in Paris, where he died during the siege.

His father, Jean Jacques (1759–1835), was professor of Arabic at the Collège de France, and his son, after extended travels in Asia Minor, succeeded to his chair.

His works include a useful *Grammaire arabe vulgaire* (4th ed., 1858), and an enlarged edition of Élie Bocthor's *Dictionnaire français-arabe* (3rd ed., 1864); but his great reputation rests on his *Essai sur l'histoire des Arabes avant l'Islamisme, pendant l'époque de Mahomet* (3 vols., 1847–49), in which the native traditions as to the early history of the Arabs, down to the death of Mohammed and the complete subjection of all the tribes to Islam, are set forth with much learning and lucidity.

CAUSTIC. That which burns (Gr. *καυστικός*, burning). In *surgery*, the term given to substances which destroy living tissues and so inhibit the action of organic poisons, as in bites, malignant disease and gangrenous processes. Such caustic substances include silver nitrate (Lunar caustic), Potassium and Sodium Hydrates (the Caustic Alkalis) (see ALKALI), Zinc chloride, an acid solution of mercuric nitrate, and pure carbolic acid (Phenol).

In *mathematics*, the "Caustic Surfaces" of a given surface are the envelopes of the normals to the surface, or the loci of its centres of curvature.

In *optics* (geometrical optics) the term "Caustic" is applied to the envelope of luminous rays after reflection or refraction. In the first case the envelope is termed a cata-caustic, in the second a dia-caustic. Cata-caustics are to be observed as bright curves when light is allowed to fall on a polished cylindrical surface as a napkin ring or a curved polished riband of steel placed on a table. By varying the curvature of the riband of steel or moving the source of light a variety of patterns can be obtained. The investigation of caustics, based as it is on the assumption of the law of the rectilinear propagation of light and the validity

of the experimental laws of reflection and refraction, is essentially of a geometrical nature, and as such attracted the attention of mathematicians of the 17th and succeeding centuries, more notably John Bernoulli, G. F. de l'Hopital, E. W. Tschionhausen and Louis Carre.

See Arthur Cayley's *Memoirs on Caustics* in Phil. Trans. for 1857 and 1867.

CAUSTIC SODA (Sodium hydroxide, NaOH) is a solid, white, deliquescent chemical compound much used as an intermediate material in the production of many chemicals. It is generally made by one of two methods, either through exchange of base by the causticizing of soda-ash (Na_2CO_3) with hydrated lime or directly, through the action of an electric current upon a solution of common salt (NaCl). The latter newer process is tending to supersede the former, especially where cheap electric power is available or where a ready market for chlorine and hydrogen, by-products of the electrolytic process, exists. Because of its large production, caustic soda is classed as a "heavy chemical." It is used as an alkaline reagent, in the manufacture of soap, sodium salts, rayon, paper, medicines, textile products, in petroleum and vegetable oil refining, in tanning and in the synthesis of many organic compounds such as indigo, alizarin, resorcin, formates and oxalates.

CAUTERETS, a watering-place of south-western France in the department of Hautes-Pyrénées, 20m. S. by W. of Lourdes by rail. Pop. (1926) 1,032. It lies in the beautiful valley of the Gave de Cauterets, and is well known for its thermal springs, and as a station for winter sports. Some 50,000 visitors are attracted annually. The 22 springs produce copious supplies of sulphuretted water and serve nine *établissements*. Their temperature varies between 75° and 137°. Cauterets is a centre for excursions, the Monné (8,937ft.), the Cabaliros (7,155ft.), the Pic de Chabarrou (9,550ft.), the Vignemale (10,820ft.), and other summits being in its neighbourhood. The properties of the waters have been known at least since the 10th century: they became famous in the 16th century when Marguerite de Valois composed the "Heptameron," on the model of Boccaccio's "Decameron," while visiting the spa with her court.

CAUTIN, a province of southern Chile, bounded N. by Concepción and Bio-Bio, E. by Argentina, S. by Valdivia, and W. by the Pacific. Its area, before the addition of considerable territory in 1928, was estimated at 5,832 sq. miles. Cautin lies within the temperate agricultural and forest region of the south, and produces wheat, cattle, lumber, tan-bark and fruit. The State central railway from Santiago to Puerto Montt crosses the province from north to south, and the Cautin, or Imperial, and Tolten rivers cross from east to west, both affording excellent transportation facilities. The province once formed part of the territory occupied by the Araucanian Indians, and its present political existence dates from 1887. Its population (1920) was 193,628, including many European immigrants, principally Germans. The capital is Temuco, on the Rio Cautin; pop. (1920) 28,546. The principal towns besides Temuco are Lautaro (3,139) and Nueva Imperial, pop. (1920) 4,781. Both are of historic interest because they were fortified Spanish outposts in the long struggle with the Araucanians.

CAUTLEY, SIR PROBY THOMAS (1802-1871), English engineer and palaeontologist, was born in Suffolk in 1802. After some years' service in the Bengal artillery, which he joined in 1819, he was engaged on the reconstruction of the Doab canal. He had charge of the completed canal for 12 years (1831-43). In 1840 he reported on the proposed Ganges canal, for the irrigation of the country between the rivers Ganges, Hindan, and Jumna. This project was sanctioned in 1841, but the work was not begun till 1843, and even then Cautley found himself hampered in its execution by the opposition of Lord Ellenborough. For want of competent help he had to do the drudgery of surveying and levelling himself, for some time. From 1845 to 1848 he was absent in England owing to ill-health, and on his return to India he was appointed director of canals in the North-western Provinces. After the Ganges canal was opened in 1854 he spent some time in England, and from 1858 to 1868 he occupied a seat

on the council of India. He died at Sydenham, near London, on Jan. 25, 1871. Cautley was a distinguished palaeontologist and contributed numerous memoirs, some written in collaboration with Dr. Hugh Falconer, to the *Proceedings* of the Bengal Asiatic Society and the Geological Society of London on the geology and fossil remains of the Sivalik hills.

CAUVERY, a river of southern India. Rising in Coorg, high up amid the Western Ghats, in 12° 25' N. lat. and 75° 34' E. long., it flows generally south-east across the plateau of Mysore, and finally enters the bay of Bengal through two principal mouths in Tanjore district. Its length is 472 m. Its course in Coorg is tortuous, and its bed generally rocky with high banks covered with luxuriant vegetation. On entering Mysore it passes through a narrow gorge, but presently widens to a breadth of 300 to 400 yd. The bed is too rocky for navigation. In its course through Mysore the channel is interrupted by a number of anicuts or dams for irrigation. In Mysore state the Cauvery forms the two islands of Seringapatam and Sivasamudram, which vie in sanctity with the island of Seringam lower down in Trichinopoly district. Around the island of Sivasamudram are the celebrated falls of the Cauvery, where the river branches into two channels, each of which makes a descent of about 320 ft. After entering the Madras presidency, the Cauvery forms the boundary between the Coimbatore and Salem districts, until it reaches Trichinopoly district. Sweeping past the historic rock of Trichinopoly, it breaks at the island of Seringam into two channels, which enclose between them the delta of Tanjore, the garden of southern India. The northern channel is called the Coleroon (Kolidam). On the seaward face of its delta are the open roadsteads of Negapatam and French Karikal. The only navigation on any portion of its course is carried on in boats of basket-work. There is an extensive irrigation system in the delta. The most ancient work is a massive dam of unhewn stone, across the stream of the Cauvery proper, which is supposed to date back to the 4th century, but is still in excellent repair. The chief modern work is the anicut across the Coleroon, 2,250 ft. long, which irrigates an area of some 600,000 acres. Altogether a total of about a million acres are irrigated from the Cauvery, and the Cauvery falls have been utilized for an electric power plant, which supplies power to the Kolar goldmines and light and power to Bangalore and Mysore.

The Cauvery is known to devout Hindus as Dakshini Ganga, or the Ganges of the south, and the whole of its course is holy ground. The Cauvery reservoir project, which will largely improve and extend the irrigation facilities, was sanctioned in 1925. It will include a dam at Metur and a canal 88 m. long.

CAVA DEI TIRRENI, a town and episcopal see of Campania, Italy, in the province of Salerno, 6 m. N.W. by rail from the town of Salerno. Pop. (1921), town, 8,691; commune, 26,729. It lies fairly high in a richly cultivated valley, surrounded by wooded hills, and is a favourite resort. A mile to the south-west is the village of Corpo di Cava (1,970 ft.), with the Benedictine abbey of La Trinità della Cava, founded in 1025 by St. Alferius. The church and the greater part of the buildings were entirely modernized in 1796. The old Gothic cloisters are preserved. The archives, now national property, include documents and MSS. of great value.

M. Morcaldi, *Codex Diplomaticus Cavensis* (1873-1893) has published many important documents relating to the abbey.

CAVAEDIUM, in architecture, a synonym for atrium (*q.v.*), the central hall or court of a Roman house. Vitruvius lists five types: 1. The Tuscanicum. This, the most common type, was without columns, the hole in the roof being supported by the framing of the roof timbers. 2. The Tetrastylon, in which four columns supported the roof at the corners of its opening. 3. The Corinthian, in which more than four columns are employed, so that the cavaedium becomes, in essence, a peristyle (*q.v.*). 4. The Displuviatum, where the roof sloped down, away from the opening, instead of towards it. 5. The Testudinatum, in which the entire area was covered by a continuous roof.

CAVAGNARI, SIR PIERRE LOUIS NAPOLEON (1841-1879), British military administrator, the son of a French general by his marriage with an Irish lady, was born at Stenay,

Meuse, on July 4, 1841. He obtained naturalization as an Englishman, and entered the military service of the East India Company. He served through the Oudh campaign against the mutineers in 1858 and 1859. In 1861 he was appointed an assistant commissioner in the Punjab, and in 1877 became deputy commissioner of Peshawar and took part in several expeditions against the hill tribes. In 1878 he was attached to the staff of the British mission to Kabul, which the Afghans refused to allow to proceed. In May 1879, after the death of the amir Shere Ali, Cavagnari negotiated and signed the treaty of Gandamak with his successor, Yakub Khan. By this the Afghans agreed to admit a British resident at Kabul, and Cavagnari was appointed. He took up his residence in July, and for a time all seemed to go well, but on Sept. 3 Cavagnari and the other European members of the mission were massacred in a sudden rising of mutinous Afghan troops. (See AFGHANISTAN.)

CAVAIGNAC, LOUIS EUGÈNE (1802-1857), French general, born in Paris on Oct. 15, 1802, belonged to a family famous in French revolutionary annals. He was the son of JEAN-BAPTISTE CAVAIGNAC (1762-1829), who was a member of the Convention, and acted as its commissioner in the repression of the opponents of the Revolution in various parts of France. At the Restoration he was proscribed as a regicide. Jean-Baptiste's brother, JACQUES MARIE, VICOMTE CAVAIGNAC (1773-1855), was one of Napoleon's generals and commanded the cavalry of the 11th Corps in the retreat from Moscow (1812). GODEFROY CAVAIGNAC (1801-1845), elder brother of Louis Eugène, took part in the Parisian risings of Oct. 1830, 1832 and 1834, and was one of the founders of the Société des Droits de l'Homme. Very highly esteemed for his chivalrous character among the republicans, he was probably personally both the most estimable and able of the old guard of republicans. His reputation was largely, if not wholly, responsible later for the advancement of Louis Eugène, who entered the army.

In 1831 Louis Eugène was removed from active duty in consequence of his declared republicanism, but in 1832 he was recalled to the service and sent to Algeria, where he held a series of commands during the next 16 years. In 1848, the revolutionary Government promoted him governor-general. He refused the post of minister of war because the Government would not fall in with his plan to occupy Paris by troops. Like L. A. Thiers, Cavaignac conceived the idea of drawing the "red republicans" of Paris out into open insurrection, in order that they might be crushed and the domination of the moderates secured. After the National Assembly had eliminated the Socialist members Louis Blanc and Albert (qq.v.) from the Government, Cavaignac was made minister of war. The revolt on which he had calculated broke out on June 22, 1848 (see NATIONAL WORKSHOPS). Cavaignac withdrew his troops from the affected parts of Paris, till, in his opinion, the revolt had gained sufficient head. He took advantage of the general panic, further, to insist on the resignation of the Government and the granting of dictatorial powers to himself, which was agreed on June 25. His attack on the Parisian rebels, who were exclusively working class, led to the bloodiest and most obstinate conflict that had up till then occurred in Paris; at its end, in his victory on the 26th, Cavaignac permitted, in accordance with his plan, the severest reprisals which decimated the ranks of the Socialists and broke their power.

Both he and his adversaries expected that after laying down his dictatorship he would be elected president. But they had not allowed for the magic of the name of "Louis Napoleon Bonaparte"; a "landslide" of peasant and proletarian votes gave 5,434,226 to the future Napoleon III. and only 1,448,107 to Cavaignac. The disappointed general went into opposition and at the time of the *coup d'état* (Dec. 2, 1851) was even imprisoned for a short while. After his release he abandoned politics and died in retirement on Oct. 28, 1857.

See Louis Menard, *Prologue d'une Révolution* (reprinted 1904); Ch. Schmidt, *Les Journées de juin 1848* (1926); P. de la Gorce, *Histoire de la 2de République* (1914); G. Renard, *La République de 1848* (1900-8); R. W. Postgate, *Revolution from 1789 to 1906* (1920, full bibliog.).

His son, JACQUES MARIE EUGÈNE GODEFROI CAVAIGNAC (1853-1905), French politician, was born in Paris on May 21, 1853. He served as a civil engineer in Angoulême until 1881, when he became master of requests in the Council of State. In 1882 he was elected deputy for Saint-Calais (Sarthe) in the republican interest. In 1885-86 he was under-secretary for war in the Henri Brisson Ministry, and he served in the cabinet of Émile Loubet (1892) as minister of marine and of the colonies. He had exchanged his moderate republicanism for radical views before he became war minister in the cabinet of Léon Bourgeois (1895-96). He was again minister of war in the Brisson cabinet in July 1898, when he read in the chamber a document which definitely incriminated Capt. Alfred Dreyfus. On Aug. 30, however, he stated that this had been discovered to be a forgery by Col. Henry, but he refused to concur with his colleagues in a revision of the Dreyfus prosecution, which was the logical outcome of his own exposure of the forgery. Resigning his portfolio, he joined the Nationalist group in the chamber, and became an energetic supporter of the Ligue de la Patrie Française. In 1899 Cavaignac was an unsuccessful candidate for the presidency of the republic. He died at his country-seat near Flée (Sarthe) on Sept. 25, 1905. He wrote an important book on the *Formation de la Prusse contemporaine* (1891-98), dealing with the events of 1806-13.

See J. M. Cavaignac, *Les deux généraux Cavaignac* (1897); A. Deschamps, *Les deux généraux Cavaignac* (1898); W. Arnoulim, *L'Action clericale en France, Les Cavaignacs devant l'histoire* (1905).

CAVAILLON, a town of south-eastern France in the department of Vaucluse, 20m. S.E. of Avignon. Pop. (1926), 6,955. It lies at the southern foot of Mount St. Jacques on the right bank of the Durance above its confluence with the Coulon. To the south of the present town lay the Roman *Cabellio*, a place of some note in territory of the Cavares. Since mediaeval times the town has for the most part followed the fortunes of the Comtat Venaissin, in which it was included. Till the Revolution it was the see of a bishop, and had a large number of monastic establishments. The church of St. Vêran is a fine example of 12th century Provençal architecture, with a charming cloister adjoining. The town is the centre of a rich and well-irrigated plain, which produces fruits and early vegetables. Silk-worms are reared, and silk is an important article of trade. The preparation of preserved vegetables and fruits, distilling, and the manufacture of straw hats and leather are carried on.

CAVALCANTI, GUIDO (c. 1250-1300), Italian poet and philosopher, was the son of a philosopher whom Dante, in the *Inferno*, condemns to torment among the epicureans and atheists; but he himself was a friend of the poet. By marriage with Beatrice, daughter of Farinata Uberti, he became head of the Ghibellines. He was banished to Sarzana, where he caught a fever, of which he died. Cavalcanti has left a number of love sonnets and canzoni, in honor of a French lady, whom he calls Mandetta. His complete poetical works are contained in Giunti's collection (Florence, 1527; Venice, 1531-32).

The most famous of his sonnets and canzoni are translated by D. G. Rossetti in his *Dante and his Circle* (1874).

CAVALCASELLE, GIOVANNI BATTISTA (1820-1897), Italian writer on art, was born at Legnago on Jan. 22, 1820. He became a student at the Academia delle Belle Arti in Venice, and from early youth studied the art treasures of Italy. His relations sent him to Padua, hoping that he might become an engineer, but in 1844 he returned to his artistic studies. He visited the cities of Tuscany, and then set out to see the masterpieces of Italian art in foreign countries. During a stay in Germany in 1846 and 1847 he made the acquaintance of Joseph Archer Crowe in a post carriage between Hamm and Minden. The two young men felt drawn to each other and met again in Berlin, where they studied together some pictures in the museum. On his return to Venice Cavalcaselle took an active part in the revolution of 1848 against the Austrian rule. He was arrested by Austrian gendarmes and narrowly escaped being shot. He then joined the forces of Garibaldi and was taken prisoner by the French in 1849. He arrived in a miserable plight in Paris, where by good fortune he again met Crowe, and with his help came to

London. The two friends occupied rooms together and worked on a history of early Flemish painters, published in 1857. In the same year Cavalcaselle returned to Italy. In 1864 Crowe and Cavalcaselle published their great work, *New History of Italian Painting*, which was followed by the *History of Painting in North Italy*. Other joint works were *Titian* (1876) and *Raphael* (1883). Cavalcaselle's independent writings are of less importance: *Sul più autentico ritratto di Dante* (1865); *Sulla conservazione dei Monumenti ed oggetti di belle arti*; *Sulle riforme dell' insegnamento academico* (1875).

Cavalcaselle was for some time secretary to the great art critic and collector, Giovanni Morelli, and his travelling companion when Morelli compiled the inventory of the works of art in the Marca d'Ancona for the Italian Government. Towards the end of his life Cavalcaselle held office as ispettore di belle arti in the Ministry of Education in Rome. He died on Oct. 31, 1897.

Crowe and Cavalcaselle's histories of Italian art are standard works, and have recently been re-edited by Langton Douglas and Tancred Borenius.

CAVALIER, JEAN (1681-1740), the famous chief of the Camisards (*q.v.*), was born at Mas Roux, near Anduze (Gard), on Nov. 28, 1681. His father, an illiterate peasant, had been compelled by persecution to become a Roman Catholic along with his family, but his mother brought him up secretly in the Protestant faith. Threatened with prosecution for his religious opinions he went to Geneva, where he passed the year 1701; he returned to the Cévennes on the eve of the rebellion of the Camisards, who by the murder of the Abbé du Chayla at Pont-de-Monvert on the night of July 24, 1702, raised the standard of revolt. Some months later he became their leader. He showed an extraordinary genius for war. Within a period of two years he was to hold in check Count Maurice de Broglie and Marshal Montrevel, and to carry on one of the most terrible partisan wars in French history.

He maintained the most severe discipline. Each battle increased the terror of his name. On Christmas day, 1702, he dared to hold a religious assembly at the very gates of Alais, and put to flight the local militia which came forth to attack him. At Vagnas, on Feb. 10, 1703, he routed the royal troops, but, defeated in his turn, he was compelled to find safety in flight. But he reappeared, was again defeated at Tour de Bellot (April 30), and again recovered himself, recruits flocking to him to fill up the places of the slain. Cavalier boldly carried the war into the plain, made terrible reprisals, and threatened even Nîmes itself. On April 16, 1704, he encountered Marshal Montrevel himself at the bridge of Nages, with 1,000 men against 5,000, and, though defeated after a desperate conflict, he made a successful retreat. Cavalier was induced to attend a conference at Pont d'Avène near Alais on May 11, 1704, and on May 16, he made submission at Nîmes. Louis XIV. gave him a commission as colonel, which Villars presented to him personally, and a pension of 1,200 livres. At the same time the king authorized the formation of a Camisard regiment for service in Spain under his command.

Before leaving the Cévennes for the last time he went to Alais and to Ribaute, followed by an immense concourse of people. But Cavalier had not been able to obtain liberty of conscience, and his Camisards almost to a man broke forth in wrath against him, reproaching him for what they described as his treacherous desertion. On June 21, 1704, with a hundred Camisards who were still faithful to him, he departed from Nîmes and came to Neu-Brisach (Alsace), where he was to be quartered. From Dijon he went on to Paris, where Louis XIV. gave him audience and heard his explanation of the revolt of the Cévennes. Returning to Dijon, fearing to be imprisoned in the fortress of Neu-Brisach, he escaped with his troop near Montbéliard and took refuge at Lausanne. But he was too much of a soldier to abandon the career of arms. He offered his services to the duke of Savoy, and with his Camisards made war in the Val d'Aosta. After the peace he crossed to England, where he formed a regiment of refugees which took part in the Spanish expedition under the earl of Peterborough and Sir Cloudesley Shovel in May, 1705.

At the battle of Almansa the Camisards found themselves opposed to a French regiment, and without firing the two bodies rushed one upon the other. "I fought," Cavalier wrote on July 10, "as long as a man stood beside me and until numbers overpowered me, losing also an immense quantity of blood from a dozen wounds which I received." Marshal Berwick never spoke of this tragic event without visible emotion.

On his return to England a small pension was given him. He settled at Dublin, where he published *Memoirs of the Wars of the Cévennes under Col. Cavalier*, written in French and translated into English with a dedication to Lord Carteret (1726). He was made general on Oct. 27, 1735, and on May 25, 1738, was appointed lieutenant-governor of Jersey. He was promoted major-general in July, 1739, and died in the following year.

See N. A. F. Puaux, *Vie de Jean Cavalier* (1868); David C. A. Agnew, *Protestant Exiles from France*, ii. 54-66 (1871); Charvey, *Jean Cavalier: nouveaux documents inédits* (1884). Eugène Sue popularized the name of the Camisard chief in *Jean Cavalier ou les fanatiques des Cévennes* (1840). A new edition of Cavalier's *Mémoires sur la guerre des Cévennes* was published by F. Puaux in 1918.

CAVALIER, a horseman, particularly a horse-soldier or one of gentle birth, trained in knightly exercises. The word is taken through the French from the Late Lat. *caballarius*, a horseman. *Chevalier*, the French word of parallel descent, means "knight," and is chiefly used in English for a member of certain foreign military or other orders, particularly of the Legion of Honour. Cavalier in English was early applied in a contemptuous sense to an overbearing swashbuckler. Originally used as a term of reproach, it was soon adopted as a title of honour by the supporters of Charles I. in the Great Rebellion, who applied Roundhead to their opponents, and at the Restoration the court party preserved the name, which survived till the rise of the term Tory (see **WHIG AND TORY**). The term "cavalier," in fortification, means a work of great command constructed in the interior of a fort, bastion or other defence, so as to fire over the main parapet without interfering with its firing. A greater volume of fire can thus be obtained, but the great height of the cavalier makes it an easy target for a besieger's guns.

CAVALIERI, BONAVENTURA (1598-1647), Italian mathematician, was born at Milan; his name also occurs in the forms Cavallieri, Cavaglieri, Cavalierius, and de Cavalieris. He became a Jesuit at an early age and later was inspired to study mathematics by reading a copy of Euclid. On the recommendation of his Order he was made a professor at Bologna in 1629; the post, which he held until he died, was renewed periodically. In 1635 Cavalieri wrote *Geometria indivisibilibus continuorum nova quadam ratione promota*, in which he first stated his principle of indivisibles. The form of the principle was unsatisfactory and was attacked by Guldin. In reply to this attack Cavalieri wrote *Exercitationes geometricae sex* (1647), stating the principle in the more satisfactory form in which it was used by 17th century mathematicians. This work also contained the first rigid proof of Guldin's theorem relating to the volume of a solid of revolution. The theorem had occurred in the writings of Pappus and had been used in an unsatisfactory fashion by Kepler. Using the principle of indivisibles as a sort of integral calculus, Cavalieri solved a number of problems proposed by Kepler. Other books by Cavalieri are: *Lo specchio istorico ovvero trattato delle settioni coniche* (1632), *Directorium generale uranometricum, in quo trigonometriae logarithmicae fundamenta ac regula demonstrantur* (1632) and *Trigonometria plana et sphaerica* (1643). Cavalieri died at Bologna on Dec. 3, 1647.

The life of Cavalieri has been written by P. Frisi (Milan, 1776), and by F. Predari (Milan, 1843).

CAVALIERI, EMILIO DEL (1550?-1599?), Italian composer, was born in Rome about 1550 of a noble family and became one of the famous Florentine group of musical reformers—Peri, Rinuccini, Caccini and the rest—who had such an important influence on the subsequent developments of the art.

Cavalieri's style is more facile than that of Peri and Caccini, but he is inferior to them in depth of musical expression. He is, however, important as having been the first to apply the new monodic style to sacred music, and as the founder of the Roman

school of the 17th century which included Mazzocchi, Carissimi and Alessandro Scarlatti.

CAVALLI, FRANCESCO (1602–1676), an early Italian operatic composer of note, was born at Crema in 1602. His real name was Pietro Francesco Caletti-Bruni, but he is better known by that of Cavalli, the name of his patron, a Venetian nobleman. He became a singer at St. Mark's in Venice in 1617, second organist in 1639, first organist in 1665, and in 1668 *maestro di cappella*. He is, however, chiefly important for his operas, twenty-seven of which are still extant, most of them being preserved in the library of St. Mark's at Venice. Monteverde had found opera a musico-literary experiment, and left it a magnificent dramatic spectacle. Cavalli succeeded in making it a popular entertainment. He reduced Monteverde's extravagant orchestra to more practical limits, introduced melodious arias into his music and popular types into his *libretti*. His operas have all the characteristic exaggerations and absurdities of the 17th century, but they have also a remarkably strong sense of dramatic effect as well as a great musical facility, and a grotesque humour which was characteristic of Italian grand opera down to the death of Alessandro Scarlatti.

CAVALLINI, PIETRO (c. 1259–1344), Italian painter, born in Rome, was taught painting and mosaic by Giotto while employed at Rome; it is believed that he assisted his master in the mosaic of the Navicella or ship of St. Peter, in the porch of the church of that saint. He also studied under the Cosmati. Lanzi describes him as an adept in both arts, and mentions with approbation his grand fresco of a Crucifixion at Assisi, still in tolerable preservation; he was, moreover, versed in architecture and in sculpture. According to George Vertue, it is highly probable that Cavallini executed, in 1279, the mosaics and other ornaments of the tomb of Edward the Confessor in Westminster Abbey. He would thus be the "Petrus Civis Romanus" whose name is inscribed on the shrine; but a comparison of dates invalidates this surmise. He died in 1344 at the age of 85. Some important works by Cavallini in the church of Santa Cecilia in Trastevere, Rome, were discovered early in this century.

CAVALLOTTI, FELICE (1842–1898), Italian politician, poet and dramatic author, was born in Milan. In 1860 and 1866 he fought with the Garibaldian Corps, but he first attained notoriety by his anti-monarchical lampoons in the *Gazzetta di Milano* and the *Gazzetta Roas* between 1866 and 1872. Elected to parliament in 1872, his turbulent eloquence secured for him the leadership of the extreme Left in 1886 on Bertani's death. His advocacy of democratic reform made him the most popular man of his day next to Crispi, against whom he waged an unceasing and bitter campaign. He was killed in a duel with Count Macola.

See A. de Mohr, *Felice Cavallotti: La Vita e le opere* (Milan, 1899).

CAVALRY. Throughout the history of war, cavalry have been surrounded by a glamour possessed by no other arm, and though to-day their tactical value is small their prestige endures, and rightly; for without a mobile arm tactics as an art must cease to be. In the World War of 1914–18 the limitations which the bullet placed on cavalry movement begot the trench; for had cavalry been able to move, the construction of entrenched fronts would have been all but impossible. This fact presents the student of war with a tactical clue to the revival of cavalry in the future, and to follow up this clue it is necessary to understand the past history of the mounted arm.

Cavalry Tactics.—The two most primitive types of soldier are the foot-soldier and the horse-soldier, the first being characteristic of early European warfare, and the second of early Asiatic, since in southern Europe, that is, in the countries south and west of the Danube and the Rhine, few suitable breeds of war horses existed. Hence the poverty of Roman cavalry and of early Grecian cavalry. When infantry met infantry battles were decided by numbers, or armament, or discipline; and when cavalry met cavalry, as in Scythia, battles were seldom decided at all, degenerating as they normally did into skirmishes, forays and scattered pursuits. In hilly country, such as most of Greece, cavalry were normally impotent to attack infantry, as is exemplified in the Graeco-Persian Wars (490–479 B.C.); whilst in open plain

land, so frequently found in Asia Minor, they could destroy infantry by besieging them in the field, as happened to Crassus, at Carrhae in 53 B.C. The truth of the matter is that the two arms are complementary, each providing the other with powers not inherent in either separately. Infantry in an advance are useless unless their rear services are protected, and so also are cavalry in the advance, unless the positions won by them can be held so that their forward movement may not be interrupted. The art of an advance through a hostile country has always pivoted on the power of pushing forward a secure and movable base in order to develop from it offensive power. Once infantry and cavalry are combined, the first form the movable base, and the second provide the offensive power. The first may be compared to a cannon, and the second to a shell. The shell is fired from the cannon, but if the area to be crossed is extensive, the cannon must constantly be moved forward. In itself the cannon possesses blasting effect, and in itself the shell possesses local explosive effect; it is only when the two are combined that the full power of the shell is developed. So also with the short range power of infantry and the long range power of cavalry, they are interdependent.

When the advance merges into the attack, three targets present themselves, namely, the enemy's infantry, his cavalry and his baggage train. If the third can be seized and held, the severest possible blow is dealt the enemy's organization, consequently the supply services are well protected by the battle front. Infantry can oppose infantry frontally, but if attacked in flank, or rear, by infantry or cavalry, they are taken at a tremendous disadvantage. Throughout history flank protection has been furnished by cavalry. The infantry front may then be pictured as a slowly moving wall behind which are assembled the supply services, and on the flanks of which are hinged two cavalry wings, which, like doors, can swing forwards and backwards, "flapping" away any hostile force which may attempt to raid the baggage train, or attack the infantry in rear. In battle, the first problem is, therefore, the destruction of one or both of the hostile cavalry wings, for when once the opposing infantry wall is bereft of its swinging doors, not only do its flanks become attackable, but also its rear. If, meanwhile, its front can be so firmly held that it is unable to change front, a cavalry attack on its flanks, or rear, is likely to prove decisive. In brief, the object of infantry is to provide a base of operations for cavalry, and the power of cavalry is to be sought, first in ability to overcome their like, and secondly in being able to develop a sufficiency of speed so as to circumvent an infantry front, and attack it in rear before it can face about, which, in the case of an organized army, is an extremely difficult and dangerous operation; impossible if the front is firmly held. The student of military history will consequently find that only when organization, tactics and leadership were such as to allow of the mobility of cavalry being rapidly developed from the stability of infantry has war flourished as an art, and that when this has not been possible it has degenerated into a dog-fight. We will now consider the history of the cavalry arm.

The Classical Age, 490 B.C.–A.D. 378.—During the early classical age tactical organization was based on the nature of the country rather than on any idea of weapon co-operation, or combination between the arms. Thus, in Sparta we find practically no cavalry, whilst in Scythia mounted bowmen alone exist. Nevertheless, immediately the Asiatic horsemen came into contact with European foot-soldiers, as took place in the 5th century B.C., the problem of tactical co-operation, namely, how to equip, arm and manoeuvre a body of men so that offensive power may be developed from a protective base was thrust to the fore. This problem was solved by Philip of Macedon, and proved out by his son Alexander the Great.

The backbone of Philip's army was the phalanx, or infantry mass. Armed with the Sarissa, a pike from 18 to 21 ft. long, it formed an impenetrable hedge of spears to cavalry attack, though it offered a somewhat vulnerable target to archers both mounted and on foot. To protect it from these, numbers of lightly armed infantry were attached to it, their duty being very similar to that of the British light infantry during the Peninsular War in Spain at the beginning of the 19th century. Recognizing the strong pro-

tective and resisting power which the phalanx possessed, Philip was one of the first among the ancients to grasp the fact that stability of organization alone is insufficient to guarantee the act of disruption being followed up by the act of annihilation. The phalanx could not pursue without breaking its formation, it was not armed for the pursuit, and in the pursuit, the pursued almost invariably moves faster than the pursuer, whether both be on foot or mounted. To render the act of annihilation possible, Philip added to the phalanx a superb force of cavalry in the proportion of one trooper to every six heavy foot soldiers. This cavalry he organized in three bodies: Heavy armoured cavalry for the charge, his Companion cavalry being the most notable corps; light cavalry, or Hussars, for reconnaissance and out-post work, and Dragoons who could fight on foot, or on horseback. His heavy cavalry doctrine was profoundly simple—horse and rider combined were used as a "projectile" against the enemy once he was held by the phalanx, when the object of his cavalry became the annihilation of all resistance. The tactics which his son developed from this organization were equally simple, and astonishingly effective. Advancing in parallel order to his enemy, he obliqued his right, bringing it forward, and whilst his centre, protected on its left by the left cavalry wing, held the enemy to his ground, he delivered a series of terrific punches at his opponent's centre, or left, with a view to penetrate or envelop. At the battles of the Granicus (334 B.C.), Issus (333 B.C.), and Gaugamela (331 B.C.) his Companion cavalry decided the day, and at the battle of the Hydaspes (327 B.C.) his cavalry so completely dislocated the Indian Army that his phalanx was able to disrupt it.

From the days of Alexander onwards, cavalry, on account of their mobility, became the decisive arm. Hannibal's use of cavalry was superb, as the battles of the Trebbia (218 B.C.) and of Cannae (216 B.C.) testify. In both of these the Carthaginian cavalry completely dislocated the Roman legions by a rear attack. In the Roman armies the lack of good cavalry proved their ruin, and it was not until such a force was raised and trained by Scipio Africanus that the Carthaginians were eventually defeated at the battle of Ilipa (205 B.C.), and annihilated at that of Zama (202 B.C.). At Ilipa Scipio beat Hasdrubal by a double envelopment carried out by infantry and cavalry, and at Zama he smashed Hannibal by holding him in front with infantry and striking him in rear with cavalry.

During the days of Julius Caesar, the most serious defeat sustained by the Romans was that of Crassus at the hands of Surena, the Parthian general, whose entire force was composed of mounted archers and heavy cavalry. The Parthians, adopting an improved form of Scythian tactics, won a decisive victory; of the 40,000 Romans who crossed the Euphrates 20,000 were killed and 10,000 made prisoners. The Parthian success was due to the inability of the Romans to develop offensive power from a moving base. Their organization did not enable them to ward off shock and envelopment, whilst that of their enemy did permit of them enveloping and charging; for in this battle their heavy cavalry provided the necessary stability for the attack of their mounted bowmen and the distraction effected by this attack enabled the heavy cavalry of the Parthians to dislocate and disrupt the Roman legions.

From the battle of Pharsalus (48 B.C.) the legion learnt for a space how to hold its own against cavalry, mainly by employing cavalry. Under Diocletian (A.D. 245–313) cavalry rose from one-tenth to one-third of the infantry, and numbered some 160,000; but this great mass of horse was withdrawn from the infantry, and by being formed into a frontier guard it lost its offensive spirit. Meanwhile a steady decline took place in the infantry, mercenaries were enlisted, discipline was relaxed, pay increased and armour discarded because of its weight. Vegetius, who probably wrote in the days of Valentinian II. (375–392) urged its restoration; he says: "Those who find the old arms so burdensome must either receive wounds upon their naked bodies and die, or, what is worse still, run the risk of being made prisoners, or of betraying their country by flight. Thus, to avoid fatigue, they allow themselves to be butchered shamefully like cattle." This

separation of infantry and cavalry was the main tactical cause of the decline of Rome's military power. The unsupported Roman cavalry, trained as frontier police and for protective duties, were no match for the fierce barbarian horsemen who were now distracting the empire. From the first irruption of the Goths, in the year 248, the Roman cavalry were steadily increased until by the reign of Constantine (288–337) cavalry composed the principal part of the Roman armies; but all in vain. A few years later, Attila, king of the Huns, united Germany and Scythia, and at the head of a vast horde of barbarian horsemen he humiliated Rome. At the battle of Châlons, in 451, he was defeated by Aetius and Theodoric. This was the last victory won by Imperial Rome in the West, the dark ages now descended upon western Europe, and as far as war is concerned we enter the epoch of the iron-clad lancer.

The Cavalry Cycle, 378–1476.—In the history of tactics a cavalry cycle may be said to have been initiated at the battle of Adrianople, fought in 378, the emperor Valens and 40,000 men, mostly infantry, being annihilated by the Gothic horse which struck the Roman right flank "like a thunderbolt which strikes on a mountain top and dashes away all that stands in its path." Again at this battle the dislocation of the Romans, which heralded their disruption, was effected by a cavalry rear attack. Fifty-two years later the decisive victory of Tricameron was won over the Vandals in Africa purely by cavalry, and, a few years after this battle, Belisarius found so little use for his infantry that he mounted them to serve as Dragoons.

From the days of Justinian (483–565) to those of the fourth Crusade, which resulted in the sack of Constantinople (1204), highly organized armies comprising well-equipped heavy and light cavalry were maintained by the Eastern empire. In the West, however, military art virtually disappeared, and as principalities took form and feudalism was established the common folk were virtually prohibited from taking part in the "noble" trade of war, which was carried on by raiding and pillaging barons. As the military caste of this period was based on wealth, and as western Europe was largely roadless, cavalry remained the predominant arm, and sought perfection not through improved tactics, or organization, but through armour. By the opening of the 9th century the old military organization of Rome had been replaced by comparatively small bands of mailed knights followed by a mob of retainers who pillaged the countryside and so acted as "administrative units." In England, in the Low Countries and in Switzerland, infantry were still maintained, but were so ill-equipped that when confronted by cavalry in open, or even semi-open, country they were forced to seek protection behind palisades as was the case with the Saxons at Hastings (1066). Under Charlemagne the mail-clad knight was reaching his zenith, and, as is always the case when the peak of supremacy is topped, decline follows. To the knight of the middle ages the protective base of his offensive power was no longer afforded by the infantry mass, but by the armour he wore, his mobility being provided by his horse. As long as he was not met by equally well mounted and armoured antagonists this combination of mobility and protection proved tactically irresistible, yet seldom did it lead to profitable strategical results. But as soon as he was, it became neutralized, and with neutralization tactics as an art utterly deteriorated and were replaced by mob fighting.

This self-contained protective power of cavalry is most noticeable during the Crusades, for in spite of the low discipline of the Christian knights and their very rudimentary knowledge of tactics, normally their casualties were remarkably small. At the battle of Hazerth (1125), Baldwin lost only 24 men, whilst the Turkish losses amounted to 2,000; at Jaffa (1191) two Crusaders were killed on one side and 700 Turks on the other. The Crusaders, however, lost large numbers of horses, and as the rabble of beggars and vagrants who accompanied them were useless as infantry (further, the code of chivalry did not sanction their use), at times it became necessary for knights to fight on foot, or to abstain from fighting altogether. This involuntary change in tactics led to the Crusaders rediscovering the value of the protective infantry base as a mobile fortress from which the mounted

knights could sally forth. In 1248, we find St. Louis of France adopting this change intentionally. Near Damietta he landed his knights and drew them up on foot in order of battle to cover his disembarkation. The interesting point to note in these operations is that the action of these knights foreshadowed the approaching revival of infantry: "They formed up in serried ranks, placed their bucklers upright in the sand before them, and resting their long lances on the top of their shields, presented an impenetrable array of steel points, before which the Muslim horse fell back in confusion." One of the military influences of the Crusades was the weakening of feudalism through the rise of a commercial class made rich by buying up the knights' lands. This class was concentrated in the cities, and as early as 1057 we find Pavia and Milan raising armies of their own, largely composed of infantry.

Another result of increasing prosperity was the reintroduction of plate armour, which though it rendered the knight on foot practically invulnerable to infantry attack, when mounted, more and more did it sacrifice his mobility to protection. This seriously influenced the value of the dismounted base, for armour had become so heavy that the dismounted knight was unable to move far on foot. At the battle of Tagliacozzo (1268), Conradin's Ghibelline knights were so heavily armoured that Charles of Anjou's cavalry, after having exhausted them by repeated charges, rolled them out of their saddles by seizing them by their shoulders.

The progress in the construction of the bow and the crossbow was another reason for increasing the thickness of armour. At the siege of Abergavenny, in 1182, it is recorded that the Welsh arrows could penetrate an oak door four inches thick. No chain mail could withstand such a blow, consequently plate armour was worn over the mail shirt. As armour increased in weight natural obstacles began to play a decisive part on the battlefield. At Bannockburn (1314), Bruce took up his position behind a stream, and Edward II.'s knights got "bogged" just as tanks were "ditched" 603 years later in Flanders. When ground could not be crossed on horseback it had to be crossed on foot, and the knight deprived of his horse lost much of his tactical value, consequently an able enemy sought every means in his power to compel him to dismount. One of these means was choice of ground, another, archery; for horse armour never proved satisfactory.

At the battle of Dupplin Muir (1332), Baliol and Beaumont did not beat the earl of Mar by reckless charges, but by skilful weapon co-operation. The majority of their knights were dismounted and formed into a phalanx, the flanks of which were protected by archers, whilst 40 mounted knights were kept in reserve. The earl of Mar charged the phalanx which remained unshaken; his knights, immobilized by the archers on the flanks, were routed by Baliol's mounted squadron. This battle is the birth of a new era in tactics—the tactics of bow, pike and lance combined. It formed the mould in which all the English operations of the Hundred Years' War were cast, a war which proved disastrous to the gallant but insubordinate French chivalry, as the battles of Crécy (1346), Poitiers (1356), and Agincourt (1415) testify. The cavalry difficulty throughout was the armouring of the horse. At Crécy the horse proved the weak link in the French organization, for of the next great battle, namely Poitiers, we find John le Bel writing of the French knights: "Tous se combattoient a pyé, pour doubtaunce des archers qui tuoient leurs chevaux, comme a la bataille de Crécy" (All fought on foot, through fear that, as at the battle of Crécy, the archers would kill their horses.) Meanwhile in Switzerland infantry armed with pike and halberd, and fighting in phalangial order, were taking toll of German and Austrian chivalry; and in Bohemia, Ziska by employing wagons in laager created movable fortresses known as the Wagenburg (wagon fort) against which his enemy's cavalry shattered themselves in vain. As wealth increased, mercenaries once again came to the fore, and being professional soldiers whose pay as well as whose lives depended on their art, tactics once again began to assume a coherent form, especially under the English commander-in-chief of Pope Urban V., Sir John Hawkwood, who may be considered as the first great general of modern times. When cavalry met cavalry, on account of the protective power of armour, losses were

ridiculously small. Such battles as those of Zagonara (1423) and Castracaro (1467) are comparable to the engagement of the Merimac and the Monitor in 1862. Of the first Machiavelli writes: "In the great defeat famous throughout all Italy no deaths occurred, except those of Ludovico degli Obizi, and two of his people, who having fallen from their horses were drowned in the morass." The second of these two battles was even more bloodless, for he tells us: "Some horses were wounded and prisoners taken, but no death occurred."

From the battle of Poitiers onwards cavalry fell into a rapid decline; the French knights learnt nothing, and as the bow and pike destroyed them a new weapon arose in the crude bombards of the 14th century, which were destined to revolutionize the whole art of war, to reduce cavalry to the position they held in the days of the Scythians, and to advance infantry to the heyday of the Spartan phalanx. At the battle of Formigny (1450), three small culverins threw the English archers into disorder, and at Morat (1476) Charles the Bold of Burgundy was defeated by the Swiss who made good use of 6,000 hand guns.

The Revival of Cavalry, 1476–1763.—For 1,000 years cavalry had sought to solve the problem of mobility through protection by armour. This being no longer possible, because armour could be penetrated by the bullet, after much trial and error a solution was sought through fire-power (the very cause of its obsolescence), that is to say, by combining cavalry with the other arms. In 1494, Charles VIII. of France entered Rome, and in the words of Machiavelli: "He conquered Italy with a piece of chalk." Arming a tenth of his infantry with the escopette, a species of arquebus, and accompanied by 140 heavy cannon and a number of small pieces, nothing could resist him, and so all he had got to do was to chalk off areas on the map to which he wished to go, and there he went. Machiavelli (1469–1527) lays down that infantry is the real strength of an army. Of cavalry he writes in his "Treatise on the Art of War": "It is right, however, to have some cavalry to support and assist infantry, but not to look upon them as the main force of an army, and though they are highly necessary to reconnoitre, to scour roads, to make incursions and lay waste an enemy's country, to beat up their quarters, to keep them in continual alarm, and to cut off their convoys, yet in field battles, which commonly decide the fate of nations, and for which armies are chiefly designed, they are fitter to pursue an enemy that is routed and flying than anything else."

As armour grew lighter the knight exchanged his lance for the petronel, a type of hand cannon, in order to fire on infantry in place of charging them. This form of attack was first used by the French at the battle of Cerisoles, in 1544, and proved effective because the attack could be prolonged indefinitely, and against such organized Scythian tactics the infantry were powerless until the arquebus was improved, when cavalry became more immobile than ever. Soon the petronel was replaced by the arquebus-à-routet, and a little later on by the wheel-lock pistol, which was first used by the German cavalry at the battle of St. Quentin, in 1557.

The lance now vanished, and attempts were made to develop cavalry mobility by mixing squadrons with infantry units. As early as the battle of Pavia (1525), the Marquis of Pescara had adopted this organization, and though in a clumsy way it linked fire-power and shock, the mobility of cavalry was so limited by the pace of the infantry that the cavalry attack was reduced to a walk. Twenty-five years after this battle, Marshal de Brissac mounted a number of his infantrymen on horseback, and the era of the modern Dragoon, or mounted infantryman, was initiated. Yet, in spite of all these changes, the ancient spirit of cavalry refused to be conquered, for, in 1586, we find Stowe relating of Sir William Russell: "He with his cornet charged so terribly that when he had broke his lance, he with curtle-axe so played his part that the enemy reported him to be a devil and not a man, for when he saw six or seven of the enemy together, thither would he, and so behaved himself with his curtle-axe that he would separate their friendship."

During the Thirty Years' War (1618–1648) a cavalry revival took form, cavalry mobility being sought not through their own fire power but through that of infantry, and especially artillery.

Supported by artillery, Gustavus Adolphus's cavalry rode forward, fired their pistols and charged home with the sword. At Breitenfeld (1631) and at Lutzen (1632) his cavalry played the decisive part. In England he was emulated by Cromwell—the battle of Grantham (1643) was decided by the sword, so was Marston Moor (1644), and so was Naseby (1645). In France the reversion to shock tactics was no whit behind-hand: Turenne favoured the *arme blanche*, and issued instructions to his cavalry to use the sword alone. The impetuous Condé did likewise, and so also Marshal Luxembourg at Leuze, in 1691. In Germany, however, Montecuculi still favoured fire-arms for cavalry; he considered the lance useless, and looked upon the horses of his Dragoons solely as a means of conveyance.

This change is truly astonishing, and cannot alone be attributed to the genius of such cavalry leaders as Pappenheim and Gustavus. The underlying reason for it is probably to be found in the universal adoption of the matchlock, and the consequent reduction of the pikemen. The matchlock was a slow-loading and unreliable weapon, especially in rainy weather when infantry are apt to be surprised in mist or fog. It was on such occasions as these that cavalry frequently proved themselves the decisive arm, up to the adoption of the percussion cap in 1839. A notable instance of this was the battle of Eylau (1807). During the 18th century the idea of the shock continued to grow. Marlborough used cavalry in mass. Blenheim (1704) was decided by cavalry, and so was Malplaquet (1708). In these battles are to be discovered the germ of the superb cavalry actions of Ziethen and Seydlitz, which characterized the Seven Years' War (1756–63). Charles XII. of Sweden carried the shock to its extreme. He prohibited the use of armour, raced over Europe, rode to death two horses whilst reviewing a regiment, and met an impetuous end at Pultowa (1709). Marshal Saxe, in a reasoned degree, emulated him.

Under Frederick the Great, cavalry once again reached its zenith, and out of 22 of his battles at least 15 were won by the cavalry arm working in close co-operation with gun and musket. In his regulations for cavalry Frederick wrote: "They will move off at a fast trot and charge at the gallop, being careful to be well closed together. His Majesty will guarantee that the enemy will be beaten every time they are charged in this way." The exploits of Seydlitz and Ziethen proved that Frederick was not wrong. Rosbach (1757) was a great cavalry victory, and so, in a lesser degree, was Zorndorf (1758). The secret of Frederick's success lay not only in the artillery preparation which heralded the charge, nor in his system of attack, but in the training of his troopers. He says himself: "Every horse and trooper has been finished with the same care that a watchmaker bestows upon each wheel of the watch mechanism." And be it remembered that shortly after he ascended the Prussian throne his cavalry were so indifferent that he wrote: "Die Cavallerie ist nicht einmal werth dass sie der Teufel weck holet." (The cavalry is not even worth the devil coming to fetch it away.)

The Decline of Cavalry, 1763–1871.—After the close of the Seven Years' War a decline set in. The war of American Revolution (1775–81) provides no example of outstanding cavalry work, nor do the French Revolutionary Wars, except for the brilliant charge of the English 15th Hussars at Villers-en-Couche (1794), where some 300 British and Austrian cavalry charged and routed 10,000 French infantry and cavalry, driving them into Cambrai with a loss of 1,200 men. The slowing down of the shock first became perceptible in Bonaparte's campaign in Egypt, when the world-famed Mameluke cavalry failed to make any real impression on his infantry squares. At Mount Tabor (1799) 6,000 French infantry under Kléber gained a decisive victory over 30,000 Turks and Mamelukes. From this battle onwards to the World War of 1914 the declining power of cavalry remains constant.

Napoleon relied on all arms but particularly on fire power, and in spite of the many cavalry charges executed during his wars, his cavalry were pre-eminently a strategic force for observation and protection, and a tactical force for pursuit. It was only after the enemy was shattered by fire that pursuit was attempted, the most noted example being Murat's pursuit of the Prussians after Jena

(1806). Against well trained and unbroken infantry the cavalry charge failed, witness the French charges at Quatre Bras and Waterloo (1815). The Napoleonic wars were followed by 40 years of profound military coma. In 1823, Capt. John Norton, of the 34th English Regiment, invented the cylindro-conoidal bullet. He received no encouragement, for the duke of Wellington considered that the Brown Bess could not be bettered, yet Norton's bullet was the greatest military invention since the flint-lock. In 1853, Capt. Minié, of the French army, invented a similar projectile. In England, Sir William Napier opposed its adoption as he considered that it would destroy the infantry spirit by turning infantry into "long range assassins." It was, however, adopted; it had a range of 1,000 yd., and it sealed the doom of the cavalry charge. The war in the Crimea (1854–55) taught soldiers nothing as regards cavalry except their misuse and their gallantry. On its completion cavalry had fallen into such low repute that suggestions were made in England to abolish this arm altogether. The old feudal spirit was, however, too strong, the cavalry surviving all attacks.

In the next war, the Civil War in America (1861–65), cavalry once again became mounted infantry. Charges were carried out, but with the revolver, cavalry tactics approximating somewhat to those in vogue in the early 17th century. Morgan openly jeered at the sword: "Here, boys," he shouted, "are those fools coming again with their sabres (Federal cavalry); give it to them," and the saddles were emptied. Morgan with his mounted riflemen, a force which never exceeded 4,000 all told, killed as many of the enemy and captured 15,000 of them. The Federal sabres accomplished nothing, but the Dragoons much. Stuart waltzed round McClellan at Richmond, and beat the Federals at Brandy Station in 1863.

In spite of the fact that during four years of warfare, Morgan, Stuart, Mosby, Wilson, Forrest and Sheridan had proved the lance and sabre to be as obsolete as the stone axe of neolithic man, the 1866 Austro-Prussian War saw 56,000 cavalymen armed with these weapons, and this in face of the breech-loading needle-gun and the Minié rifle. At Nachod there was a cavalry skirmish; a little later on Col. Bredow charged an ammunition train; at Königgratz the Austrians were decisively defeated, and the Prussian cavalry impetuously charged the retreating infantry. "These, though running, still maintained their formation, and turned when the horsemen came too close, to stand and deliver volleys, which drove them back with many a saddle emptied."

In spite of Königgratz, the Franco-German War (1870–71) saw 96,000 cavalry take the field. The French had learnt nothing regarding cavalry tactics since Waterloo, and had forgotten everything regarding them prior to this date. The Germans were bold and pushful. They used their cavalry strategically with considerable effect, covering their own movements and discovering those of the enemy. The charge all but ceased to take place. Marguerite failed, Bredow succeeded, but at what cost? His is the last successful massed cavalry charge in military history. Sheridan, probably the greatest cavalry soldier of the American Civil War, witnessed the charge of Marguerite's Chasseurs d'Afrique at Sedan. It was in his opinion a most skilful charge, nobly carried out, the ground was most suitable; the Prussians simply waited until the horsemen were 150 yards away, and then mowed them down with volleys—it was not war, but cold-blooded assassination.

From this point of view of the art of war, cavalry tactics end with the introduction of the single-shot breech-loading rifle. They end by leaving cavalry still an arm of strategic importance, but tactically, except as mounted infantry, useless. Fire power has rendered impossible their tactical mobility in action. Cavalry can no longer charge home, and they cannot carry bullet-proof armour. Except in skirmishes against each other there is no shock action, and thus, in the last quarter of the 19th century they found themselves back in the year 329 B.C., when the Scythian horsemen surged round Alexander at the ford over the Jaxartes, but dared not approach him. Stability in cavalry has now completely disappeared, and cannot even be provided by infantry, or artillery, save in most exceptional circumstances, and without defensive power cavalry offensives become impossible.

Cavalry, 1871–1918.—The Franco-German War was followed

by a military intellectual revival, which though, as years passed by, losing touch with reality, never forsook the study of the theory of war. The coma into which all armies had fallen after the Napoleonic Wars was unknown, for in place of removing the war tumor from the European body, the war of 1870 stimulated its growth in the form of a united Germanic empire. The universal study of Napoleon's campaigns which followed this war, accentuated out of all proportion the value of cavalry as the strategic arm, far more attention being paid to its past exploits than to its future possibilities, which were obscured by a number of colonial wars in which cavalry could still play a spectacular part. These wars may be said to have culminated in the South African War of 1899-1902, a typically Scythian struggle between masses of mounted infantry who moved hither and thither, came and went, attacked and retired almost at will. Not until the British could stabilize the Boer horsemen, that is, restrict their mobility by constructing a network of block-houses, which simultaneously provided a base of operations for their own mounted infantry columns, was the war brought to a conclusion.

This war was followed by a severe criticism of cavalry, which was interrupted by the outbreak of the Russo-Japanese War (1904-05), which unhinged the military equilibrium of Europe by freeing Germany from Russian pressure. In Manchuria cavalry, though assembled in masses, particularly by the Russians, played an altogether insignificant part, and though after this war cavalry was once again severely criticized, the cavalry school of thought carried all before it by means of a most astonishing defence. It was asserted that in no single campaign since the days of Napoleon had conditions governing cavalry encounters been normal. South Africa and Manchuria were set aside as abnormal countries. In Europe it was declared that conditions would impose upon armies "a rapid marching campaign in the Napoleonic style, and in such warfare there is neither time nor energy available for the erection of extemporized fortresses. Victory must therefore fall to the side that can develop the greatest fire power in the shortest time. The greatest factor of fire power is the long artillery lines, and as cavalry is the one arm which by its mobility can hamper or prevent the formation of such lines, on its success in this task all else must depend. . . . The cavalry which will succeed in this task will be the one in which the spirit of duty burns brightest, and the oath of allegiance, renewed daily on the cross of the sword, is held in the highest esteem." The theory underlying this amazing defence was absolutely sound. If the enemy could be deprived of his guns the war was won and there would be no entrenchments. But as lines of guns would be protected by lines of infantry, and as cavalry could not even, as early as 1866, face infantry when on the run, how they were going to face and defeat the magazine rifle and the machine gun in the next war was relegated to that mystical receptacle—the adytum of God-nourished silence. Then came the Balkan Wars of 1912-13, which again were declared to be abnormal operations, and a year later the World War, which soon proved itself, from the point of view of the cavalry school, to be the most abnormal war ever fought.

In 1914 masses of cavalry once again took the field. The British produced one cavalry division, the French and Germans ten apiece, and the Russians 24. In this war, which was pre-eminently a war of trenches, one of the most perplexing riddles in military history is the abnormal growth of cavalry. In Aug. 1914 the British cavalry and yeomanry numbered 42,000, by July 1916 this figure exceeded 135,000, and in Nov. 1918 it fell to 74,000. In Russia the original 756 squadrons were raised to 1,277, an equivalent of 54 cavalry divisions, without counting numerous corps and divisional cavalry allotted to all infantry formations. So congested did the Russian railways become with the transport of forage, that it was found impossible to feed the troops. This was one of the main military causes which led to the Revolution.

In 1916, there must have been assembled on all fronts over 1,000,000 horsemen, and such an inundation of cavalry, never before seen in history, cannot be explained away by the fact that in most armies cavalry generals were in the ascendant, and carried the greatest weight. The reason was that the tactical idea which

underlay each great battle fought was theoretically sound, but on account of conditions impossible practically. This idea was the development of mobility from a protective base. In the British army, throughout the war commanded by cavalry generals, this impracticable theory was rigidly maintained until July 1918. Each great battle, the Somme (1916), Arras (1917), Ypres (1917) and Cambrai (1917) was founded on the idea of cavalry pursuit after the enemy's front had been penetrated by artillery and infantry attack. In fact, all these attacks were to be but preludes to a general cavalry advance on Napoleonic, 1806, lines.

In 1914 the five cavalry divisions allotted to the German right wing utterly failed in their mission, nor would they have succeeded had they been reinforced by the remaining five allotted to the left wing and centre; for had this been done, it would have been impossible to have supplied them with forage, unless whole corps of infantry had been removed. The French cavalry under Sordet, 18 regiments in all, advanced to within a few miles of Liège, accomplished nothing, fell back to the Marne, and then, on Sept. 9, advanced and entered Senlis, but only after it had been "nettoyé d'Allemands" (cleared of Germans). In 1918, Ludendorff attributed his failure on the Western Front to lack of cavalry. He said: "Without cavalry it is impossible to reap the fruits of victory"—it was the nightmare of a Murat dreamt in a machine-gun factory. At last, in September, 1918, the goal was gained, for cavalry conditions became normal in Palestine. There, they had little to do with the ground, or the theatre of war, the old bugbears of the cavalry school, but everything with the state of the enemy. The Turks were virtually down and out, demoralized, half-fed, short of ammunition, guns and shells, and without aeroplanes. They were confronted by Gen. Allenby who concentrated against their right flank, held by 8,000 rifles and 130 guns, a force of 35,000 rifles, 383 guns and three cavalry divisions. Though the numerical superiority of the British was formidable, and their moral superiority overwhelming, the importance of this battle lies in its idea, and this idea can never be belittled by any comparison of numbers or virtues. It was to hold the Turkish front, smash the Turkish right, and pass the cavalry through the gap created by the object, not of attacking the Turks in flank, but in rear. The cavalry attack, freed from all air attack, was not made against the body of the enemy's army but against his headquarters, supply centres, railways and lines of communication. Once these were seized, the whole of the Turkish forces were completely dislocated, total disruption and destruction following; for, within 14 days of the attack being launched, the enemy, having lost 100,000 prisoners and 500 guns, ceased to exist. In the tactics of this remarkable battle the secret of the future of cavalry lies imbedded.

The Future of Cavalry.—Allenby's final success in Palestine was due to the fact that conditions were such that with the instruments at his disposal he was able to develop mobility from a protective base; his cavalry being fired like a projectile from a cannon—his artillery and infantry attack. The further this projectile penetrated the enemy's organization the more were his vitals damaged, and the more it became possible to carry out a general advance, and not merely a cavalry pursuit. On the Western Front conditions never permitted of this being done, and are unlikely to permit of it in any future war against any organized enemy, for organized forces will be the normal condition met with. To suppose otherwise is to turn tactics upside down, for no nation prepares to wage war against a demoralized and disorganized foe. This was the pivotal mistake of the old cavalry school who attempted to weigh out victory in terms of horseshoes.

If conditions cannot be changed, then the instrument must be modified; for it is the instrument which has to overcome conditions, and till it can overcome them tactics cannot flourish as an art. Since the World War, cavalry soldiers have not grasped this fundamental necessity for change. In place of seeking a solution to the eternal problem of movement, they have attempted to justify their existence, not on tactical grounds but on traditional predilections. In place of modernizing the Palestine campaign they have crystallized it and apotheosized it, until the worship of the horse has obliterated the reality of war which pivots on the

bullet—the horse and man-killer. The result is that though in all armies cavalry has been drastically cut down, no replacement worth considering of this essential arm by some modernized counterpart has been attempted.

The answer to the bullet is obviously armour. To-day, practically all armies possess armoured cars to co-operate with cavalry, who are to discover the enemy so that the infantry may attack him. There would, however, appear, at present, to be no idea of using them decisively, that is of attacking with infantry, not in order to destroy the enemy by such an attack, a most costly method of waging war, but of holding the enemy in order to develop from this operation an armoured car, that is mechanized cavalry, attack on the enemy's rear. Obviously, for such tactics, the armoured car, even if a multi-wheeled machine, suffers from certain definite limitations. It will normally be tied to road attack, and it will not be able to cross really difficult ground. Nevertheless, a study of the astonishing operations carried out by the 17th British Armoured Car Battalion (Tank Corps) during the World War, ought to convince the most sceptical of the feasibility of attacking an enemy's rear with these weapons. Should an enemy be held, then, if a swarm of armoured cars is launched on his rear; with these modernized Parthians shall we see battles, like the battle of Carrhae, repeat themselves?

Once mechanized cavalry realize this, we shall gradually see the old cavalry idea replace the existing infantry idea as the tactical pivot of battle. Further still, as mechanization becomes general, the modern Parthians will be confronted by their like, and to overcome their like they will demand not only more and more powerful machines, but machines which are freed entirely from road movements. This will mean that to light mechanized cavalry, those equipped with armoured cars, will be added heavy mechanized cavalry, those equipped with a very fast tank—a machine which freed of roads can move and manoeuvre across country, and attack the enemy's combatants themselves in flank or rear. When this becomes possible, then the present tactical pivot will be entirely replaced by the old cavalry one. It will be with mechanized cavalry that all arms will co-operate. The mobility of the historic arm will be revived and to it will be added the offensive power of artillery. Fast moving armoured machines, equipped with guns, will operate from a more strongly armoured and less fast moving base, a mobile fortress which can engage the enemy and hold him, and through holding him enable the mechanized cavalry to sally forth and attack the enemy at the decisive point—his rear. The art of war will be rehabilitated; it will once again become an art in the full meaning of the word, and cease to be a dog-fight. The instruments of war, the arms themselves, being artistically designed and artistically set together, great artists of war will once again appear, for it is environment which liberates genius. In the World War, had all the Great Captains of the past, in turn, tried their hand at it, the result must have been the same, namely, battles of brute-force and of attrition, because none with the clumsy instruments existing could have solved that fundamental cavalry problem—the development of mobility from a protective base.

CAVAN, FREDERICK RUDOLPH LAMBERT, 10TH EARL OF (1865–), British general, was born Oct. 16, 1865, and succeeded to the title in 1900. Commissioned in the Grenadier Guards 1885, he was A.D.C. to the governor-general of Canada 1891–93; served in the South African War 1901. Retiring from the army in 1913, he was recalled in Aug. 1914 and in Sept. went out to France to take command of the 4th (Guards) Brigade. In June 1915 he was promoted to command of the 50th Division, and in Aug. to the Guards Division. Winning a reputation as a trusted and admired fighting commander, his next step was the command of the IV. Army Corps at Ypres, which he held from Jan. 1916 to March 1918, when he was appointed to succeed General Plumer as commander-in-chief of the British Forces on the Italian front. A notable mark of trust was that the Italian command put him in charge of the X. Italian Army for the final offensive. It was through the initial forcing of the passages of the Piave by the mixed British and Italian troops under his command that the way was paved for the decisive successes which followed. Remaining on the active list after the War, Lord Cavan was appointed to the Aldershot command in 1920 and in 1922 was advanced to be chief of the Imperial General Staff, a unique distinction in that a retired officer was not only brought back to the active list but became the chief of the army. Cautious, perhaps, in his attitude to military progress and new weapons of warfare, he was a tranquilizing influence rather than a driving force. But in view of the political war weariness and military soreness which prevailed during the first stages of rebuilding the regular army, the former quality was an unquestionable aid in paving the way for subsequent reforms. He retired in 1926.

CAVAN, a county in the province of Ulster, Ireland, bounded north by Fermanagh and Monaghan, east by Monaghan and Meath, south by Meath, Westmeath and Longford, and west by Longford and Leitrim. Area 477,399 acres; pop. (1926), 82,447.

In the north-west is a mountainous district of millstone grit rising in Cuilcagh to a height of 2,188 ft. The source of the Shannon is thought to be near here. The central portion of the county is a low-lying area of carboniferous limestone, covered by numerous lakes, the most important of which is Lough Oughter, and drained chiefly by the river Erne. The land to the south-east is hilly and irregular and here are encountered the underlying Silurian strata that run from Longford to Donaghadee in Co. Down.

For some centuries after the English settlement this district was known as the Brenny, being divided between the families of O'Rourke and O'Reilly; and its inhabitants, protected by the nature of the country, long maintained their independence. In 1579 Cavan was made shire ground as part of Connaught, and in 1584 it was formed into a county of Ulster. The county subsequently came within the scheme for the plantation of Ulster under James I. Some few remains of antiquity exist in the shape of cairns, raths and the ruins of small castles, such as Cloughoughter castle on an island (an ancient crannog) of Lough Oughter. Three miles from the town of Cavan is Kilmore, with its cathedral, a plain erection containing a Romanesque doorway brought from the abbey of Trinity island, Lough Oughter. The bishopric dates from about 1450.

The climate suffers from dampness arising from the numerous lakes. The soil is generally a stiff clay, cold and watery, but capable of much improvement by drainage, for which its undulating surface affords facilities. Only about $\frac{1}{10}$ of the total area is quite barren. The farms are generally small; oats and potatoes are the principal crops. Flax, once of some importance, is almost neglected. In the higher lands are larger grazing farms which are fairly prosperous.

Cavan is not a manufacturing county. The bleaching of linen and the distillation of whisky are both carried on to a small extent, but the people are chiefly employed in agricultural pursuits and in the sale of home produce. The soil in those districts not well adapted for tillage is peculiarly favourable for trees. The woods were formerly very considerable, and the timber found in the bogs is of large dimensions; but plantations are now chiefly found in extensive demesnes.

The absence of large urban centres is reflected in the limited railway development. The Great Northern railway from Clones to Cavan and the Great Southern railway from Mullingar in Westmeath to Cavan form a through line from north to south. The Great Northern has branches to Belturbet from Ballyhaise, and to Cootehill from Ballybay; the former is continued westwards by the Great Southern railway which has branches also to Killashandra, and from Navan in Meath to Kingscourt. Cavan returns four members to the Dáil Eireann.

CAVAN, urban district and county town of Co. Cavan, Ireland, 8½ m. N.W. of Dublin by the Great Southern railway and the terminus of a branch of the Great Northern of Ireland from Clones. Pop. (1926) 3,056. A Dominican monastery founded by O'Reilly, chieftain of the Brenny, formerly existed here and is the burial place of Owen O'Neill. There was also a castle of the O'Reillys now completely destroyed. The town was burnt in 1690 by the Enniskilleners under Wolseley when they defeated James II.'s troops under the duke of Berwick. There is a grammar school founded by Charles I. and rebuilt on another site in 1819. The town has some linen trade.

CAVANILLES, ANTONIO JOSÉ (1745-1804), Spanish botanist, was born in Valencia on Jan. 16, 1745. In 1801 he became director of the botanic gardens at Madrid, where he died on May 4, 1804. In 1785-86 he published *Monadelphiae Classis Dissertationes X.*, and in 1791 he began to issue *Icones et descriptiones plantarum Hispaniae*.

CAVATINA, originally a short song of simple character, without a second strain or any repetition of the air. It is now frequently applied to a simple melodious air, as distinguished from a brilliant aria, recitative, etc.

CAVAZZOLA or CAVAZZUOLA, PAOLO MORANDO (1486-1522), Italian painter of the Veronese school, a pupil of Domenico Morone. He worked at Verona, where he decorated many churches with frescoes (San Nazzaro e Celso, S. Anastasia, S. Chiara, S. Eufemia, S.M. in Organo). His earliest dated work extant was painted in 1508 (Villa Gazzada near Varese). The master is seen at his best in the series of pictures, five in number, which treat of the "Passion," formerly in the church of S. Bernardino and now in the Verona gallery. The series was completed in 1517. Nowhere outside Verona is he so well represented as in the National Gallery, London (which contains two signed pictures, the "St. Roch with the Angel" (1918) and the "Madonna, St. John the Baptist and an Angel." There are also some fine portraits extant (Dresden gallery; Uffizi; Bergamo). The great altarpiece of the Madonna with six saints and with the portrait of the donor, Caterina de Sacchi, is his last work. He died on Aug. 13, 1522, and was buried in St. Polo at Verona. Vasari gives as reason for his premature death that he had set his heart on becoming great, and, working hard, undermined his health. Cavazzola's contemporaries hailed him as the Raphael of the school of Verona.

CAVE, EDWARD (1691-1754), English printer, was born at Newton, Warwickshire, on Feb. 27, 1691, and died on Jan. 10, 1754. He entered the grammar school at Rugby, where his father was a cobbler, but was expelled for robbing the master's hen-roost. After many vicissitudes he became apprentice to a London printer and was sent to Norwich to conduct a printing house and publish a weekly paper. While still a printer he obtained a place in the post office, and was promoted to be clerk of the franks. He was at this time engaged in supplying London news-letters to various country papers; and his enemies, who had twice summoned him before the House of Commons for breach of privilege, now accused him of opening letters to obtain his news, and he was dismissed from the service. He then set up a small printing office at St. John's Gate, Clerkenwell, which he carried on under the name of R. Newton. He had long formed a scheme of a magazine "to contain the essays and intelligence which appeared in the two hundred half-sheets which the London press then threw off monthly." In 1731 he put it into execution, and began the *Gentleman's Magazine* (see PERIODICALS), of which he was the editor, under the pseudonym "Sylvanus Urban, Gent." In 1732 he began to issue reports of the debates in both Houses of Parlia-

ment, and in 1738 he was censured for printing the king's answer to an address before it had been announced by the speaker. From that time he called his reports the debates of a "parliament in the empire of Lilliput." To piece together and write out the speeches for this publication was Samuel Johnson's first literary employment. In 1747 Cave was reprimanded for publishing an account of the trial of Lord Lovat, and the reports were discontinued till 1752. Cave published Dr. Johnson's *Rambler*, and his *Irene*, *London* and *Life of Savage*, and was the subject of a short biography by him.

CAVE, GEORGE CAVE, 1ST EARL (1856-1928), English lord chancellor, was born in London on Feb. 23, 1856, and educated at Merchant Taylors' school, London, and St. John's college, Oxford. Called to the bar in 1880, he became K.C. in 1904. In 1906 he entered parliament as Conservative member for Kingston. In 1915 he became solicitor-general and was knighted. On the formation of the first Coalition Government, in 1916, he was appointed home secretary. In 1918 he was appointed a lord of appeal in ordinary, and received a viscountcy. He sat more frequently at the privy council than in the House of Lords, often presiding over the judicial committee of the council, where he showed a great mastery of the intricate points of law, especially of those arising out of Indian appeals. Cave was lord chancellor in Baldwin's first and second Administrations of 1922 and 1924. As lord chancellor he displayed the reasonableness, the dignity and learning which had characterized him throughout his long career. But in his second term of office his health suffered and on March 27, 1928, he resigned. Next day his advance to an earldom was announced; he died on the following day. Cave sat on many government enquiries and committees, and received many academic and other honours.

CAVE, WILLIAM (1637-1713); English divine, was born at Pickwell, Leicestershire. He was educated at St. John's college, Cambridge, and successively held the livings of Islington (1662), of All-Hallows the Great, Thames street, London (1679), and of Isleworth in Middlesex (1690). Dr. Cave was chaplain to Charles II. and in 1684 became a canon of Windsor. His principal works are the *Apostolici*, or History of Apostles and Fathers in the first three centuries of the Church (1677), and *Scriptorum Ecclesiasticorum Historia Literaria* (1688). The best edition of the latter is the Clarendon Press, 1740-43. He died at Windsor on July 4, 1713.

CAVE, a hollow extending beneath the surface of the earth (Lat. *cavea*, from *cavus*, hollow). The word "cavern" (Lat. *caverna*) is a synonym. Caves have been the centres round which have clustered many legends and superstitions, the abode of the sibyls and the nymphs in Roman mythology, in Greece temples, as well as the places where the oracles were delivered.

Caves have been used in all ages by mankind for habitation, refuge and burial. Sanctity attaches to caves in many parts of the world as the abode of powerful spirits, while their use as burial places confers a special importance upon them, since intercourse with the dead, especially those who in life were powerful and eminent in social life, necessarily takes place in proximity to the burial place. Legends like those of Arthur cluster round the caves wherein the hero sleeps his long sleep, whence he shall emerge in due course to a greater glory and a wider empire. We therefore find in them most important testimony as to the ancient history of mankind because they contain evidence of his industry, his mode of life, his ideas and his artistic capacity as well as of the plant and animal world in which he lived (see ARCHAEOLOGY: *Palaeolithic Age*), and animals by which they were formerly inhabited. Caves are frequently considered, among primitive peoples, as the passages to the underworld and as the homes of dead heroes. The names given to caves betray the beliefs of the peoples who name them in the mysterious other-worldliness of these caverns.

Physical History.—The most obvious agent in hollowing out caves is the sea. The set of the currents, the force of the breakers, the grinding of the shingle inevitably discover the weak places in the cliff, and leave caves as one of the results of their work, modified in each case by the local conditions of the rock. Those

formed in this manner are easily recognized from their floors being rarely much out of the horizontal; their entrances are all in the same plane, or in a succession of horizontal and parallel planes, if the land has been elevated at successive times. From their inaccessible position they have been rarely occupied by man.

An important class of caves is that composed of those which have been cut out of calcareous rocks by the action of carbonic acid in the rain-water, combined with the mechanical friction of the sand and stones set in motion by the streams which have, at one time or another, flowed through them. They occur at various levels, and are to be met with wherever the strata are sufficiently compact to support a roof.

Caves formed by the action of carbonic acid and the action of water open on the abrupt sides of valleys and ravines at various levels, and are arranged round the main axes of erosion, just as the branches are arranged round the trunk of a tree. The caves themselves ramify in the same irregular fashion as the valleys. Sometimes they are still the passages of subterranean streams; but very frequently the drainage has found an outlet at a lower level, and the ancient watercourses have been deserted. These in every case present unmistakable proof that they have been traversed by water in the sand, gravel and clay which they contain, as well as in the worn surfaces of the sides and bottom. In all districts where there are caves there are funnel-shaped depressions of various sizes called pot-holes or swallow-holes, or bêtôires, "chaldrons du diable," "marmites des géants," or "katavothra," in which the rain is collected before it disappears into the subterranean passages. They are to be seen in all stages, some being mere hollows which only contain water after excessive rain, while others are profound vertical shafts into which the water is continually falling.

America has many caves, some of them picturesquely named by the Indians. For an account of the chief American caves see LURAY CAVERN, MAMMOTH CAVE, WYANDOTTE CAVE, COLOSSAL CAVERN, JACOB'S CAVERN.

CAVEA, a term applied both to the ranges of spectators' seats considered as a whole in a Roman amphitheatre (*q.v.*) and also, less commonly, to the cells for wild beasts underneath the arena.

CAVEAT, in law, a notice given by the party interested (caveator) to the proper officer of a court of justice to prevent the taking of a certain step without warning. It is entered in connection with dealings in land registered in the land registry, with the grant of marriage licences, to prevent the issuing of a lunacy commission, to stay the probate of a will, letters of administration, etc. Caveat is also a term used in United States patent law (see PATENTS).

CAVEAT EMPTOR, a Latin phrase meaning literally "Let the buyer beware." It represents a legal rule in the purchase and sale of personal property that the buyer purchases at his own risk in the absence of an express warranty, or unless the law implies a seller's warranty, or there is found to have been fraud in the transaction.

CAVEDONE, JACOPO (1577-1660), Italian painter, born at Sassuolo in the Modenese, was educated in the school of the Caracci, and under them painted in the churches of Bologna. His principal works are the "Adoration of the Magi," the "Four Doctors," and the "Last Supper"; and more especially the "Virgin and Child in Glory," with San Petronio and other saints, painted in 1614, and now in the Bolognese academy. Cavedone became an assistant to Guido Reni in Rome. He died at Bologna.

CAVELL, EDITH LOUISA (1865-1915), British nurse, was born Dec. 4, 1865, at Swardston, Norfolk. She entered the London Hospital as a probationer in 1895. In 1907 she was appointed the first matron of the Berkendael Medical Institute, Brussels, which became a Red Cross hospital on the outbreak of the World War. From Nov. 1914 to July 1915 wounded and derelict English and French soldiers were hidden from the Germans by Prince Reginald de Croy at his château near Mons, thence conveyed to the houses of Edith Cavell and others in Brussels, and furnished by them with money to reach the Dutch frontier, with the aid of guides obtained through Philippe Bauqc. On Aug. 5 Edith Cavell was arrested and imprisoned. She ad-

mitted having sheltered and helped to convey to the frontier some 200 English, French and Belgians. A court-martial was held (Oct. 7 and 8) and a Belgian lawyer, M. Sadi Kirschen, defended Edith Cavell. On Oct. 9 Edith Cavell and Philippe Bauqc were sentenced to death with three others who were afterwards reprieved. Despite efforts to obtain a reprieve in which Mr. Brand Whitlock, the U.S. Minister at Brussels, was active, Edith Cavell and Philippe Bauqc were shot on Oct. 12. Miss Cavell, who had tended many wounded German soldiers with devoted care, faced the firing squad with a dignity which moved the world. To the British chaplain who administered a final sacrament, she made the remark, "patriotism is not enough," which at once became as historic as Nelson's utterance at Trafalgar. On May 15, 1919 her body was removed to Norwich Cathedral, after a memorial service in Westminster Abbey. A memorial statue stands opposite the National Portrait Gallery, London.

See *The Case of Miss Cavell from the Unpublished Documents of the Trial*, interpreted by Ambroise Got (1920); Sadi Kirschen, *Devant les Conseils de Guerre allemands* (1919); *Correspondence with the United States Ambassador respecting the Execution of Miss Cavell at Brussels*, Cd. 8013, Stationery Office (1915).

CAVENDISH, GEORGE (1500-1562?), the biographer of Cardinal Wolsey, was the elder son of Thomas Cavendish, clerk of the pipe in the Exchequer. About 1527 he entered the service of Cardinal Wolsey as gentleman-usher, and for the next three years he was in the closest personal attendance on the great man. It is plain that he enjoyed Wolsey's closest confidence to the end, for after the cardinal's death George Cavendish was called before the privy council and closely examined as to Wolsey's latest acts and words. Many years passed before his biography was composed. At length, in 1557, he wrote it out in its final form. It was impossible to publish it in the author's lifetime, but it was widely circulated in ms. The book was first printed in 1641, in a garbled text, and under the title of *The Negotiations of Thomas Wolsey*. The genuine text, from contemporary mss., was first published in 1810. Until that time it was believed that the book was the composition of George Cavendish's younger brother William, the founder of Chatsworth, who also was attached to Wolsey; but Joseph Hunter, in a tract called *Who wrote Cavendish's Life of Wolsey?* (1814), proved the claim of George. The book is the sole authentic record of a multitude of events highly important in a particularly interesting section of the history of England. Its biographical excellence was first emphasized by Bishop Creighton, who insisted that Cavendish was the earliest of the great English biographers and an individual writer of particular charm and originality.

See the edition of the *Life* published by S. W. Singer in 1815, which was reprinted, with a biographical introduction, by Henry Morley in the Universal Library Series (1885). See also Francis Bickley, *The Cavendish Family* (1911).

CAVENDISH, HENRY (1731-1810), English chemist and physicist, elder son of Lord Charles Cavendish, brother of the 3rd duke of Devonshire, and Lady Anne Grey; daughter of the duke of Kent, was born at Nice on Oct. 10, 1731. He was sent to school at Hackney in 1742, and in 1749 entered Peterhouse, Cambridge, which he left in 1753, without taking a degree. He appears to have spent some time in Paris with his brother Frederick during the following years, and apparently occupied himself in the study of mathematics and physics. Until he was about 40 he seems to have enjoyed a very moderate allowance from his father, but in the latter part of his life he was left a fortune which made him one of the richest men of his time. He lived principally at Clapham Common, but he had also a town house in Bloomsbury, while his library was in a house in Dean street, Soho; and there he used to attend on appointed days to lend the books to men who were properly vouched for. He was a regular attendant at the meetings of the Royal Society, of which he became a fellow in 1760, and he dined every Thursday with the club composed of its members. Otherwise he had little intercourse with society; indeed, his chief object in life seems to have been to avoid the attention of his fellows. With his relatives he had little intercourse, and even Lord George Cavendish, whom he made his principal heir, he saw

FAMOUS CAVES THROUGHOUT THE WORLD

1. Carlsbad cave, national monument, New Mexico. The Giants' hall. The largest cavern in America and probably in the world
2. Great Onyx cave, near Mammoth cave, Kentucky
3. Carlsbad cave, national monument, New Mexico. The king's throne room
4. Caverns of Luray, Virginia, Leidy column, in the blanket room
5. Shenandoah caverns, Virginia. "The Castle of Cardross"
6. Caverns of Luray, Virginia. Helen's Shawl
7. Black Hills, South Dakota. Wind cave
8. Syracuse, Sicily. The Ear of Dionysius
9. Indian Chamber cave, Jenolan, N.S.W., Australia. The Orient cave

only for a few minutes once a year. His dinner was ordered daily by a note placed on the hall table, and his women servants were instructed to keep out of his sight on pain of dismissal. In person he was tall and rather thin; his dress was old-fashioned and singularly uniform, and was inclined to be shabby about the times when the precisely arranged visits of his tailor were due. He had a slight hesitation in his speech, and his air of timidity and reserve was almost ludicrous. He was never married. He died at Clapham on Feb. 24, 1810, leaving funded property worth £700,000, and a landed estate of £8,000 a year, together with canal and other property, and £50,000 at his bankers'. He was buried in the family vault at All Saints' church, Derby; in 1927 this church became the cathedral church of the new diocese of Derby and it was decided to erect a monument there to Henry Cavendish.

Cavendish's scientific work was wide in its range. The papers he himself published form an incomplete record of his researches, for many of the results he obtained only became generally known years after his death; yet the Institute of France in 1803 chose him as one of its eight foreign associates. His first communication to the Royal Society, a chemical paper on "Factitious Airs" (*Phil. Trans.*, 1766), consisted of three parts, a fourth part remaining unpublished until 1839, when it was communicated to the British Association by Canon W. Vernon Harcourt. This paper dealt mostly with "inflammable air" (hydrogen), which he was the first to recognize as a distinct substance, and "fixed air" (carbon dioxide). He determined the specific gravity of these gases with reference to common air, investigated the extent to which they are absorbed by various liquids, and noted that the air produced by fermentation and putrefaction has properties identical with those of fixed air obtained from marble. He introduced new refinements into his experiments, such as the use of drying agents and the correction of the volume of a gas for temperature and pressure. In the following year he published a paper on the analysis of one of the London pump-waters (from Rathbone place, Oxford street), which is closely connected with the memoirs just mentioned, since it shows that the calcareous matter in that water is held in solution by the "fixed air" present and can be precipitated by lime. In 1783 he described observations he had made to determine whether or not the atmosphere is constant in composition; after testing the air on nearly 60 different days in 1781 he could find in the proportion of oxygen no difference of which he could be sure, nor could he detect any sensible variation at different places. Two papers on "Experiments on Air," printed in the *Phil. Trans.* for 1784 and 1785, contain his great discoveries of the compound nature of water and the composition of nitric acid. Starting from an experiment, narrated by Priestley, in which John Warltire fired a mixture of common air and hydrogen by electricity, with the result that there was a diminution of volume and a deposition of moisture, Cavendish burnt about two parts of hydrogen with five of common air and noticed that the only liquefiable product was water. In another experiment he fired, by the electric spark, a mixture of hydrogen and oxygen in a glass globe, similar to the apparatus now called "Cavendish's Eudiometer," and again obtained water. Proceeding with these experiments he found that the resulting water contained nitric acid. In the second of the two papers he gives an account of the methods by which the composition of nitric acid was discovered; he observed also that a very small fraction, about one one-hundred and twentieth, of the "phlogisticated air" of the atmosphere differed from the rest, and in this residue he doubtless had a sample of the inert gas argon which was only recognized as a distinct entity more than 100 years later. It may be noted here that, while Cavendish adhered to the phlogistic doctrine, he did not hold it with anything like the tenacity that characterized Priestley; thus, in his 1784 paper on "Experiments on Air," he remarks that not only the experiments he is describing, but also "most other phenomena of nature seem explicable as well, or nearly as well," upon the Lavoisierian view, but he did not accept it and continued to use the language of the phlogistic theory. Experiments on arsenic, published for the first time in 1921, showed that Cavendish had investigated the properties of arsenic acid about ten years before Scheele.

Cavendish's work on electricity, with the exception of two papers containing relatively unimportant matter, remained in the possession of the Devonshire family until 1879, when the papers were edited by James Clerk Maxwell as the *Electrical Researches of the Hon. Henry Cavendish*. This work shows that Cavendish had anticipated the researches of Coulomb, Faraday and others. He investigated the capacity of condensers and constructed a series of condensers with which he measured the capacity of various pieces of apparatus using the "inch of electricity" as the unit of capacity. He discovered specific inductive capacity and measured this quantity; he showed that electric charges are confined to the surface of a conductor and that the inverse square law of force between charges holds to within 2%. Cavendish introduced the idea of potential under the name of "degree of electrification," in a paper published in 1771, under the title "Attempt to explain some of the principal phenomena of electricity by means of an elastic fluid." He investigated the power of different substances to conduct electrostatic discharges (*Phil. Trans.*, 1775) and completed an enquiry which amounted to an anticipation of Ohm's law.

Cavendish took up the study of heat, and had he published his results promptly he might have anticipated Joseph Black as the discoverer of latent heat and of specific heat. He published a paper on the freezing point of mercury in 1783 and in this paper he expresses doubt of the fluid theory of heat.

Cavendish's last great achievement was his series of experiments to determine the density of the earth (*Phil. Trans.*, 1798). The apparatus he employed was devised by the Rev. John Michell, though he had the most important parts reconstructed to his own designs. (See GRAVITATION.) The figure he gives for the specific gravity of the earth is 5.48, but in fact the mean of the 29 results he records works out at 5.448. Other publications of his later years dealt with the height of an aurora seen in 1784 (*Phil. Trans.*, 1790), the civil year of the Hindus (*Id.* 1792), and an improved method of graduating astronomical instruments (*Id.* 1809). Cavendish also had a taste for geology, and made several tours in England for the purpose of gratifying it.

A life by George Wilson (1818-59), printed for the Cavendish Society in 1851, contains an account of his writings, both published and unpublished, together with a critical enquiry into the claims of all the alleged discoverers of the composition of water. Some of his instruments are preserved in the Royal Institution, London, and his name is commemorated in the Cavendish Physical Laboratory at Cambridge, which was built by the 7th duke of Devonshire.

The remainder of Cavendish's papers were placed at the disposition of the Royal Society by the Duke of Devonshire. In 1921 the previously published work, together with a number of unpublished experiments, appeared under the title: *The Scientific Papers of the Honourable Henry Cavendish, F.R.S.; Vol. I., The Electrical Researches*, revised with preface and notes by Sir J. Larmor. *Vol. II., Chemical and Dynamical*, edited by Sir Edward Thorpe, with additions by Dr. Charles Chree and others.

CAVENDISH or CANDISH, THOMAS (1555?-1592), the third circumnavigator of the globe, was born in Trimley St. Martin, Suffolk, and educated at Corpus Christi college, Cambridge. In 1585 he accompanied Sir Richard Grenville to America. Soon returning to England, he undertook an elaborate imitation of Drake's great voyage. On July 21, 1586, he sailed from Plymouth with 123 men in three vessels, only one of which (the "Desire," of 140 tons) came home. By way of Sierra Leone, the Cape Verde islands and C. Frio in Brazil, he coasted down to Patagonia (where he discovered "Port Desire," his only important contribution to knowledge), and passing through Magellan's straits fell upon the Spanish settlements and shipping on the west coast of South and Central America and of Mexico. Among his captures was the treasure-galleon, the "Great St. Anne," which he captured off Cape St. Lucas, the southern extremity of California (Nov. 14, 1587). After this success he struck across the Pacific for home; touched at the Ladrões, Philippines, Moluccas and Java; rounded the Cape of Good Hope; and arrived again at Plymouth (Sept. 9-10, 1588), having circumnavigated the globe in two years and 50 days. It is said that his sailors were clothed

in silk, his sails were damask, and his top-mast covered with cloth of gold. Yet by 1591 he was again in difficulties, and planned a fresh American and Pacific venture. John Davis (*q.v.*) accompanied him, but the voyage (undertaken with five vessels) was an utter failure. He died and was buried at sea, on the way home, May 20, 1592.

See Hakluyt's *Principal Navigations*, (a) edition of 1589, p. 809 (N.H.'s narrative of the voyage of 1586-1588); (b) edition of 1599-1600, vol. iii. pp. 803-825 (Francis Pretty's narrative of the same); (c) edition of 1599-1600, vol. iii. pp. 251-253 (on the venture of 1585); (d) edition of 1599-1600, vol. iii. pp. 845-852 (John Lane's narrative of the last voyage, of 1591-1592); also *Stationers' Registers* (Arber), vol. ii. pp. 505-509; the Molyneux Globe of 1592, in the library of the Middle Temple, London, and the Ballads in *Bog. Brit.*, vol. i. p. 1196; E. S. Payne, *Voyages of the Elizabethan Seamen to America* (2 vols., 1893-1900).

CAVENDISH, SIR WILLIAM (c. 1505-1557), founder of the English noble house of Cavendish, was the younger brother of George Cavendish (*q.v.*). His father, Thomas, was a descendant of Sir John Cavendish, the judge, who in 1381 was murdered by Jack Straw's insurgent peasants at Bury St. Edmunds. Of William's education nothing seems known, but in 1530 he was appointed one of the commissioners for visiting monasteries; he worked directly under Thomas Cromwell, whom he calls "master," and to whom many of his extant letters are addressed. In 1541 he was auditor of the court of augmentations, in 1546 treasurer of the king's chamber, and was knighted and sworn of the Privy Council. Under Edward VI. and Mary he continued in favour at court; during the latter's reign he partially conformed, but on the occasion of the war with France he with other Derbyshire gentlemen refused the loan of £100 demanded by the queen. He died in 1557. Cavendish acquired large properties from the spoils of the monasteries, but in accordance with the wish of his third wife, Elizabeth, he sold them to purchase land in Derbyshire. This wife was the celebrated "building Bess of Hardwick," daughter of John Hardwicke, of Hardwicke, Derbyshire; she completed the original building of Chatsworth House,—begun in 1553 by her husband,—of which nothing now remains. Her fourth husband was George Talbot, 6th earl of Shrewsbury. By her Cavendish had six children; an elder son who died without issue; William, who in 1618 was created earl of Devonshire; Charles, whose son William became 1st duke of Newcastle; Frances, who married Sir Henry Pierpont, and was the ancestress of the dukes of Kingston; Elizabeth, who married Charles Stuart, earl of Lennox, and was the mother of Arabella Stuart; and Mary, who married Gilbert Talbot, 7th earl of Shrewsbury.

CAVETTO, in architecture, any projecting moulding (*q.v.*) with a concave profile of single curvature.

CAVIARE or **CAVIAR**, the roe of various species of *Acipenser* or sturgeon prepared, in several qualities, as an article of food. The word is common to most European languages and supposed to be of Turk or Tatar origin, but the Turk word *khavyah* is probably derived from the Ital. *caviala*; the word does not appear in Russian. The best caviare, which can only be made in winter and is difficult to preserve, is the loosely granulated, almost liquid, kind, known in Russia as *ikra*. It is prepared by beating the ovaries and straining through a sieve to clear the eggs of the membranes, fibres and fatty matter; it is then salted with from 4-6% of salt. The difficulty of preparation and of transport has made it a table delicacy in western Europe, where it has been known since the 16th century, as is evidenced by Hamlet's "His play . . . pleased not the million, 'twas caviare to the general."

Caviare is eaten either as an hors d'oeuvre, particularly in Russia and northern Europe, with kummel or other liqueurs, or as a savoury, or as a flavouring to other dishes. The coarser quality, in Russia known as *pajusnaya* (from *pajus*, the adherent skin of the ovaries), is more strongly salted in brine and is pressed into a more solid form than the *ikra*; it is then packed in small barrels or hermetically sealed tins. This forms a staple article of food in Russia and eastern Europe. Though the best forms of caviare are still made in Russia, and the greater quantity of the coarser kinds are exported from Astrakhan, the centre of the trade, larger

amounts are made each year for export in America and also in Germany, Norway and Sweden. The roe of tunny and mullet, pickled in brine and vinegar, is used, under the name of "botargo," along the Mediterranean littoral and in the Levant.

CAVIGLIA, ENRICO (1862—), Italian soldier, was born at Finale Marina (Genoa) on May 4, 1862. After Italy's entry into the World War, he was promoted to major-general and commanded the Bari Brigade. In June 1916 he took over the 29th Division and later was promoted lieutenant-general. In July 1917 he was given command of the XXIV. Corps, which broke through the Austrian lines on the Bainsizza plateau. In June 1918 he was chosen to command the VIII. Army which played an important part in the final victory of Vittorio Veneto. From January to June, 1919, Caviglia was minister of war, and as such became a senator, and in November of the same year he was promoted army general. In Jan. 1920 he took over the command in Venezia Giulia. His task was difficult, since the discipline of the troops had been severely shaken by the example of d'Annunzio's Fiume raid. He restored discipline, and when it became evident that only force would drive d'Annunzio from Fiume, he did not hesitate to carry out his task (Dec. 1920).

CAVITE, a municipality (with administration centre and 11 barrios or districts), and capital of the province of Cavite, Luzon, Philippine Islands, on a forked tongue of land in Manila bay, 8 m. S. of Manila. Pop. (1918) 22,169, of whom 12,108 were males and 340 whites. The harbour is one of the best in the Philippines and for this reason and because of its proximity to Manila, Cavite is the principal naval base and coaling station of the U.S. fleet in Asiatic waters, the coaling docks being located in the northern part of the municipality, called Sangley Point. There are other extensive docks. Here also are located the navy radio station and the arsenal. The municipality is connected with Manila by a railway which follows the contours of Manila bay. The region in the vicinity is of volcanic origin and the soil is very fertile. The chief products are abacá, which is mainly exported to Japan, rice, sugar, copra, cacao, coffee and corn. In 1918 it had five manufacturing establishments with output valued at 103,600 pesos; and 15 schools of which 8 were public. It was an old native town and was early occupied by the Spaniards. The Dutch bombarded it in 1647. Remains of the old fortifications are still to be seen. One of the four penitentiaries established during the Spanish régime was in Cavite. A military insurrection broke out here in 1872. The municipality was almost destroyed by an earthquake in 1880. It was a centre of the revolt directed against Spain in the 19th century and was the scene in 1896 of the execution of 13 political prisoners to whom a monument was erected in 1906. It was captured from the Spanish by Commodore George Dewey in May 1898. In the neighbouring municipality of Cavite Viejo is the home of Gen. Emilio Aguinaldo, leader of the insurrection against the United States. The language spoken is Tagalog.

CAVOUR, CAMILLO BENSO, COUNT (1810-1861), Italian statesman, was born at Turin on Aug. 1, 1810. Being a younger son (his brother Gustavo was the eldest) Cavour was destined for the army, and became an engineer officer. He soon developed strongly marked Liberal tendencies and an uncompromising dislike for absolutism and clericalism, which made him a suspect in the eyes of the police and of the reactionaries. After the accession to the throne of Charles Albert, whom he always distrusted, he resigned his commission (1831). During the next few years he devoted himself to the study of political and social problems, to foreign travel, and to acquiring a thorough knowledge of practical agriculture. Cavour's political ideas were greatly influenced by the July revolution of 1830 in France, which proved that an historic monarchy was not incompatible with Liberal principles, and he became more than ever convinced of the benefits of a constitutional monarchy as opposed both to despotism and to republicanism. He applied his knowledge of agriculture to the management of his father's estate at Leri, which he greatly improved, he founded the Piedmontese Agricultural Society, and took the lead in promoting the introduction of steam navigation, railways and factories into the country. Thus his mind gradually evolved, and he began to dream dreams of a united Italy free of

foreign influence. In 1847 the psychological moment seemed to have arrived, for the new pope, Pius IX., showed Liberal tendencies and seemed ready to lead all the forces of Italian patriotism against the Austrian domination. Cavour, although he realized that a really Liberal pope was an impossibility, saw the importance of the movement and the necessity of profiting by it. He founded a newspaper at Turin called *Il Risorgimento*, which advocated the ideas of constitutional reform. In Jan. 1848 the revolution first broke out in Sicily, and Cavour, in a speech before a delegation of journalists, declared that the king must take a decided line and grant his people a constitution. Charles Albert, after much hesitation, was induced to grant a charter of liberties (Feb. 8, 1848). Cavour continued his journalistic activity, and his articles in the *Risorgimento* came to exercise great influence both on the king and on public opinion. When the news of the revolt of the Milanese against the Austrians reached Turin on March 19, Cavour advocated war against Austria. His article in the *Risorgimento* made such an impression that it put an end to the king's vacillations, and a few days after its appearance war was declared (March 25).

During the war elections were held in Piedmont. Cavour was returned in June, and he took his seat in parliament on the right as a Conservative. He was not a good speaker, but he gradually developed a strong argumentative power, and he rose at times to the highest level of an eloquence which was never rhetorical. After the dissolution in Jan. 1849, Cavour was not re-elected. The new parliament had to discuss, in the first instance, the all-important question of whether the campaign should be continued now that the armistice was about to expire. The king decided on a last desperate throw, and recommenced hostilities. On March 23 the Piedmontese were totally defeated at Novara, a disaster which was followed immediately by the abdication of Charles Albert in favour of his son Victor Emmanuel II. The new king was obliged to conclude peace with Austria and the Italian revolution was crushed, but Cavour did not despair. There were fresh elections in July, and this time Cavour was returned. His speech on March 7, 1850, in which he said that, "Piedmont, gathering to itself all the living forces of Italy, would be soon in a position to lead our mother-country to the high destinies to which she is called," struck the first note of encouragement after the dark days of the preceding year. He supported the ministry of which Massimo d'Azeglio was president in its work of reform and restoration, and in October of the same year, on the death of Santa Rosa, he himself was appointed minister of agriculture, industry and commerce. In 1851 he also assumed the portfolio of finance, and devoted himself to the task of reorganizing the Piedmontese finances. By far the ablest man in the cabinet, he soon came to dominate it, but as a result of a quarrel with d'Azeglio he resigned; he made use of his freedom to visit England and France again, in order to sound public opinion on the Italian question. In London he found the leaders of both parties friendly. At this time Sir James Hudson was appointed British minister at Turin, where he became the intimate friend of Cavour and gave him valuable assistance. In Paris, Cavour had a long interview with Prince Louis Napoleon, then president of the republic, and also met several Italian exiles in France.

On Cavour's return he found a new cabinet crisis, and was invited to form a ministry. By Nov. 4, he was prime minister. He devoted the first years of his premiership to developing the economic resources of the country; but in preparing it for greater destinies, he had to meet the heavy expenditure by increased taxation. Cavour's first international difficulty was with Austria; after the abortive rising at Milan in Feb. 1853, the Austrian Government, in addition to other measures of repression, confiscated the estates of those Lombards who had become naturalized Piedmontese, although they had nothing to do with the outbreak. Cavour took a strong line on this question, and on Austria's refusal to withdraw the obnoxious decree, he recalled the Piedmontese minister from Vienna. Then followed the Crimean War, in which Cavour first showed his extraordinary political insight and diplomatic genius. In spite of many difficulties and opposition from both extreme Conservatives and Radicals, he

negotiated Piedmontese participation in the campaign as a means of bringing the Italian question before the Great Powers. General Dabormida, the minister of foreign affairs, disapproved of this policy and resigned. The vacant portfolio was offered to d'Azeglio, who refused it; whereupon Cavour assumed it himself. On the same day (Jan. 10, 1855) the treaty with France and England was signed, and shortly afterwards 15,000 Piedmontese troops under General La Marmora were despatched to the Crimea.

Events at first seemed to justify the fears of Cavour's opponents. Cholera attacked the Piedmontese soldiers, who for a long time had no occasion to distinguish themselves in action; public opinion became despondent and began to blame Cavour, and even he himself lost heart. Then came the news of the battle of the Tchernaya, fought and won by the Italians, which turned sadness and doubt into jubilation. Joy was felt throughout Italy, especially at Milan, where the victory was the first sign of daylight amid the gloom caused by the return of the Austrians. On the summoning of the Congress of Paris at the conclusion of the war, Cavour represented Piedmont. After much discussion, and in spite of the opposition of Austria, who as mediator occupied a predominant position, Cavour obtained that Piedmont should be treated as one of the Great Powers. By his marvellous diplomatic skill, far superior to that of his colleagues, he first succeeded in isolating Austria, secondly in indirectly compromising Napoleon in the Italian question, and thirdly in getting the wretched conditions of Italy discussed by the representatives of the Great Powers. It was now manifest that the liberation of Italy was personified in him. Cavour's chief measure of internal reform during this period was a bill for suppressing all monastic orders unconnected with education, preaching or charity; this aroused strong opposition and led to the minister's resignation. But he was soon recalled, for the country could not do without him, and the bill was passed (May 29, 1855).

Cavour now saw that war with Austria was merely a question of time, and he began to establish connections with the revolutionaries of all parts of Italy. He continued to strengthen Piedmont's military resources, but he well knew that Piedmont could not defeat Austria single-handed. He would have preferred an alliance with Great Britain, who would never demand territorial compensation; but although British sympathies were with Italy, the British Government was keenly anxious to avoid war. From Napoleon more was to be hoped, for the emperor still preserved some of his revolutionary instincts, while the insecurity of his situation at home made him eager to gain popularity by winning military glory abroad; but he still hesitated, and Cavour devoted the whole of his ability to overcoming his doubts. In spite of the Orsini outrage, an "accidental" meeting between Napoleon and Cavour was arranged and took place at Plombières in July, and although no definite treaty was signed the basis of an agreement was laid, whereby France and Piedmont were to declare war against Austria with the object of expelling her from Italy, and a north Italian State was to be formed; in exchange for this help France was to receive Savoy and possibly Nice. A marriage was to be arranged between Prince Jerome Bonaparte and Princess Clothilde, Victor Emmanuel's daughter. But the emperor still hesitated, and Cavour saw that the only way to overcome the many obstacles in his path was to force Austria's hand. Then there was the danger lest an Italy freed by French arms should be overwhelmed under French predominance; for this reason Cavour was determined to secure the co-operation of volunteers from other parts of Italy, and that the war should be accompanied by a series of risings against Austria and the local despots.

The moment war was seen to be imminent, parties of Italians of all classes, especially Lombards, poured into Piedmont to enlist in the army. Cavour also had a secret interview with Garibaldi, with whom he arranged to organize volunteer corps so that the army should be not merely that of Piedmont, but of all Italy. Every day the situation grew more critical, and on Jan. 10, 1859 the king in his speech from the throne pronounced the memorable words "that he could not remain deaf to the cry of pain (*il grido di dolore*) that reached him from all parts of Italy"—words which, although actually suggested by Napoleon, rang

like a trumpet-call throughout the land. In the meanwhile the marriage negotiations were concluded, and during the emperor's visit to Turin a military convention was signed between the two States, and Savoy and Nice were promised to France as a reward for the expulsion of the Austrians from Italy. But Napoleon, ever hesitating, jumped at the Russian proposal to settle the Italian question by means of his own favourite expedient, a congress. To this Austria agreed on condition that Piedmont should disarm and should be excluded from the congress; England supported the scheme, but desired that all the Italian States should be represented. Cavour was in despair at the turn events were taking but decided at last reluctantly to accept the proposal, lest Piedmont should be abandoned by all, while he clung to the hope that Austria would reject it. On April 19, the Austrian emperor, on the advice of the military party, did reject it; and on the 23rd, to Cavour's inexpressible joy, Austria sent an ultimatum demanding the disarmament of Piedmont. Cavour replied that his Government had agreed to the congress proposed by the Powers and that it had nothing more to say. On quitting the chamber that day he said to a friend: "I am leaving the last sitting of the last Piedmontese parliament"—the next would represent united Italy. France now allied herself definitely with Piedmont, and England, delighted at Cavour's acquiescence became wholly friendly to the Italian cause. A few days later Austria declared war.

As La Marmora now took the chief command of the army Cavour added the ministry of war to the others he already held. His activity at this time was astounding, for he was virtually dictator and controlled single-handed nearly all the chief offices of the State. The French and Piedmontese forces defeated the Austrians in several battles, and the people rose in arms at Parma, Modena, Florence and Bologna; the local princes were expelled and provisional governments set up. Cavour sent special commissioners to take charge of the various provinces in Victor Emmanuel's name. But these events, together with Prussia's menacing attitude, began to alarm Napoleon, who, after Solferino, concluded an armistice with Austria at Villafranca on July 8, without previously informing Cavour. When Cavour heard of it he was thunderstruck; he immediately interviewed the king at Monzambano, and in violent, almost disrespectful language implored him not to make peace until Venice was free. But Victor Emmanuel saw that nothing was to be gained by a refusal, and much against his own inclination, signed the peace preliminaries at Villafranca, adding the phrase, "pour ce qui me concerne," which meant that he was not responsible for what the people of other parts of Italy might do (July 12). Lombardy was to be ceded to Piedmont, Venetia to remain Austrian, the deposed princes to be reinstated, and the pope made president of an Italian confederation.

The cabinet resigned the next day, and Cavour privately advised the revolutionists of central Italy to resist the return of the princes, by force if necessary. Palmerston, who had meanwhile succeeded Malmesbury as foreign minister, informed France and Austria that Great Britain would never tolerate their armed intervention in favour of the central Italian despots. On Nov. 10, peace was signed at Zürich, and on the fall of the Rattazzi-La Marmora cabinet the king, in spite of the quarrel at Monzambano, asked Cavour to take office again. Napoleon still refused to consent to the union of Tuscany with Piedmont, and Cavour saw that Napoleon might be ready to deal; although the bargain of the preceding year had not been exactly fulfilled, as the Austrians were still in Venice, he again brought forward the question of Nice and Savoy. On March 24, the treaty was signed, and the emperor's opposition to the annexation of central Italy withdrawn. On April 2, the parliament representing Piedmont, the duchies of Parma and Modena, Tuscany and Romagna, met, and Cavour had the difficult and ungrateful task of explaining the cession of Nice and Savoy. In spite of some opposition, the agreement was ratified by a large majority.

The situation in the kingdom of Naples was now becoming critical, and Cavour had to follow a somewhat double-faced policy, on the one hand negotiating with the Bourbon king (Francis II.), suggesting a division of Italy between him and Victor Emmanuel, and on the other secretly backing up the revolutionary

agitation. Having now learnt that Garibaldi was planning an expedition to Sicily with his volunteers, he decided not to oppose its departure; on May 5, it sailed from Quarto near Genoa. Garibaldi with his immortal Thousand landed at Marsala, and the whole rotten fabric of the Bourbon Government collapsed. He crossed over to the mainland, and entered Naples in triumph. But Cavour feared, that, although Garibaldi himself had always loyally acted in the king of Italy's name, the republicans around him might lead him to commit some imprudence and plunge the country into anarchy, and that Garibaldi might invade the papal States, which would have led to further international complications. But the pope had made considerable armaments; his forces, consisting largely of brigands and foreigners under the French general Lamoricière, maintained a menacing attitude on the frontier; Cavour decided on the momentous step of annexing the papal States with the exception of the Roman province. The Italian forces crossed the frontier from Romagna on Sept. 11, and were everywhere received with open arms by the people; Ancona was taken, Lamoricière was defeated and captured at the battle of Castelfidardo, and on the 20th King Victor marched into the Neapolitan kingdom. On Oct. 1, Garibaldi defeated the Neapolitan troops on the Volturno, and Gaeta alone, where King Francis of Naples had retired, still held out.

Cavour had to use all his tact to restrain Garibaldi from marching on Rome and at the same time not to appear ungrateful. He refused to act despotically, and summoned parliament to vote on the annexation, which it did on the 11th. Two days later Garibaldi magnanimously gave in to the nation's will and handed his conquests over to King Victor as a free gift. Gaeta surrendered on Feb. 13, and King Francis retired to Rome. Parliament was dissolved once more; the new chamber showed an overwhelming majority in favour of Cavour, and Victor Emmanuel was proclaimed king of Italy.

The last question with which Cavour had to deal was that of Rome. In October he declared in parliament that Rome must be the capital of Italy, for no other city was recognized as such by the whole country, and in Jan. 1861 a resolution to that effect was passed. But owing to Napoleon's attitude he had to proceed warily, and made no attempt for the present to carry out the nation's wishes. At the same time he was anxious that the Church should preserve the fullest liberty, and he believed in the principle of "a free Church in a free State." The long strain of these last years had been almost unbearable, and at last began to tell; the negotiations with Garibaldi were particularly trying, for while the great statesman wished to treat the hero and his volunteers generously, he could not permit all the Garibaldian officers to be received into the regular army with the same ranks they held in the volunteer forces. This question, together with that of Nice, led to a painful scene in the chamber between the two men, although they were formally reconciled a few days later. For some time past Cavour had been unwell and irritable, and the scene with Garibaldi undoubtedly hastened his end. A fever set in, and after a short illness he passed away on June 6, 1861. He was buried on his ancestral estate of Santena.

The death of Cavour was a terrible loss to Italy; there remained many problems to be solved in which his genius and personality were urgently needed. But the great work had been carried to such a point that lesser men might now complete the structure. He is undoubtedly the greatest figure of the *Risorgimento*, and although other men and other forces co-operated in the movement, it was Cavour who organized it and skilfully conducted the negotiations necessary to overcome all, apparently insuperable, obstacles. (L. V.)

CAVOUR (anc. *Caburrum* or *Forum Vibii*), a village of Piedmont, Italy, in the province of Turin, 32m. S.W. by rail and steam tram (via Pinerolo) from the town of Turin. Pop. 1,508 (town); 6,259 (commune). It lies on the north side of a huge isolated mass of granite (the Rocca di Cavour) which rises from the plain. On the summit was the Roman village. The town gave its name to the Benso family of Chieri, who were raised to the marquise in 1771, and of which the statesman Cavour was a member.

CAVY, the name of several South American rodents of the family *Caviidae* (see *RODENTIA*); originally it was confined to the domesticated guinea-pig and its allies of the genus *Cavia*. (The word "guinea" here may be a corruption of "Guiana" but more probably it means "foreign".) The true cavies are small, self-coloured animals, with short, rounded ears and no tail. They are partly diurnal and live in burrows. The diet is vegetarian and their cries are faint squeaks and grunts. Unlike the prolific guinea-pig, which begins to breed at two months old and may be the parent stock of a thousand individuals in a year, the wild cavies breed only once a year, producing one or two young at a time. These are born in a very advanced stage of development and are able to feed themselves the following day.

Cavies are widely distributed in South America. The original of the domestic race is *C. cutleri* of Peru. *C. boliviensis* is found at great elevations in the Andes. The restless cavy of Brazil is *C. porcellus*. The Patagonian cavy or mana (*Dolichotis patagonica*) resembles a hare in shape and habits, but lives in a burrow. Fossil species of this genus, of which there is a second smaller type in Argentina, have been found in Brazil and the Argentine.

CAWDOR, village and parish, Nairnshire, Scotland. Pop. of parish (1931) 767. The village is situated 5 m. S.S.W. of Nairn and 3 m. from Gollanfield Junction on the L.M.S.R. The castle was the scene, according to the tradition which Shakespeare has perpetuated, of the murder of King Duncan by Macbeth, thane of Cawdor (or Calder), in 1040. Since the oldest part of the structure dates from 1454, however, and seemingly had no predecessor, the tradition has no foundation in fact. The building stands on the rocky bank of Cawdor burn, a right-bank tributary of the Nairn. The massive keep with small turrets is the original portion of the castle, and to it were added, in the 17th century, the modern buildings forming two sides of a square. Kilravock (pronounced *Kilrawk*) castle, 1½ m. W. of Cawdor, commands the left bank of the Nairn. Its keep dates from 1460, and the later buildings belong to the 17th century. It has been continuously tenanted by the Roses, who came over with William the Conqueror and settled at Kilravock in 1293, since which date son has succeeded father in direct descent. Queen Mary was received at the castle in 1562, and Prince Charles Edward was entertained four days before the battle of Culloden. The gardens are beautiful.

CAWNPORE, a city and district of British India in the Allahabad division of the United Provinces. The city is situated on the south bank of the Ganges, 40 m. south-west of Lucknow, and formed from early times a frontier outpost of the people of Oudh and Bengal against their northern neighbours. Clive selected it, on account of its commanding position, as the cantonment for the brigade of troops lent him by the nawab of Oudh. In 1801, when the Ceded Provinces were acquired by the East India Company, it became the chief British frontier station, but by the time of the Mutiny the frontier had left it behind, and it was denuded of troops. It is now again a military station of some importance, and a very large railway centre. But its industrial development has been unique in northern India. Starting with a government harness factory, the manufacture of leather goods in every form has attained the position of a first-class industry. There are also large cotton-mills, a woollen manufactory with a

world-wide reputation and a number of engineering and other minor industries. Extensive city improvements have been launched in order to keep pace with the sanitary requirements of the growing labour force. On the outskirts of the city is a fine agricultural college and demonstration farm. The population of the city and cantonment in 1921 was 216,436.

The name of Cawnpore is indelibly connected with the blackest episode in the history of the Indian Mutiny—the massacre here in July 1857 of hundreds of women and children by the Nana Sahib. The entrenchment, where General Sir H. M. Wheeler with his small band of soldiers and the European and Eurasian residents were exposed for 21 days to the fire of the mutineers, is merely a bare field. About three-quarters of a mile away, on the banks of the river Ganges, is the Massacre Ghat. A grassy road between banks 10 to 12 ft. high leads down to the river, and it was among the trees on these banks that the murderers concealed themselves and shot down the little garrison as soon as they were embarked in the boats which were to take them to safety. On the Ghat itself, or temple steps down to the water, some 600 helpless people were slain, in spite of a promise of safe conduct from the Nana. The remaining 200 victims, who had escaped the bullets of the siege and survived the butchery of the river bank, were massacred afterwards and cast down the famous well of Cawnpore, which is now marked by a memorial and surrounded by gardens. The memorial is crowned by the figure of an angel in white marble, and on the wall of the well itself is the following inscription:

Sacred to the perpetual Memory of a great company of Christian people, chiefly Women and Children, who near this spot were cruelly murdered by the followers of the rebel Nana Dhundu Pant, of Bithur, and cast, the dying with the dead, into the well below, on the xvth day of July, MDCCCLVII.

The DISTRICT OF CAWNPORE is situated between the Ganges and Jumna rivers, and is a portion of the well-watered and fertile tract known as the Doab, the total area being 2,368 sq.m. The general inclination of the country is from north to south. Besides the two great rivers, the principal streams are the Arand or Rhind, the Kavan or Singar, the Isan and the Pandu. The district is watered by four branches of the Ganges canal. The population in 1921 was 1,148,664.

CAXTON, WILLIAM (c. 1422-1491), the first English printer, was born somewhere in the Weald of Kent. The name, which was apparently pronounced Caxton, is identical with Causton, the name of a manor in the parish of Hadlow. The date of Caxton's birth was arbitrarily fixed in 1748 by Oldys as 1412. Blades, however, inferred that in 1438, when he was apprenticed to Robert Large, he would not have been more than 16 years of age. Robert Large was a rich silk mercer who became lord mayor of London in 1439, and the fact of Caxton's apprenticeship to him argues that Caxton's own parents were in a good position. When Large died in 1441, Caxton was probably sent direct to Bruges, then the central foreign market of the Anglo-Flemish trade, for he presently entered business there on his own account. In 1450 his name appears in the Bruges records as standing joint surety for the sum of £100; and in 1463 he was acting governor of the company of Merchant Adventurers in the Low Countries. This association, sometimes known as the "English Nation," was dominated by the Mercers' Company, to the livery of which Caxton had been formally admitted in London in 1453. In 1464 he was appointed to negotiate with Philip, duke of Burgundy, the renewal of a treaty concerning the wool trade, which was about to expire. These attempts failed, but he was again employed in a similar but successful mission in Oct. 1468 to the new duke, Charles the Bold, who had just married Princess Margaret of York, sister of Edward IV. The last mention of Caxton in the capacity of governor of the "English Nation" is on Aug. 13, 1469, and it was probably about that time that he entered the household of the duchess Margaret, possibly in the position of commercial adviser.

He had already begun his translation of the popular mediaeval romance of Troy, *The Recuyell of the Historyes of Troye*, from the French of Raoul le Fèvre; and, after laying it aside for some time, he resumed it at the wish of the duchess Margaret, to whom the ms. was presented. From July 1471 until after Midsummer 1472 Caxton was in Cologne, and it was there, as his disciple

Wynkyn de Worde tells us, that he learned the art of printing. On his return to Bruges, he set up a press, in partnership with Colard Mansion, and there his *Recuyell* was printed in 1474 or 1475. His second book, *The Game and Playe of Chesse*, from the *Liber de ludo scacchorum* of Jacobus de Cessolis through the French of Jehan de Vignay, was finished in 1474, and printed in 1476; the last book printed by Mansion and Caxton at Bruges was the *Quatre derrenieres choses*, an anonymous treatise usually known as *De quattuor novissimis*.

Then Caxton returned to England and established himself, at Michaelmas, 1476, in the almonry at Westminster at the sign of the Red Pale. The first known piece of printing issued from the Caxton press in England is an *Indulgence* printed by Caxton and issued by Abbot Sant on Dec. 13, 1476, which was discovered in the Record Office in 1928 by Mr. S. C. Ratcliffe. The first dated book printed in England was Lord Rivers' translation (revised by Caxton) of *The Dictes or sayenges of the phylosophers* (1477) (see BLACK LETTER). The date, Nov. 18, 1477, is given in the colophon to the copy in the John Rylands Library, Manchester, the only one which possesses the colophon. From this time until his death Caxton was busy writing and printing. His services to English literature, apart from his work as a printer (see TYPOGRAPHY), are very considerable. His most important original work is an eighth book added to the *Polychronicon* (vol. viii. in the Rolls Series edition) of Ralph Higden. Caxton revised and printed John of Trevisa's work, and brought down the narrative himself from 1358 to 1460, using as his authorities *Fasciculus temporum*, a popular work in the 15th century, and an unknown *Aureus de universo*. He printed Chaucer's *Canterbury Tales* (1478? and 1483), *Troilus and Creseide* (1483?), the *House of Fame* (1483?), and the translation of Boethius (1478?); Gower's *Confessio Amantis* (1483), and many poems of Lydgate. His press

BY COURTESY OF THE JOHN RYLANDS LIBRARY, MANCHESTER
 COLOPHON TO CAXTON'S "DICTES AND SAYENGES OF THE PHYLOS-
 OPHERS" (1477), THE FIRST BOOK PRINTED IN ENGLAND TO BEAR A
 DATE
 The colophon, an inscription placed at the end of a book in early times,
 contained information now usually found on the title page

was, however, not worked for purely literary ends, but was a commercial speculation. For the many service-books which he printed there was no doubt a sure sale, and he met the taste of the upper classes by the tales of chivalry which issued regularly from his press. He printed Malory's *Morte d'Arthur*, and himself translated from the French the *Boke of Histories of Jason* (1477?), *The Historie of Reynart the Foxe* (from the Dutch, 1481 and 1489?), *Godfrey of Boloyne* or *The Siege and Conqueste of Jherusalem* (1481), *The Lyf of Charles the Grete* (1485), *The Knyght Parys and the Fayr Vyenne* (1485), *Blanchardyn and*

Eglantine (1489?), *The Foure Sonnes of Aymon* (1489?); also the *Morale Proverbs* (1478), and the *Fayttes of Armes and of Chyualrye* (1489) of Christine de Pisan. The most ambitious production of his press was perhaps his version of the *Golden Legend*, the translation of which he finished in Nov. 1483. It is based on the lives of the saints as given in the 13th century *Legenda aurea* of Jacobus de Voragine, but Caxton chiefly used existing French and English versions for his compilation. The book is illustrated by 70 woodcuts, and Caxton says he was only encouraged to persevere in his laborious and expensive task by the liberality of William, earl of Arundel. The idleness which he so often deprecates in his prefaces was no vice of his, for in addition to his voluminous translations his output as a printer was over 18,000 pages, and he published 96 separate works or editions of works, with apparently little skilled assistance.

The different founts of type used by Caxton are illustrated by Blades and Duff, and there is an excellent selection of Caxtons in the British Museum and in the University library at Cambridge. His books have no title-pages, and from 1487 onwards are usually adorned with a curious device, consisting of the letters W.C. separated by a trade mark, with an elaborate border above and below. The flourishes on the trade mark have been fancifully interpreted as S.C. for Sancta Colonia, implying that Caxton learnt his art at Cologne, and the whole mark has been read as 74, for 1474, the date of his first printed book. This device was subsequently adopted with small alterations by his successor at the Westminster press, Wynkyn de Worde. The first of his books containing woodcut illustrations was his *Myrrour of the World* (1481), translated from Vincent de Beauvais, but he had used a woodcut initial letter in his broadside *Indulgence* printed in 1476.

No record of Caxton's marriage or of the birth of his children has been found, but Gerard Croppe was separated from his wife Elizabeth, daughter of William Caxton, before 1496, when Croppe made certain claims in connection with his father-in-law's will.

BIBLIOGRAPHY.—Earlier biographies of Caxton were superseded by the work of William Blades, whose *Life and Typography of William Caxton* (1861-63) remains the standard authority. It contains a bibliography of each of the works issued from Caxton's press. For later discoveries see E. Gordon Duff, *William Caxton* (1905) and H. R. Plomer, *William Caxton* (1925). Many of Caxton's translations are available in modern reprints.

CAYAPAS, a tribe of South American Indians, belonging to the Barbacoan (g.v.) linguistic stock or sub-stock. Their habitat is the lower Cayapa river and adjacent coasts in northern Ecuador. Traditionally they formerly lived in the upland region about Quito, moving to the coast a short time before the first appearance of Europeans. They have now become much mixed with negroes, and relatively little of their original culture survives.

See S. A. Barrett, "The Cayapa Indians of Ecuador" (Museum of the American Indian, *Indian Notes and Monographs*, No. 40. New York, 1925).

CAYENNE, a seaport and the capital of French Guiana, on the north-west extremity of the island of Cayenne, and near the mouth of the river of that name. Pop. 10,146. The town forms an almost perfect square, and has clean and well-macadamized streets. In the old town, the streets are not so regularly and well built as in the new. The Place d'Armes, a fine quadrangular space, lies between them. To the right of the governor's house is Mt. Cépéron, on which stand Ft. St. Michel, the marine barracks, the signal station and the lighthouse. Here, too, are the capacious reservoirs for the water-supply of the town, the source of which is a lake to the south of the island. The harbour is shallow at its entrance, and craft drawing more than 14 ft. are obliged to anchor 6 m. from the town. There is no dock for the repair of vessels; but there are two quays at the town. The principal exports of Cayenne are gold, cocoa, phosphates, hides, woods and spices. The imports are French wines, spirits and liqueurs; silk and cotton stuffs, tobacco, hardware, glass, earthenware, clothing, preserved meat, fish, and vegetables, maize, flour, hay, bran, oils and cattle. There is a regular mail service between Cayenne and Martinique once a month. Cayenne is the seat of the government of French Guiana, and was formerly a penal settlement for political offenders. The temperature of Cayenne is between 76° and 88° F throughout the

year; but the heat is tempered by easterly winds. Between December and March a north wind blows. Fevers often attack the inhabitants; but the climate, though moist, is on the whole healthy. (See *GUIANA*.)

CAYENNE PEPPER (*Guinea Pepper, Spanish Pepper, Chilly*), a preparation from the dried fruit of various species of *Capsicum*, a genus of the family Solanaceae. The true peppers are members of a totally distinct family Piperaceae. The fruits of *Capsicum* have all a strong, pungent flavour. The capsicums bear a greenish-white flower, with a star-shaped corolla and five anthers standing up in the centre of the flower like a tube, through which projects the slender style. The podlike fruit consists of an envelope at first fleshy and afterwards leathery, within which are the spongy pulp and several seeds. The plants are herbaceous or shrubby; the leaves are entire, and alternate, or in pairs near one another; the flowers are solitary and do not arise in the leaf-axils. There are about 30 species, natives of Central and South America. They are now grown in various parts of the world, both for the fruit and for ornament. The principal source of cayenne pepper is *C. annum*, the spur or goat pepper, a dwarf shrub, a native of South America, but commonly cultivated in the East Indies. It produces a small, narrow, bright red pod, having very pungent properties. *Chillies*, the dried fruit of capsicums, are used to make chilly-vinegar, as well as for pickles. Cayenne pepper is manufactured from the ripe fruits, which are dried, ground, mixed with wheat flour, and made into cakes with yeast; the cakes are baked till hard like biscuit; and then ground and sifted. The pepper is sometimes prepared by simply drying the pods and pounding them fine in a mortar. Chillies have been in use from time immemorial; they are eaten in great quantity by the people of Guiana and other warm countries, and in Europe are consumed both as a spice and as medicine.

CAYEY, an interior town of Porto Rico. Pop. (1930), 5,953. The population of the municipal district in 1930 was 28,797. The altitude is 1,400 ft. and the average temperature about 71° F. Cayey, one of the healthiest and most beautifully located towns of the island, is on the famous military highway built by Spain diagonally across the island from San Juan on the Atlantic ocean to Ponce on the Caribbean sea. One of the branches of this highway extends to Guayama and another to Salinas, both on the Caribbean. On account of its healthy climate the Spanish rulers established a military post here; the Americans succeeding them used it as a United States army post, and it is now a sub-post of the 65th Regiment of the regular army. The United States naval communication service has a high-power station at Cayey (also available for the use of other branches of the Federal Government) for direct communication with Washington and with Balboa in the Canal Zone. The town is well built, with waterworks, electric light, hospitals and schools. It is the centre of a region where tobacco and coffee of superior quality are produced, and has many warehouses and factories.

CAYLEY, ARTHUR (1821-1895), English mathematician, was born at Richmond, Surrey, on Aug. 16, 1821. He entered Trinity college, Cambridge, as a pensioner, became a scholar in May 1840, senior wrangler, first Smith's prizeman and fellow of Trinity in 1842, and a major fellow in 1845. In 1846, he entered at Lincoln's Inn, and became a pupil of the conveyancer Mr. Christie. He was called to the bar in 1849, and remained at the bar till he was elected to the new Sadlerian chair of pure mathematics at Cambridge in 1863, when he married Susan, daughter of Robert Moline of Greenwich. He held this chair till his death, on Jan. 26, 1895. His 800 mathematical papers, published in 13 large quarto volumes by the Cambridge University Press, treat of nearly every subject of pure mathematics, and also of theoretical dynamics and spherical and physical astronomy. He was as much a geometrician as an analyst. We may especially mention his ten memoirs on quantics (1854-1878), his creation of the theory of matrices, his researches on the theory of groups, his memoir on abstract geometry, a subject which he created, his introduction to geometry of the "absolute," his researches on the higher singularities of curves and surfaces, the classification of cubic curves, additions to the theories of rational transformation

and correspondence, the theory of the twenty-seven lines that lie on a cubic surface, the theory of elliptic functions, the attraction of ellipsoids, and the British Association reports, 1857 and 1862, on recent progress in general and special theoretical dynamics, and on the secular acceleration of the moon's mean motion. Competent judges have compared him to Leonhard Euler for his range, analytical power and introduction of new and fertile theories. He was the recipient of nearly every academic distinction that can be conferred upon an eminent man of science. His nature was noble and generous, and the universal appreciation of this fact gave him great influence in his university. His portrait, by Lowes Dickinson, was placed in the hall of Trinity college in 1874, and his bust, by Henry Wiles, in the library of the same college in 1888.

CAYLUS, ANNE CLAUDE, COMTE DE, Marquis d'Ester-nay, baron de Bransac (1692-1765), French archaeologist and man of letters, was born in Paris. His mother, the comtesse de Caylus (1673-1729), was a cousin of Mme. de Maintenon, who brought her up like her own daughter. She wrote valuable memoirs of the court of Louis XIV. entitled *Souvenirs*; these were edited by Voltaire (1770) and by many later editors, notably by Ch. Asselineau (1860). Caylus was on active service with the French army from 1709-14. After the Peace of Rastadt he travelled in Italy, Greece, the East, England and Germany. He became an active member of the Academy of Painting and Sculpture and of the Academy of Inscriptions. Among his works are *Recueil d'antiquités égyptiennes, étrusques, grecques, romaines et gauloises* (6 vols. 1752-55), *Numismata Aurea Imperatorum Romanorum*, and a *Mémoire* (1755) on the method of encaustic painting with wax mentioned by Pliny, which he claimed to have rediscovered. Caylus was himself an admirable engraver; he also caused engravings to be made of Bartoli's copies from ancient pictures. He encouraged young artists, but his patronage was somewhat capricious. Diderot expressed this fact in an epigram in his *Salon* of 1765: "La mort nous a délivrés du plus cruel des amateurs." The Comte de Caylus had quite another side to his character. He had a thorough acquaintance with the gayest and most disreputable sides of Parisian life, and left a number of more or less witty stories dealing with it. These were collected (Amsterdam, 1787) as his *Oeuvres badines complètes*. The best of them is the *Histoire de M. Guillaume, cocher* (c. 1730).

The *Souvenirs du comte de Caylus*, published in 1805, is of very doubtful authenticity. See also A. and J. de Goncourt, *Portraits intimes du XVIII^e siècle*; Ch. Nisard's edition of the *Correspondance du comte de Caylus avec le père Paciaudi* (1877); and Rocheblave, *Le Comte de Caylus* (1890).

CAYMAN, the name applied loosely to various alligators (*q.v.*), especially in South America. The word is also used generically, some systematists separating two species of alligator as caymans.

CAYMAN ISLANDS, three low-lying islands in the West Indies, Grand Cayman, Little Cayman and Cayman Brac, are situated between 79° 44' and 80° 26' W. and 19° 44' and 19° 46' N., forming a dependency of Jamaica, which lies 178 m. E.S.E. Grand Cayman, a flat rock-bound island protected by coral reefs, is 17 m. long, and varies from 4 m. to 7 m. in breadth. It has two towns, Georgetown and Boddentown. Little Cayman and Cayman Brac are both about 70 m. E.N.E. of Grand Cayman. The soil is shallow but not infertile. Some small mahogany and other timber and dye-woods are grown. Large quantities of coconuts are produced in the two smaller islands. Phosphate deposits are worked, but the most lucrative occupation is catching turtles for export to Jamaica. The white people are of fine physique, are excellent shipwrights, and do a trade in schooners built locally. The Government is administered by a commissioner, and the laws passed by the local legislature are subject to the assent of the governor of Jamaica. Population about 5,365. The islands were discovered by Columbus, who named them Tortugas, from the turtles with which the surrounding seas abound. They were never occupied by the Spaniards and were colonized from Jamaica by the British.

CAYUGA AND SENECA CANAL: see NEW YORK STATE BARGE CANAL SYSTEM.

CAYUVAVAN, a linguistic stock of South American Indians comprising but a single tribe. The validity of this stock is doubtful. The Cayuvavas formerly lived in northern Bolivia on and west of the Mamore river for some 60m. above its confluence with the Guaporé. The surviving remnants are now mainly settled at the mission of Exaltacion de Santa Cruz. The Indians of this group were sedentary agriculturists, and known as the best canoe-men of the region. They appear to have retained little of their old culture and, like many of the tribes of this area, are very little known.

See A. D'Orbigny, *L'Homme Américain* (Paris, 1839).

CAZALÈS, JACQUES ANTOINE MARIE DE (1758–1805), French orator and politician, was born at Grenade in Languedoc, of a family of the lower nobility. Before 1789 he was a cavalry officer, but in that year was returned as deputy to the states general. In the Constituent Assembly he belonged to the section of moderate royalists who sought to set up a constitution on the English model, and his speeches in favour of retaining the right of war and peace in the king's hands and on the organization of the judiciary gained the applause even of his opponents. After the insurrection of Aug. 10, 1792, which led to the downfall of royalty, Cazalès emigrated. He fought in the army of the *émigrés* against revolutionary France, lived in Switzerland and in England, and did not return to France until 1803. He died on Nov. 24, 1805. His son, Edmond de Cazalès, wrote philosophical and religious studies.

See *Discours de Cazalès*, ed. by Chare (1821), with an introduction; F. A. Aulard, *Les Orateurs de la Constituante* (2nd ed., 1905).

CAZALIS, HENRI (1840–1909), French poet and man of letters, was born at Corneilles-en-Parisis (Seine-et-Oise). He wrote under the pseudonyms of Jean Caselli and Jean Lahor. His oriental habits of thought earned for him the title of the "Hindou du Parnasse contemporain."

His works include: *Chants populaires de l'Italie* (1865); *Vita tristis, Réveries fantastiques, Romances sans musique* (1865); *Le Livre du néant* (1872); *Henry Regnault, sa vie et son oeuvre* (1872); *L'Illusion* (1875–93); *Melancholia* (1878); *Cantique des cantiques* (1885); *Les Quatrains d'Al-Gazali* (1896); *William Morris* (1897). See a notice by P. Bourget in *Anthologie des poètes fr. du XIX.^e siècle* (1887–88); J. Lemaître, *Les Contemporains* (1889); E. Faguet in the *Revue bleue* (Oct. 1893).

CAZEMBE, the hereditary name of an African chief, whose territory was situated south of Lake Mweru and north of Bangweulu, between 9° and 11° S. In the end of the 18th century the authority of the Cazembe was widely recognized. The kingdom, known also as the Cazembe, diminished in power and extent, until the last quarter of the 19th century, when the Cazembe sank to the rank of a petty chief. The country is now divided between Great Britain and Belgian Congo. The British half, east of the Luapula, forms part of Rhodesia, and its chief town is Kazembe, 9° 49' S., 28° 52' E. The native state, ruled by negroes, who overcame the aboriginals, had attained a certain degree of civilization. Agriculture was diligently followed, and cotton cloth, earthenware and iron goods manufactured. The country contains rich deposits of copper, and copper ore was one of the principal articles of export. On his accession every new Cazembe chose a new site for his residence. In 1796 the Cazembe was visited by Manoel Caetano Pereira, a Portuguese merchant. Between that date and 1831 it was visited several times by Portuguese, one of whom, Dr. Francesco José Maria de Lacerda, left behind him a valuable journal. In 1868 David Livingstone visited the Cazembe, whose capital at that time numbered no more than 1,000 souls. Since 1894, when the country was divided between Britain and the Congo State, it has been thoroughly explored. An important copper mining industry is carried on in the Congo division of the territory.

See *The Lands of the Cazembe*, published by the Royal Geographical Society in 1873, containing translations of Lacerda and Baptista's journals, and a résumé of Gamitto's *O Muata Cazembe* (Lisbon, 1854); also Livingstone's *Last Journals* (London, 1874).

CAZIN, JEAN CHARLES (1840–1901), French landscape-painter, son of a well-known doctor, F. J. Cazin (1788–1864), was born at Samer, Pas-de-Calais. After studying in

France, he went to England and was strongly influenced by the pre-Raphaelite movement. His chief earlier pictures have a religious interest; such are "The Flight into Egypt" (1877) and "Hagar and Ishmael" (1880, Luxembourg). Later, his combination of luminous landscape with figure-subjects ("Souvenir de fête," 1881; "Journée faite," 1888) gave him a wide reputation and made him the leader of a new school of idealistic subject-painting in France. His wife, Marie Cazin, who was his pupil, was also a well-known artist and sculptor.

CAZOTTE, JACQUES (1719–1792), French author, was born at Dijon. He was educated by the Jesuits, and at 27 obtained a public office at Martinique, returning to Paris in 1760 with the rank of commissioner-general. The most famous of his works is the *Diable amoureux* (1772), a tale with a Spanish setting in which the hero raises the devil. About 1775 Cazotte embraced the views of the Illuminati, declaring himself possessed of the power of prophecy. It was upon this fact that La Harpe based his famous *jeu d'esprit*, in which he represents Cazotte as prophesying the most minute events of the Revolution. On the discovery of some fantastic letters in Aug. 1792, Cazotte was arrested; and though he escaped for a time through the heroism of his daughter he was executed on Sept. 25.

Other works by Cazotte are *Les Mille et une jadaïses* (1742; Eng. trans. 1927); and a prose epic *Olivier* (1762). The only complete edition is the *Oeuvres badines et morales, historiques et philosophiques de Jacques Cazotte* (1816–17), though more than one collection appeared during his lifetime. An édition de luxe of the *Diable amoureux* was edited (1878) by A. J. Pons, and a selection of Cazotte's *Contes*, edited (1880) by Octave Uzanne, is included in the series of *Petits Conteurs du XVIII^e siècle*. The best notice of Cazotte is in the *Illuminés* (1852) of Gérard de Nerval.

CAZUNGO: see ANGOLA.

"C" BATTERY is an electric battery, used in radio circuits. It is connected between the cathode or negative electrode and the grid of a vacuum tube and supplies a direct voltage to the grid.

C.C.C. HIGHWAY, known as the "Three Cs" highway, extends from Cleveland on the Great Lakes, through Columbus, the capital of Ohio, to Cincinnati on the Ohio river. It is about 260 m. long and passes through the heart of the State. Medina, Wooster, Mt. Vernon and Washington Court House lie in its path.

CEANOTHUS, in botany, a genus of North American shrubs or trees of the buckthorn family (Rhamnaceae), comprising more than 50 species found chiefly in the Pacific coast region, 30 of

which are native to California. The small but showy white or blue flowers are usually borne in dense panicles or umbels. Several species and various hybrids are grown as garden plants. Only two species occur east of the Rocky Mountains, the New Jersey tea or great red-root (*C. americanus*) and the lesser red-root (*C. ovatus*), both widely distributed. The genus attains its maximum development in the foothills and mountains of California, often constituting a considerable part of the shrubs of the chaparral belt. Noteworthy representatives are the California lilac and the Oregon tea-tree (*q.q.v.*).

CEARÁ, a northern maritime State of Brazil, bounded north by the Atlantic, east by the Atlantic and the States of Rio Grande do Norte and Parahyba, south by Pernambuco, and west by Piahy, and having an area of 57,356 sq. miles. It lies partly upon the north-east slope of the great Brazilian plateau, and partly upon the sandy coastal plain. Its surface is a succession of great terraces, facing north and north-east, formed by the denudation of the ancient sandstone plateau which once covered this part of the continent; the terraces are seamed by watercourses, and their valleys broken by hills and ranges of highlands, usually described as mountain ranges, but in fact only the remains

of the ancient plateau, capped with horizontal strata of sandstone, and having a remarkably uniform altitude of 2,000 to 2,400ft. The flat top of such a range is called a *chapada* or *taboleira*, and its width in places is from 32 to 56 miles.

The boundary line with Piahy follows one of these ranges, the Serra de Ibiapaba, which unites with another range on the southern boundary of the State, known as the Serra do Araripe. Another range, or escarpment, crosses the State from east to west, but is broken into two principal divisions, each having several local names. These ranges are not continuous, the breaking down of the ancient plateau having been irregular and uneven. The higher ranges intercept considerable moisture from the south-east trade winds, and their flanks and valleys are covered with forest, but the plateaus are either thinly wooded or open campo. These upland forests are of a scrubby character and are called *catingas*.

The sandy, coastal plain, with a width of 12 to 18m., is nearly bare of vegetation; behind there is a more elevated region with broken surfaces and sandy soil which is amenable to cultivation and produces fruit and most tropical products when conditions are favourable. The rivers of the State are small and, with one or two exceptions, become completely dry in the dry season. The largest is the Jaguaribe, which flows entirely across the State in a north-east direction with an estimated length of 210 to 465 miles. The year is divided into a rainy and dry season, the rains beginning in January to March and lasting until June. The soil of the interior is thin and porous and does not retain moisture; consequently the long, dry season turns this part of the country into a barren waste, relieved only by vegetation along the river courses and mountain ranges, and by the hardy, widely distributed carna-huba palm (*Copernicia cerifera*), which in places forms groves of considerable extent. Sometimes the rains fail altogether, and then a drought (*sêcca*) ensues, causing famine and pestilence throughout the entire region. The most destructive droughts recorded are those of 1711, 1723, 1777-78, 1790, 1825, 1844-45 and 1877-78, the last-mentioned destroying nearly all the live-stock in the State, and causing the death through starvation and pestilence of nearly half a million people—more than half the population—while thousands more were obliged to migrate to other states.

There are two lines of railway running inland from the coast: the Baturité line from Fortaleza to Cedro, 475 miles, and the Sobral line from Camocim (a small port) to Grathaus, about 210 miles. The railways were built by the national government after the drought of 1877-78 to give work to the starving refugees, and are now operated under leases. Great dams are also being constructed and extensive irrigation systems laid out.

Only a very small percentage of the population which numbered 1,319,228 in 1920 and is of European origin, the very large majority being mestizos. There are few negroes. The number of landed proprietors, professional men, merchants, etc. is comparatively small (about one-sixth); the remaining five-sixths own no property, pay no taxes, and derive no benefits from the social and political institutions about them beyond the protection of the proprietors upon whose estates they live, the nominal protection of the State, and an occasional day's wage. Education has made no impression upon such people, and is confined almost exclusively to the upper classes, from which some of the most prominent men in Brazilian politics and literature have come.

The State of Ceará has formed a bishopric of the Roman Catholic Church since 1853, the bishop having his residence at Fortaleza. The State is represented in the national congress by three senators and ten deputies. The capital is Fortaleza, sometimes called Ceará, which is also the principal commercial centre and shipping port. Its population in 1926 was 78,986. The principal towns are Aracaty, Baturité, Acarahú, Crato, Maranguape and Sobral.

The territory of Ceará includes three of the *capitanias* originally granted by the Portuguese crown in 1534. The first attempts to settle the territory failed, and the earliest Portuguese settlement was made near the mouth of the Rio Camocim in 1604. The French were already established on the coast, with their headquarters at Saint Louis, now Maranhão. Ceará was occupied by the Dutch from 1637-54, and became a dependency of Pernambuco in 1680; this relationship lasted until 1799, when the *capitania*

of Ceará was made independent. The *capitania* became a province in 1822 under Dom Pedro I. A revolution followed in 1824, the president of the province was deposed 15 days after his arrival, and a republic was proclaimed. Internal dissensions immediately broke out, the new president was assassinated, and after a brief reign of terror the province resumed its allegiance to the empire. Ceará was one of the first provinces of Brazil to abolish slavery.

Soc.* vol. xlv., pp. 53-63, 69-79.

CEAWLIN (d. 593), king of the West Saxons, included, in the *Anglo-Saxon Chronicle*, among the "Bretwaldas" or specially powerful kings, succeeded his father Cynric in 560. He took Silchester, and moving eastwards Ceawlin and his brother Cutha defeated the forces of Aethelberht, king of Kent, at the battle of Wibbandun in 568. In 577 he led the West Saxons from Winchester towards the Severn valley; gained a victory over three British kings, Conmail, Condidan and Farinmail, at Deorham, and added the district round Gloucester, Bath and Cirencester to his kingdom, thus isolating the Britons of Cornwall from those of Wales. A further advance was begun in 583. Uriconium, a town near the Wrekin, and Pengwyrn, the modern Shrewsbury, were destroyed, but Ceawlin was defeated by the Britons at Fethanleag or Faddileigh, near Nantwich, and his progress was effectually checked. Internal strife among the West Saxons followed. In 591 Ceawlin lost the western part of his kingdom; in 592 he was defeated by his nephew, Ceolric, at Wanborough, driven from Wessex, and was killed in 593.

See *Two of the Saxon Chronicles*, ed. by C. Plummer (Oxford, 1892); E. Guest, *Origines Celticae* vol. ii. (1883).

CEBES, the name of two Greek philosophers. (1) CEBES OF CYZICUS, mentioned in Athenaeus (iv. 156 D), seems to have been a Stoic, who lived during the reign of Marcus Aurelius. Some would attribute to him the *Tabula Cebetis* (see below), but as that work was well known in the time of Lucian, it is probably to be placed earlier. (2) CEBES OF THEBES, a disciple of Socrates and Philolaus. He is one of the speakers in the *Phaedo* of Plato, in which he is represented as an earnest seeker after virtue and truth, keen in argument and cautious in decision. Three dialogues, the *Ἐβδόμη*, the *Φρόνιμος* and the *Πίναξ* or *Tabula*, are ascribed to him by Suidas and Diogenes Laërtius. The two former are lost, and most scholars deny the authenticity of the *Tabula* on the ground of material and verbal anachronisms. They attribute it either to Cebes of Cyzicus (above) or to an anonymous author, of the 1st century A.D., who assumed the character of Cebes of Thebes. In the form of an interpretation of an allegorical picture in the temple of Cronus at Athens or Thebes, it develops the Platonic theory of pre-existence, and shows that true education consists in the formation of character.

The *Tabula* has been translated both into European languages and into Arabic (the latter published with the Greek text and Lat. trans. by Salmasius in 1640); Eng. trans. by H. E. Seebohm (Chipping Camden, 1906). It is usually printed together with Epictetus. Separate eds. by S. S. Jerram (with intro. and notes, 1878), C. Prächter (1893), and many others. See Zeller's *History of Greek Philosophy*; F. Klopfer, *De Cebetis Tabula* (1818-22); C. Prächter, *Cebetis Tabula quam aetate conscripta esse videatur* (1885); R. T. Clark, *Characters of Theophrastus, etc.* (1909).

CEBU, a municipality (with administration centre and 79 *barrios* or districts), a port of entry and the capital of the province and island of Cebu (the most densely populated province of the archipelago), Philippine Islands, on the east coast, and the metropolis of the Bisayan group. Pop. (1918) 65,502, of whom 32,476 were males; only 333 of the total were whites. The surrounding country, which is level and fertile, is connected with other parts of the island by good motor roads. Cebu is the chief point on the railway which runs along the east coast of the island. The port,

formed by the north-west shore of the island of Mactan, is well protected from violent winds, and in front of it stands a picturesque Spanish fort. The streets are wide and regularly laid out. Cebu is an episcopal see, and the palace of the bishop, although small, is widely known for its interior decorations. The Augustinian church is famous for its so-called miraculous image of the Santo Niño, which dates from the time of Magellan's expedition. The cathedral was finished toward the end of the 18th century. Commercially, Cebu is the second centre of the archipelago. Abacá, tobacco, sugar and copra are the most important exports. In addition to the trade with foreign ports, a lucrative trade is carried on with Manila, Bohol, Negros, northern Mindanao and other parts. Salt, pottery and fabrics of silk, sinamay, abacá and cotton are manufactured, and sugar sacks are woven in considerable quantity. A meteorological station is established here. In 1918 Cebu had 143 manufacturing establishments, with output valued at 2,926,000 pesos, and 217 household industry establishments with output valued at 100,200 pesos. Of the 22 schools, 15 were public. A branch of the Philippine library has been established in Cebu. The site of the municipality had long been a village of the natives when the first Spaniards under Magellan landed on the island on April 7, 1521. Magellan was killed in the island of Mactan across from the municipality. The first Spanish settlement in the Philippines was established in Cebu by Miguel López de Legazpi in 1565, and from that year to 1571 it was the capital of the country. Cebu has had an important history and is now the commercial rival of Iloilo. It was first thrown open to foreign trade in 1863. The language spoken is Cebu-Bisayan.

CECCO D'ASCOLI (1257-1327), the popular name of FRANCESCO DEGLI STABILI, a famous Italian encyclopaedist and poet—Cecco being the diminutive of Francesco, and Ascoli, in the marshes of Ancona, the place of his birth. In 1322 he was made professor of astrology at Bologna university, but, having written a commentary on the sphere of John de Sacrobosco (pub. Venice, 1518), in which he propounded daring theories concerning the agency of demons, he got into difficulties with the clerical party. He betook himself to Florence, where his attack on the *Commedia* of Dante, and the *Canzone d'Amore* of Guido Cavalcanti sealed his fate. He was burned at Florence in 1327.

His *Acerba* (from *aceruus*), an encyclopaedic poem (best ed. Venice, 1510), consists of four books in *sesta rima*, treating in order of astronomy and meteorology, of stellar influences, of physiognomy, of the vices and virtues of minerals, of the love of animals, of moral, physical and theological problems.

See G. Castelli, *La Vita e le Opere di C. d'Ascoli* (Bologna, 1892), and C. Lozzi, *C. d'Ascoli* (1904).

CECIL, the name of a famous English family. This house, whose two branches hold each a marquessate, had a great statesman and administrator to establish and enrich it. The first Lord Burghley's many inquiries concerning the origin of his family created for it more than one splendid and improbable genealogy, although his grandfather is the first ascertained ancestor. In the latter half of the 15th century a family of yeomen or small gentry with the surname of Seyceld, whose descendants were accepted by Lord Burghley as his kinsmen, lived on their lands at Allt yr Ynys in Walterstone, a Herefordshire parish on the Welsh marches. Of the will of Richard ap Philip Seyceld of Allt yr Ynys, made in 1508, one David ap Richard Seyceld, apparently his younger son, was overseer. This David seems identical with David Cysell, Scisseld or Cecill, a yeoman admitted in 1494 to the freedom of Stamford in Lincolnshire. At Stamford he prospered, being three times mayor and three times member of parliament for the borough, and he served as sheriff of Northamptonshire in 1532-33. Remaining in the service of Henry VIII. he was advanced to be yeoman of the chamber and sergeant-at-arms, being rewarded with several profitable leases and offices. By his first marriage David Cecil left at his death in 1536 a son and heir, Richard Cecil, who enjoyed a place at court as yeoman of the king's wardrobe under Henry VIII. and Edward VI. A gentleman of the privy chamber and sometime sheriff of Rutland, Richard Cecil had his share at the distribution of abbey lands, St.

Michael's priory in Stamford being among the grants made to him. William Cecil, only son of Richard, was born, by his own account, in 1520, at Bourne in Lincolnshire. He advanced himself first in the service of the protector Somerset, after whose fall, his great abilities being necessary to the council, he was made a secretary of state and sworn of the privy council. In 1571 he was created Lord Burghley, and from 1572, when he was given the Garter, he was lord high treasurer and principal minister to Queen Elizabeth. By his first wife, Mary Cheke, sister of the scholar Sir John Cheke, tutor to Edward VI., he was father to Thomas, first earl of Exeter. By a second wife, Mildred Cooke, the most learned lady of her time, he had an only surviving son, Robert Cecil, ancestor of the house of Salisbury.

Created earl of Exeter by James I., the second Lord Burghley was more soldier than statesman, and from his death to the present day the elder line of the Cecils has taken small part in public affairs. William Cecil, 2nd earl of Exeter, took as his first wife the Lady Roos, daughter and heir of the 3rd earl of Rutland of the Manners family. The son of this marriage inherited the barony of Roos as heir general, and died as a Roman Catholic at Naples in 1618 leaving no issue. A third son of the 1st earl was Edward Cecil, a somewhat incompetent military commander, created in 1625 Lord Cecil of Putney and Viscount Wimbledon, titles that died with him in 1638, although he was thrice married. In 1801 a marquessate was given to the 10th earl of Exeter, the story of whose marriage with Sarah Hoggins, daughter of a Shropshire husbandman, has been refined by Tennyson into the romance of "The Lord of Burleigh." This elder line is still seated at Burghley, the great mansion built by their ancestor, the first lord.

The younger or Hatfield line was founded by Robert Cecil, the only surviving son of the great Burghley's second marriage. As a secretary of State he followed in his father's steps, and on the death of Elizabeth he may be said to have secured the accession of King James, who created him Lord Cecil of Essendine (1603), Viscount Cranborne (1604), and earl of Salisbury (1605). Forced by the king to exchange his house of Theobalds for Hatfield, he died in 1612, worn out with incessant labour, before he could inhabit the house which he built upon his new Hertfordshire estate. Of Burghley and his son Salisbury, "great ministers of state in the eyes of Christendom," Clarendon writes that "their wisdom and virtues died with them." The 2nd earl of Salisbury, "a man of no words, except in hunting and hawking," was at first remarked for his obsequiousness to the court party, but taking no part in the Civil War came at last to sit in the Protector's parliament. After the Restoration, Pepys saw him, old and discredited, at Hatfield, and notes him as "my simple Lord Salisbury." The 7th earl was created marquess of Salisbury in 1789.

Hatfield House, a great Jacobean mansion which has suffered much from restoration and rebuilding, contains in its library the famous series of state papers which passed through the hands of Burghley and his son Salisbury, invaluable sources for the history of their period. (O. B.)

(See also, EXETER, EARLS; MARQUESSES AND DUKES OF; members of the Cecil family separately mentioned are: BURGHLEY, WILLIAM CECIL; SALISBURY, ROBERT, 3RD MARQUESS OF; SALISBURY, ROBERT CECIL, 1ST EARL OF; CECIL, LORD HUGH; CECIL OF CHELWOOD, 1ST VISCOUNT).

CECIL, LORD HUGH RICHARD HEATHCOTE (1869-), English politician, youngest son of the 3rd Marquess of Salisbury, the prime minister, was born on Oct. 14, 1869, and was educated at Eton and University college, Oxford, where he obtained a first class in modern history in 1891, and was elected a fellow of Hertford college. He became one of his father's secretaries. He sat in the House of Commons as a Unionist for Greenwich (1895-1906), and for Oxford university from 1910 onward. He took a keen interest in church matters and was remarkable in debate for his oratorical powers and the loftiness of his ideals. In the stormy debates on the Balfour Education bill of 1902 he maintained that the only possible basis of general agreement was that every child should be brought up in the belief of its parents. He and Winston Churchill gathered round them, in the early years of the 20th century, a small group of young and able Con-

servative members, whose independent proceedings attracted some attention. He took a decided part in resisting tariff reform, and had no seat in the House between 1906 and 1910. He threw himself immediately and with passion into the struggle over the proposed curtailment of the powers of the House of Lords, and was active in resistance to the Parliament bill.

During the World War he joined the Flying Corps; he also served as a member of the commission that enquired into the Mesopotamia expedition. After the war he took a less active part in politics, but generally found himself in agreement with his brother, Lord Robert (later Lord Cecil of Chelwood), in adopting a more independent attitude toward the Coalition Government. With him, too, he supported the Enabling bill, and he became a prominent member of the Church Assembly set up in accordance with its provisions. In the conflict which arose over the Prayer Book Measure in 1928 he gave energetic support to the new proposals, both inside and out of the House of Commons, where his great knowledge on ecclesiastical questions commanded the respect of his opponents.

CECIL OF CHELWOOD, EDGAR ALGERNON ROBERT CECIL, 1ST VISCOUNT (1864–), British statesman, known before his elevation to the peerage as Lord Robert Cecil, third son of the third Marquess of Salisbury, was born on Sept. 14, 1864. He was educated at Eton and University college, Oxford, and was a prominent speaker at the Oxford Union. Lord Robert acted as one of his father's private secretaries from 1886 to 1888. He was called to the bar at the Inner Temple in 1887, and appeared in many important cases. He took silk in 1900.

In 1906 he entered parliament as Conservative member for East Marylebone, and he was one of the principal critics of Birrell's abortive education bill of that year. On many questions he took a heterodox position from the party point of view. In particular he dissociated himself from the tariff reform policy of Chamberlain, and thereby with Parliament from 1910 to 1911, when he was returned at a by-election for the Hitchin division of Herts, retaining this seat until his elevation to the peerage in 1923. He immediately resumed his old place as a powerful, though independent critic of Liberal policy, especially of the disestablishment of the church in Wales. He was one of the best friends of the women suffragists, and expressed the strongest disapprobation of the violent measures taken against them, though he did not palliate the offences against law and order of the extreme militants. Ultimately, after women had been granted the suffrage, he had the satisfaction of carrying a resolution "to amend the law with respect to the capacity of women to sit in Parliament" (Oct. 21, 1918).

Lord Robert was in office throughout the World War from the time that the Unionists associated themselves with the Government in May 1915 till the Armistice. As under-secretary for foreign affairs, then as minister of blockade and lastly as assistant secretary of State for foreign affairs, he was mainly concerned with the vital question of blockade. Lord Robert resigned at the general election of 1918 on the ground that he could not support the decision of the coalition Ministry to treat Welsh disestablishment as a *fait accompli*. Though no longer a minister of the crown, he nevertheless went over to Paris in 1919, where he served as chairman of the Supreme Economic Council, and played one of the principal parts, together with President Wilson and Gen. Smuts, in drafting the Covenant. After the peace he advocated increasingly full co-operation in the work of the League of Nations. In 1920 he attended the first Assembly of the League in Geneva as a representative of South Africa. In Parliament he steadily drifted into opposition to the coalition Ministry, and, though he did not form part of Bonar Law's Unionist Ministry in 1922, he joined Baldwin's first cabinet in May 1923 as Lord Privy Seal. He was raised to the peerage in Dec. 1923. He returned to office in Baldwin's second cabinet, in Nov. 1924, as chancellor of the duchy of Lancaster, and on several occasions acted as deputy for the foreign secretary, Sir Austen Chamberlain, on the Council of the League of Nations. As the principal British representative on the Disarmament Commission at Geneva in

1926–27 he found that his instructions necessitated a policy not in complete accordance with his convictions, and in 1927 he resigned his place in the Baldwin administration because the cabinet failed to support the British delegation in their suggestion of a compromise on the cruiser question to meet American objections on this point. As joint-president (since 1919) of the League of Nations Union he began a public campaign on the disarmament question.

CECILIA, SAINT (d. c. 176), patron saint of music and of the blind, is commemorated on Nov. 22. She was supposed to have been a noble Roman who with her husband and converts suffered martyrdom (c. 230), under the emperor Alexander Severus, but the researches of de Rossi (*Roma Sotteranea* ii. 147) confirm the statement of Fortunatus, bishop of Poitiers (d. 600), that she perished in Sicily under Marcus Aurelius (c. 176). The 4th century church at Rome in her honour was rebuilt by Pope Paschal I. (c. 820) and again in 1599. Cecilia, whose musical fame rests on a passing notice in her legend that she praised God by instrumental and vocal music, has inspired many a masterpiece in art, including the Raphael at Bologna, the Rubens in Berlin, the Domenichino in Paris, and in literature she is commemorated by Chaucer's "Seconde Nonnes Tale" and by Dryden's famous ode, set to music by Handel in 1736 and later by Sir Hubert Parry (1889).

Another St. Cecilia, who suffered in Africa in the persecution of Diocletian (303–304), is commemorated on Feb. 11.

U. Chevalier, *Répertoire des sources historiques* (1905), i. 826 f.

CECROPIA, in botany, a genus of trees (family Moraceae), native of tropical America. They are of rapid growth, affording a light wood used for making floats. *C. peltata* is the trumpet tree, so-called from the use of its hollow stems by the Uaupé Indians as a musical instrument. It is a tree reaching about 50 ft. in height with a large spreading head, and deeply lobed leaves 12 in. or more in diameter. The hollows of the stems and branches are inhabited by ants, which it has been claimed in return for the shelter thus afforded, and food in the form of succulent growths on the base of the leaf-stalks, repel the attacks of leaf-cutting ants which would otherwise strip the tree of its leaves. This is an instance of "myrmecophily," i.e., a living together for mutual benefit of the ants and the plant.

CECROPS, traditionally the first king of Attica (Pausanias ix. 33). He was said to have divided the inhabitants into 12 communities, to have instituted the laws of marriage and property and a new form of worship. The introduction of bloodless sacrifice, the burial of the dead and the invention of writing were also attributed to him. He is said to have acted as umpire during the dispute of Poseidon and Athena for the possession of Attica. As one of the *autochthones* (q.v.) of Attica, Cecrops is represented as human in the upper part of his body, while the lower part is shaped like a dragon. Miss J. E. Harrison (in *Classical Review*, Jan. 1895) endeavours to show that Cecrops is the husband of Athena, identical with the snake-like Zeus Soter or Sosipolis, and the father of Erechtheus-Erichthonius.

CEDAR, a name applied to several coniferous trees of the pine family (see GYMNOSPERMS).

Cedrus Libani, the far-famed Cedar of Lebanon, is a tree which, on account of its beauty, stateliness and strength, has always been a favourite with poets and painters, and which is frequently employed in the Scriptures as a symbol of power, prosperity and longevity. It grows to a vertical height of from 50 to 80 ft. and at an elevation of about 6,000 ft. above sea-level. In the young tree, the bole is straight and upright and one or two leading branches rise above the rest. As the tree increases in size, however, the upper branches become mingled together, and the tree is then clump-headed. Numerous lateral ramifying branches spread out from the main trunk in a horizontal direction, tier upon tier, covering a compass of ground the diameter of which is often greater than the height of the tree. The branchlets of the cedar take the same direction as the branches, and the foliage is very dense. The tree is evergreen; new leaves are developed every spring, but their fall is gradual. In shape the leaves are straight, tapering, cylindrical and pointed; they are about 1 in. long, dark green and grow in alternate tufts of about 30 in number. The

male and female flowers grow on the same tree, but are separate. The cones on the upper side of the branches are flattened at the ends and are 4 to 5 in. in length and 2 in. wide; they take two years to come to perfection and while growing exude much resin. The scales are close pressed to one another and are reddish in colour. The seeds are provided with a long membranous wing. The root is strong and ramifying. The cedar flourishes best on sandy, loamy soils. Cedars occur in great numbers on Mt. Lebanon, chiefly on the western slopes, not forming a continuous forest, but in groves, some of which contain several thousands of trees. There are also large forests on the higher slopes of the Taurus and Anti-Taurus mountains. The wood is fragrant, though not so strongly scented as that of the juniper or red cedar of America. It is generally reddish-brown, light and of a coarse grain and spongy texture, easy to work, but liable to shrink and warp. Mountain-grown wood is harder, stronger, less liable to warp and more durable.

The cedar of Lebanon is cultivated in Europe for ornament only. It can be grown in parks and gardens, and thrives well; but the young plants are unable to bear great variations of temperature. The term *Eres* (cedar) of Scripture does not apply strictly to one kind of plant; the "cedars" for masts, mentioned in Ezek. xxvii. 5, must have been pine-trees. Drawers of cedar or chips of the wood are now employed to protect furs and woollen stuffs from injury by moths. Cedar-wood, however, is said to be injurious to natural history objects, and to instruments placed in cabinets made of it, as the resinous matter of the wood becomes deposited upon them.

The genus *Cedrus* contains two other species closely allied to *C. Libani*—*Cedrus Deodara*, the deodar, or "god tree" of the Himalayas, and *Cedrus atlantica*, of the Atlas range, north Africa. The deodar forms forests on the mountains of Afghanistan, north Baluchistan and the north-west Himalayas; at an elevation of from 5,500 to 12,000 ft. it may grow to a height of 60 to 70 ft. before branching. The wood is close-grained, long-fibred, perfumed and highly resinous, and resists the action of water. The foliage is of a paler green, the leaves are slenderer and longer, and the twigs are thinner than those of *C. Libani*. The tree is employed for a variety of useful purposes, especially in building. It is now cultivated in England and in California as an ornamental plant. *C. atlantica*, the Atlas cedar, has shorter and denser leaves than *C. Libani*; the leaves are glaucous, sometimes of a silvery whiteness, and the cones smaller than in the other two forms; its wood also is hard, and more rapid in growth than is that of the ordinary cedar. It is found at an altitude of from 4,000 to 6,000 feet.

The name cedar is applied to a variety of trees, including species of several genera of conifers, *Juniperus*, *Thuja*, *Libocedrus*, *Chamaecyparis* and *Cupressus*. *Libocedrus decurrens* of western North America is known in the United States as incense (or white) cedar, and the name "white cedar" is applied to *Chamaecyparis Lawsoniana*, the Port Orford or Oregon cedar, a native of the north-west States. The Bermuda cedar (*Juniperus bermudiana*) and the red or American cedar (*J. virginiana*) are used in joinery and in the manufacture of pencils. The Japanese cedar (*Cryptomeria japonica*) is a kind of cypress. Another species of cypress (*Chamaecyparis thyoides*), found in swamps in the south of Ohio and Massachusetts, is known as the American white cedar. The Spanish cedar is *Juniperus thurifera*, a native of the western Mediterranean region, and also to another common species, *J. Oxycedrus* common in the Mediterranean region, forming a shrub or low tree with spreading branches and short, stiff, prickly leaves. A species of cypress, *Cupressus lusitanica*, naturalized in the neighbourhood of Cintra, is known as the cedar of Goa. The genus *Widdringtonia* of tropical and South Africa is also known locally as cedar. The family Meliaceae (which is entirely distinct from the conifers) includes, along with the mahoganies and other valuable timber-trees, the Jamaica and the Australian red cedars, *Cedrela odorata* and *C. Toona* respectively.

See Veitch, *Manual of Coniferae* (2nd ed., 1900); C. C. Rogers, *Conifers and Their Characteristics* (1920).

CEDAR-BIRD or **CEDAR WAXWING**: see **WAXWING**.

CEDAR CITY, a city of Iron county, Utah, in the southwestern part of the State, at an elevation of over 5,000ft.; on Federal highway 91, and the terminus of a branch line of the Union Pacific railway, constructed in 1923. The population was 3,615 in 1930 by the Federal census. It is the largest city within a radius of 200m.; is surrounded by vast expanses of grazing country and potential agricultural land, with some 50,000ac. in irrigated farms, and by great deposits of iron, coal and gypsum; and is the gateway to the Zion National park, Bryce canyon, the north rim of the Grand canyon, Kaibab forest and Cedar Breaks. A Branch of the State agricultural college is situated here. In 1849 an exploring party sent out by Brigham Young discovered the beds of iron ore which gave the county its name. A volunteer company established a colony at Parowan, the county seat, in 1851. Cedar City was settled in 1851, and became the centre of the iron industry of that period, sending 12,500 lb. of pig-iron to Salt Lake City in the next eight years, besides manufacturing many articles of iron. With the development of rail transportation from the east the industry languished. In 1923 mining was begun on a large scale around Iron Springs, 10m. W. of Cedar City, and the present production (by stripping methods) is about 250,000 tons a year, averaging 53% in iron content.

CEDAR CREEK, a small branch of the North Fork of the Shenandoah river, Virginia (U.S.A.). It is known in American history as the scene of a memorable battle, which took place on Oct. 19, 1864, between the Union army under Gen. Sheridan and the Confederates under Gen. Early. (See **SHENANDOAH VALLEY CAMPAIGNS**.)

CEDAR FALLS, a city of Black Hawk county, Iowa, U.S.A., on the Cedar river, 100m. W. of Dubuque. It is on Federal highways 20 and 218, and is served by the Rock Island, the Illinois Central, The Chicago Great Western and the Waterloo, Cedar Falls and Northern railways. The population in 1930 (Federal census) was 7,362. Imported breeds of horses, cattle and sheep are raised in the surrounding country, and there are large deposits of sand and limestone. The city utilizes its water-power for sundry manufactures. It is the seat of the State Teachers college (established in 1876 as a normal school), which has a resident enrolment of over 7,000. Settlement began here in 1847. The town was laid out in 1851, and chartered as a city in 1865.

CEDAR RAPIDS, a city of Linn county, Iowa, U.S.A., on the Cedar river, in the east-central part of the State. It is on Federal highways 30 and 161; and is served by the Chicago, Milwaukee, St. Paul and Pacific, the Chicago and North Western, the Rock Island, the Illinois Central, the Cedar Rapids and Iowa City and the Waterloo, Cedar Falls and Northern railways. The population was 25,656 in 1900; 45,566 in 1920 (5,863 foreign-born white, of whom 2,833 were from Czechoslovakia); and 56,097 Federal census in 1930. The rapids in the river supply abundant water-power, and the city ranks second in the State (1925) as a manufacturing centre, with an aggregate factory output valued at \$89,626,868. "Quaker oats" is the leading product. Others of importance are pork and beef products, pumps, machinery for dairies and creameries, starch, lumber and patent medicines. The Rock Island Railway has large car shops here. The city has an extensive jobbing business in all staple lines, and is the distributing centre for a rich agricultural district. Bank deposits in 1926 amounted to \$485,469,000.

The city has an air of substantial prosperity. Its principal streets are 80-100ft. wide, well paved and shaded. The assessed valuation of property in 1927 was \$20,842,698. There are five fine parks, in one of which (Frontier) an annual rodeo show is held. Three Bohemian periodicals and one Swedish, with a substantial circulation, are published here. Coe college, a co-educational Presbyterian institution, which grew out of the Cedar Rapids Collegiate Institute (1851), was chartered under its present name and opened in 1881. It has an enrolment of 1,300. At Mt. Vernon, 17m. E. by S., is Cornell college (Methodist), one of the oldest colleges west of the Mississippi, which was opened in 1853 as Iowa Conference seminary and re-incorporated as Cornell college in 1855.

Cedar Rapids was settled in 1838; incorporated in 1856; and adopted a commission form of government in 1908.

CEDARTOWN, a city of Georgia, U.S.A., 52m. west-north-west of Atlanta, served by the Central of Georgia and the Seaboard Air Line railways; the county seat of Polk county. The population in 1920 was 4,053 (22% negroes), and had increased to 8,124 in 1930 by the Federal census. There are important mineral deposits in the vicinity, especially of iron, manganese, marble and slate. Hydro-electric power is available and the town has railroad shops, cotton mills, a tyre and rubber factory and various other manufacturing industries. It was incorporated as a city in 1898.

CÉDULA, the Spanish form of the English word schedule (*q.v.*), of which "cédula" is an obsolete variant; in modern financial usage it refers more specifically to certain securities issued by the South American Governments.

CEFALU (anc. *Cephaloedium*), a seaport and episcopal see of the province of Palermo, Sicily, 42 m. E. of Palermo by rail. Pop. (1921) 10,799 (town), 13,197 (commune). The ancient town is named from the headland (Gr. *Κεφαλή*, head) upon which it stood (1,233 ft.); its fortifications extended to the shore, on the side where the modern town now is, in the form of two long walls protecting the port. There are remains of a wall of massive rectangular blocks of stone at the modern Porta Garibaldi on the south. It does not appear in history before 396 B.C., and seems to have owed its importance mainly to its naturally strong position. A small ancient building in good polygonal work (a style of construction very rare in Sicily), consists of a passage on each side of which a chamber opens. The doorways are of finely-cut stone, and of Greek type. On the summit of the promontory are extensive remains of a Saracenic castle. The new town was founded at the foot of the mountain, by the shore, by Roger II. in 1131, and the cathedral was begun in the same year. The exterior is well preserved, and is largely decorated with interlacing pointed arches; the windows also are pointed. On each side of the façade is a massive tower of four storeys. The round-headed Norman portal is worthy of note. The interior was restored in 1559, though the pointed arches of the nave, borne by ancient granite columns, are still visible: and the only mosaics preserved are those of the apse and the last bay of the choir: they are remarkably fine specimens of the art of the period (1148) and were carefully restored in 1859-62. Fine cloisters, coeval with the cathedral, adjoin it.

CEHEGÍN, a town of south-eastern Spain, in the province of Murcia, on the right bank of the river Arcos, a small tributary of the Segura. Pop. (1920) 13,684. Cehegín is the market for local wine, olive oil and hemp, and for marble and a little iron from the neighbouring hills. Some of the older houses, the parish church and the convent of San Francisco, which contains still legible Roman inscriptions, are built of stone from the ruins of Begasri, a Roman colony which stood on an adjacent hill. The name Cehegín is sometimes associated with that of the Zenaga, Senhaja or Senajeh, a North African tribe which invaded Spain in the 11th century.

CEILING, the overhead surface or surfaces covering a room; the under side of a floor or a roof; often used as a surface built to hide the floor and roof construction; the term is also employed, technically, for any finished boarding or sheathing, and especially for a type of narrow, thin board, tongued and grooved, with a moulding on the edge. Ceilings, in the larger sense of the word, have been favourite places for decoration from the earliest times, by painting the flat surface, as in the case of Egyptian tombs; by emphasizing the structural members of roof or floor, as in the beamed ceilings of the period of Francis I. in France, or the ceilings of Italian mediaeval churches; *e.g.*, S. Miniato at Florence; by treating it as a field for an over-all pattern of relief; *e.g.*, the earlier rooms of Hampton Court palace near London.

Of Greek ceilings little is known, except for some of marble, over temple porticos, decorated with small, sunk panels or coffers, with moulded edges, and the field further decorated in polychrome. Roman ceilings were rich with relief and painting as is evidenced by the vault soffits of Pompeian baths. Italian Renaissance architects found in similar examples inspiration for much

of their most charming painted and relief decoration in stucco, and Robert Adam's 18th century designs for ceilings ornamented with ovals, fans, hanging garlands, delicate scrolls and little painted panels, have the same origin. The general Gothic tendency to use structural elements decoratively led to the rich development of the beamed ceiling, in which large cross girders support smaller floor beams at right angles to them, beams and girders being richly chamfered and moulded, and often painted in bright colours (the palazzo Davanzati in Florence contains numerous late 14th century examples).

In the Renaissance, ceiling design was developed to its highest pitch of originality and variety. Three types were elaborated. The first is the coffered ceiling, in the complex design of which the Italian Renaissance architects far outdid their Roman prototypes. Circular, square, octagonal and L-shaped coffers, with their edges richly carved and the field of each coffer decorated with a rosette, abound. Occasionally pendants are found at the intersections (the Hall of the Two Hundred, in the Palazzo Vecchio at Florence and various rooms of the ducal palace at Mantua are good examples). The second type consists of ceilings wholly or partly vaulted, often with arched intersections, with painted bands bringing out the architectural design and with pictures filling the remainder of the space, as in the loggia of the Farnesina villa in Rome, decorated by Raphael and Giulio Romano. In the baroque period, fantastic figures in heavy relief, scrolls, cartouches and garlands were also used to decorate ceilings of this type; *e.g.*, the Pitti palace, Florence; many French ceilings of the Louis XIV. style are similar. In the third type, particularly characteristic of Venice (*e.g.*, the Doge's palace), the ceiling became one large framed picture.

The early Renaissance saw in England another interesting development, that of plaster ceilings covered with an intricate pattern of intersecting curved lines, ornamented with foliage, grotesque animals and heraldic devices, and frequently accented by repeated large pendants; *e.g.*, Bramall Hall; Hatfield House, London; Knowle; Sizergh. Later, the skilful English plaster workers were trained into a more classic vein, largely through the influence of Inigo Jones, who developed a type with large and deeply recessed panels, bold mouldings and bands of high relief foliage and fruit, which remained fashionable for about a century after 1650. In modern work the general tendency is toward simplified ceilings. Rich colour decoration is, however, sometimes found, especially in public buildings; *e.g.*, Nebraska State capitol, U.S.A., designed by B. G. Goodhue, with ceilings by Hildreth Meière.

(T. F. H.)

CEILLIER, REMY (1688-1761), Benedictine monk of the Lorraine congregation of St. Vannes, was born at Bar-le-Duc on May 14, 1688. He was the compiler of a scholarly Patrology, *Histoire générale des auteurs sacrés et ecclésiastiques* (23 vols. Paris, 1729-63, improved edition, 14 vols. Paris, 1858). His *Apologie de la morale des pères de l'église* (Paris, 1718), also won some celebrity.

CELAENAE, an ancient city of Phrygia, situated on the great trade route to the East. It was the starting point of the march of Cyrus (401 B.C.) with the 10,000 against Artaxerxes. Its acropolis long held out against Alexander in 333 and surrendered to him at last by arrangement. Antigonos made it the capital of his kingdom; Antiochus of Syria, the son of Seleucus re-founded it on a more open site as Apameia (*q.v.*). West of the acropolis were the palace of Xerxes and the Agora, in or near which is the cavern whence the Marsyas, one of the sources of the Maeander, issues.

See G. Weber, *Dinetr-Celènes* (1892).

CELANDINE (*Chelidonium majus*), a common British plant, a member of the poppy family (*Papaveraceae*), an erect branched herb from 1 to 2 ft. high with a yellow juice, much-divided leaves and yellow flowers nearly an inch across, succeeded by a narrow, thin pod opening by a pair of fine valves, separating upwards. The plant grows in waste places and hedge-rows, and is probably an escape from cultivation. It has become widely naturalized in eastern North America, in open grounds, roadsides and in woods from Maine to Ontario and Illinois south-

ward to North Carolina. The lesser celandine is a species of *Ranunculus* (*R. Ficaria*), a small low-growing herb with smooth heart-shaped leaves and bright yellow flowers about an inch across, borne each on a stout stalk springing from a leaf-axil. It flowers in early spring, in pastures and waste-places. It is sparingly introduced into the United States from Massachusetts to Maryland.

CELANO, a town of the Abruzzi, Italy, province of Aquila, 73m. E. of Rome by rail. Pop. (1921) 7,744 (town); 9,485 (commune). It is on a hill above the Lago Fucino, and is dominated by a square castle, with round towers at the angles, erected in its present form in 1451. It contains three churches with 13th century façades in the style of those of Aquila. The origin of the town goes back to Lombard times, but it was destroyed in 1223, and rebuilt on a different site in 1227. It was damaged by the earthquake of 1915. It was the birthplace of Thomas of Celano, author of the *Dies Irae*, and biographer of S. Francis and S. Clara.

CELEBES (1), one of the four great Sunda islands in the Dutch East Indies. It extends from 1° 45' N. to 5° 37' S. and from 118° 49' E. to 125° 5' E. From the backbone of the island, which runs north and south, three long peninsulas project north-east, east and south-east, respectively, the first being much the longest. These peninsulas form great gulfs—on the eastern side, from north to south they are: the Gulfs of Tomini, or Gorontalo, Bolo and Boni, the first being the largest. Thus the island is of very curious shape, and its length, 800m., and coast-line, 2,000m., are quite disproportionate to its breadth, which averages between 36 and 120m., and at one point narrows to eighteen. As a result, no place in Celebes is as far as 70 miles from the sea. Celebes is situated in a very deep sea, between Borneo, west, which is in a shallow sea, on a shelf off the continent of Asia, and New Guinea, east, also in a shallow sea, and on a shelf projecting from Australia. The coast is dangerously fringed by drying coral reefs with many shoals and banks. The whole island is mountainous. Two parallel ranges run from north to south in the main central mass, and a northern extension of this traverses the entire northern arm of Celebes to Manado. From these ranges a single range projects north-eastwards to the extreme end of the eastern arm of the island, and two parallel ranges run, in a south-easterly direction, throughout the greater part of the south-eastern arm. The great central ranges (with Mt. Koruwe, centre, and Mt. Bonthain, south, over 10,000ft.), throw out large spurs, which dominate the central and western parts of Celebes. In the extreme north-east (Mt. Klabat, 6,620ft.), and south, the mountains are volcanic, some in the former region being active, whilst solfataras and hot springs are found in Minahasa. Wide rift valleys between the mountain ranges contain several lakes—in the north (Minahasa), Tondano, 2,000ft. above sea level, 9m. long and 3½m. wide, (Gorontalo), Limboto, Batudaka, and Bolano Sawu, in the central nucleus, Lake Lindu, further south, in the same rift, Tempe and Sidenreng (monsoon lakes), and east of these, extending into the south-eastern arm, the principal lakes of the island—Poso, Matana and Fowuti. They are very deep, Matana having been sounded to 1,500 and Poso to 1,000 feet.

The rivers of Celebes are short and unimportant, for waterfalls

GREATER CELANDINE. A YELLOW FLOWERED PLANT OF TEMPERATE REGIONS. SOMETIMES USED IN MEDICINE

and rapids are frequent; their mouths are obstructed by bars, and there is very little coastal plain, save at Luwu (head of Gulf of Boni) and near Macassar and among mangrove-swamps of the north coast of the Gulf of Tomini. The Jenemeja, which flows into the Gulf of Boni, is wide and navigable for some distance from its mouth, the Poso, which enters the Gulf of Tomini, is also wide and navigable, for very small craft, to Paluasi, the Sadang, entering the Gulf of Mandar, on the south-west coast, has many affluents, and is navigable by sampans, the Lasolo, south-east, admits steamers for 16 miles from its mouth; the rivers of Gorontalo are very small. The best natural harbours are Menado bay, Amurang bay, Kwandang bay, and Dondo bay, on the north coast; Tambu bay, Pare Pare bay, and Palu bay (Donggala), on the west coast; Gorontalo and Poso, in the Gulf of Tomini, with the Gulf of Poh, which penetrates eastward for 22 miles; the bays of Tomori, Kendari, and Staring, in the Gulf of Tolo, and the bays of Mengkoka, Palopo, Usu (Luwu), and Sopang, in the Gulf of Boni. Off the west coast is the Spermdunde archipelago, a number of low islands surrounded by coral reefs, off the south coast, Saleyer (*q.v.*), at the end of the south-eastern peninsula are several islands, of which the most important are Kabaena, Muna, Wowoni, and Buton (*q.v.*). They are separated from the peninsula by the straits of Tioro and Wowoni, both dangerous. The Banggai, or Peling islands lie off the eastern extremity of Celebes, and though they belong politically to Ternate, geographically they resemble Celebes. In the Gulf of Tomini are the Schilpad islands, extending for nearly 80 miles east and west, the chief of them Talata Koh, Togian and Batu Daka, the Sangi or Sangir islands (*q.v.*), form the north-east extension of Celebes towards Mindanao, in the Philippines, which is continued by the Talaua group, north-east of these. With the adjacent islands, the area of Celebes is estimated at 77,855 sq.m. and without them—69,255 sq.m. The population of Celebes and the islands under its government, including the residency of Menado, was, in 1927, 3,435,664.

Its situation between the two shelves of the Asian and Australian continents makes the geology of Celebes specially interesting. The broad central block is a complex of igneous rocks, with granite, gneiss, diorite and amphibolite characters, pierced in places by later eruptives, mostly Tertiary. This block is enclosed around its base by Cretaceous rocks, overlaid by Tertiaries and recent alluvial deposits towards the coasts. In the south-east corner of the block there is a broad band of pre-Tertiary tuffs, fringed occasionally by coral limestone. The northern part of the Gulf of Boni is widely bordered by Pleistocene and alluvial deposits, resting in the north-east upon late Tertiaries: a band of old plutonic rocks stretches from near Paloppo across the Gulf of Boni and the south-east peninsula to the Gulf of Tolo.

The meridional ridge of Celebes has an axis of crystalline schist, tourmaline quartzite, and glaucophane schist, penetrated and overlaid by andesite and basalt, flanked by tuffs, overlaid by late Tertiary *Orbitoides* limestone. The southern extension from the central block shows late Tertiary limestone, raised in parts, to a height of more than 3,000ft. and portions of the Archaean foundation are revealed. East of the central block is a faulted and depressed area of crystalline schists and metamorphosed shales, with gneiss and metamorphic limestones. The south-eastern and eastern peninsulas are, in the main, a broken crustal block with plutonic rocks. Metamorphics run southwards along the Gulf of Boni inland, a series of Pleistocene to recent rocks passes near to north of Muna island, with no Tertiaries except a small patch on Buton island. Around Mengkoka bay is a fringe of coral limestone, which borders Kabaena, covers more than two-thirds of Muna, all except the centre of Buton, and all of Wowoni, and the small islands north of it. There are indications of Jurassic rocks south of Lake Matana and metamorphics re-appear in Peling island. The north-eastern peninsula has northern and southern belts. The northern belt consists mostly of sedimentary rocks, Cretaceous or Tertiary, some altered by metamorphism. This belt runs parallel with the coast, and is separated by a parallel fault line from the southern belt, which consists of granites, gneisses, schists and intrusives, with Archaean schists and altered rocks, caught in faults: the valleys are filled with recent deposits.

Older rocks, Cretaceous and Tertiary, are preserved in occasional east and west bands, and in places near the south coast there are fringes of coral limestone. Minahasa is volcanic, and differs structurally from any other portion of Celebes.

The climate of Celebes is hot, but is tempered by sea winds, which reach every part. Mean temperature ranges between 86° and 72°, with absolute extremes of 94° and 66°: it falls to below 50° at high altitudes on the mountains. At Palu, on the west coast, rainfall averages only 20.92 in., as compared with 116.11 at Macassar, whilst Menado and Gorontalo, both in the north-eastern peninsula, average, the former 106.48 in., and the latter 47.45 only. Macassar averages 132 rainy days annually; Palu only 77.

In the matter of fauna Celebes is the poorest island in the archipelago in the number of its species, yet amongst these it has animal forms which have no close allies in any other part of the world, except in three of the neighbouring islands—Bachian, Buru and Sulu. Most interesting of these are the *babi-rusa*, or pig-deer, so named by the Malays from its long and slender legs, and curved tusks, resembling horns, the black, crested baboon (*Cynopithecus nigrescens*), akin to the African baboon, and the *anoa*, or dwarf-buffalo, hunted extensively by the natives for its flesh. There are peculiar varieties of other indigenous animals, including five squirrels, a pig, a deer, two wood-rats and two marsupials. Celebes has a number of peculiar species of parrots, woodpeckers, hawks, cuckoos, hornbills, starlings, flycatchers and pigeons; the Brush turkey is found there. Crocodiles are common, there are snakes of various kinds, and many peculiar species of beetles and butterflies, whilst there is a distinct cleavage between the freshwater fishes of Borneo and Celebes. Although it has species which belong neither to the one nor to the other, the fauna of Celebes is more Asiatic than Australian, and the island is established as a transitional region between the Oriental and Australian zoological regions: it is one of the oldest parts of the Archipelago.

Much of Celebes is still covered with forest, especially around the Gulf of Tolo, where it is almost primeval, and practically without tracks or clearings. The vegetation grows on the sides of precipitous and almost vertical mountain slopes, and the scenery is exceedingly varied and picturesque. "Nowhere in the archipelago," wrote A. R. Wallace, "have I seen such gorges, chasms and precipices as abound in the district of Maros; in many parts there are vertical or even over-hanging precipices five or six hundred feet high, yet completely clothed with a tapestry of vegetation." The rift valleys are extremely fertile, and there are extensive plateaux, at varying heights, where there is rich pasture land. The flora shows many resemblances to that of the Philippines, is more Indian in character in the west of the island, and more Australian in the east, and whilst the trees of the lower slopes of the mountains differ strongly from those of Java, and are smaller, the alpine flora is very similar. There are many kinds of palms—fan-leaf, rattan, sago, *Arenga saccharifera*, which gives fibre for ropes, juice for sugar, and a beverage known as "sagueir;" bamboo, bread-fruit, tamarind and coconut trees flourish, copra being an extensive article of trade. Staple food crops grown are rice (mostly *sawah*) and maize; sugar-cane, tobacco and vegetables are also raised. The chief crop for export is coffee, and other crops grown for the market are rubber, kapok and nutmegs; copal, damar and rattan are collected, also cattle horns and hides, for export. Fishing for turtles and mother of pearl is carried on extensively, and there is a trade in ebony, sandal-wood and timber of other kinds. *Kayulara* and *Kolaka*, two kinds of timber almost impervious to attacks of the pile-worm are found in Celebes, and there is teak on the island of Muna. Gold occurs in Menado, and there are three mines being worked there; nickel has been found, also iron, copper and lead, and in South Celebes, a little coal.

In Minahasa there are 105 people to the square mile, in other parts of Menado only 30, and in the rest of the island and dependencies, 37. The coasts are generally well populated: there are large stretches of mountainous territory entirely uninhabited. There are at least six quite different native peoples of Celebes—the Toala, Toraja, Buginese, Macassars, Minahasese and Gorontalese. The first-named are found scattered all over the island, sometimes living in communities amongst other races, the result of

having been enslaved by them originally. It is thought that they represent the true aborigines of Celebes. They are short and dark and have wavy or curly hair, a broad, flat nose, prominent mouth, and receding chin. They are quite undeveloped and uncivilized, shy, jungle-dwellers, partly nomadic, but quiet good-tempered people, and with a distinct language of their own. The Toraja are a collection of tribes, living in central, south-east and east Celebes. Living in isolated groups, in a very thinly-populated country, they differ very much in development. Of Malayo-Polynesian stock, and divided into highland and lowland people, in some parts they have intermingled with the Toala; in others they have come under a Buginese and Macassarese civilizing influence. They are pagan (with an increasing Mohammedan element), are gradually giving up their fortified villages, in very inaccessible positions, for neat little settlements of houses standing each in its own garden, and they are becoming reconciled to the Dutch prohibition of head-hunting and of divination by spear-throwing, but they are unclean, short-lived, and weakly. The mountain peoples are more strongly built than those of the plains, with more prominent cheek-bones, thinner lips, and smaller eyes. Both have large mouths, thick lips, and, usually, a broad nose, skin varying from light to dark brown, and smooth, black hair, worn long. They are lazy, the women working harder than the men, but courteous and good-tempered, when their confidence has been gained. They are agriculturists, with only a few industries, such as plaiting, pottery, wood-carving and iron-working. Bark clothing is worn in remote districts, and Malayan style cotton garments where there is contact with superior races: many ornaments are worn, and teeth are filed. Society is organized on the family basis, and the tribe is an extension of the family, a man choosing a wife from another branch of his own family. There are no social distinctions, or tribal chiefs, and woman has, comparatively, a high position amongst the Toraja, being able to choose her own husband. They collect forest produce, and grow rice, possess their own language, with many dialects, and Christian schools are well received by them. The Buginese and Macassars are probably of Toraja descent, came into touch with Hindu culture in Southern Celebes, their home, and later were converted to Islam. They are now all Mohammedans, but with traces of Hinduism and paganism. Well built, fairly light-skinned, and energetic, they are very keen traders, of very moderate morality, proud, passionate and vindictive, devoted to feasting, gambling and cock-fighting. As ship-builders and sea-farers, they are unsurpassed in the Archipelago; their excellent prahus are to be found everywhere in Malayan seas. Society is both endogamic and exogamic, with survivals of a matriarchate, but Mohammedan law and customs are displacing all others. Both peoples are abstemious, feed chiefly on rice, maize and fish, eating buffalo flesh on festive occasions only: clothing is Malayan in style. They are extremely industrious, but their industries are not in a high state of development. Weaving is one of the chief; cotton *sarongs*, of fine material, being exported in large numbers from Mandar. Plaited goods of superior quality are made in Boni, gold and silver-smiths are mostly in Macassar, Gowa, Mandar and Boni, ironworkers in Luwu, Laiwui and Mandar, whilst shipbuilders flourish in Pambauwang, the Bira regency, and elsewhere. Forest produce is collected, buffaloes, cattle and horses are kept, hunting and fishing are indulged in, for pleasure and as a means of livelihood, and their sea-carrying trade thrives in spite of steamship competition. A peculiar written alphabet, shared by Buginese and Macassars, is used also by some of the tribes of northern Celebes, and by people of Sumbawa. The Macassar language and Buginese, to which it is very nearly allied, belong to the Malayo-Javanese group. Arabic letters are now being used for religious literature, and books in Arabic are read. There is a slight native literature, historical, legal, epistolary, and poetical. The Buginese and Macassars, like other races in Celebes and throughout the Archipelago, are adopting Malay as a *lingua franca*, and are encouraged therein by Dutch authority. The Minahasese are quite distinct in type from the other inhabitants of Celebes, they are closely related to the people of the islands of Siau and Sangi, and are probably part of an immigrant race from the north which settled here, and in the Philippines, of partly Cau-

casian type. They have a very light skin (some of the women have red cheeks and lips), lighter than any other race in the Archipelago, high nose, prominent lips, eyes widely separated, stiff, short, black hair and pleasant features, and they are tall and strong. Like the Maoris, a few generations back they were a savage, warlike race, constantly engaged in raids and head-hunting. European influence has completely eliminated this, and today the Minahasese are Christian, live in European style (each village has its church and school), are cleanly, sober and industrious, make good soldiers, being used extensively in the Dutch Colonial army and police, and compete successfully with Amboinese and Eurasians as clerks, schoolmasters, etc. They have a native tongue, but Malay and Dutch are superseding it. Their territory proper is in the extreme north and north-east, cultivation (coffee, coconuts and spices are grown largely), is in the European style, and their numbers do not exceed 200,000. The Gorontalese, who live in the west and south of the north-eastern peninsula, are of the Toraja family, not related to the Minahasese, and largely Mohammedan, a short, smooth-haired, and rather light-skinned people, with a marked difference between the people of the coast and inland. They are agriculturists (rice, maize, coconuts and tobacco are grown), forest products collected, and weaving and plaiting are carried on, some of the finest materials in Celebes being produced. They are neither strong nor very industrious; preponderance of women has encouraged extensive polygamy. In numbers they are estimated at about 125,000. Pagan (inland) and Mohammedan coastal tribes live on Banggai and Peleng.

For administrative purposes Celebes is divided into two separate divisions—the government of Celebes, with dependencies (south-eastern, southern peninsulas and islands, and the west coast), and the residency of Menado (the north-eastern peninsula and the coast of the Gulf of Tomini): the eastern peninsula, and the Banggai islands belong, politically, to the residency of Ternate. The population of Celebes and dependencies is 2,471,144, composed of 4,017 Europeans and Eurasians, 16,576 foreign Asiatics, including Chinese and Arabs, and 2,450,551 natives. The population is much larger on the coasts than inland. The chief port and trade centre and the seat of the Governor is Macassar (*q.v.*), with a population of 53,699. All the other towns of any importance of Celebes, quite small in comparison with Macassar, are on the coast, for communications hardly exist inland, although the whole country is under direct Dutch rule, with some modification in a few districts of Menado and in the two small States of Luwu and Wajo, where the “short declaration” applies. Authority is enforced by officials on tour and just suffices to pave the way for civilization. Bonthain, on the south coast, is a small port and trade centre (population 2,302), such, also, are Paré-Paré, Barru, Mamudyu, Simpaga and Donggala, on the west coast, the last-named of most importance (population 2,344), and the seat of an Assistant-Resident. On the Gulf of Boni are Kajang, Palima, Desu Bay, Palopo and Kolaka, and on the east coast and Gulf of Tolo—Kendari, Salabanka, Bunku, Koloneday and Luwuk, and on the southern shore of the Gulf of Tomini—Pagimana, Bunta, Posso and Parigi. Some of these places are very small, but all are ports of call for ships of the Royal Packet Navigation Company and trade centres, zones of collection for great tracts of the hinterland. Menado has a population of 967,520, including 2,151 Europeans and Eurasians, and 17,795 foreign Asiatics. The chief port and centre of administration is Menado (*q.v.*), in the extreme north-east, on Menado Bay, with a population of 22,767. Unlike the rest of Celebes, Menado has centres of population inland, on plateaux amongst the mountains, and of these Tondano (2,000ft.), and near the lake and river of the same name, is the chief, with a population of 14,167. It has a cool, refreshing climate, and, situated amidst beautiful mountain scenery, is quite a health resort. A pretty little town near by is Tomohon, a few hundred feet higher, which has a training school for native girls and a training college for native preachers, and a wireless station. Gorontalo, on the south coast of the peninsula, is a very important port and trade centre. It has an excellent harbour, with a magnificent approach, mountain ridges, thickly clad with vegetation running down to the shore, on either side of the narrow Gorontalo

bay. (Lake Limboto is not far distant.) It has a population of 3,498, does a busy trade in copra, coffee and other products, and, like Menado, is in direct touch with ports in Java, Singapore and principal world ports. Small ports on the north coast are Amurang, on the bay of that name, and with a safe anchorage in all weathers, Kwandang, on Kwandang bay, having ruins of an old fort, and Palehleh, a centre for the gold-mining district, near by; on the south-east coast are Kema, Buna and Jiko: on the west coast, Sabang. All these ports are served by vessels of the Royal Packet Navigation Company. There is a short government-operated tramway (47km. long), from Macassar to Takalar, but sea transport provides the principal, and in most parts, the only means of communication, though motor roads exist in Menado and southern Celebes. Macassar has cable communication with Java, Menado with Borneo, and Gorontalo with Ternate (Moluccas); there is a telegraph line between Amurang and Menado, and Macassar, Menado and Gorontalo have telephone systems. Imports and exports were respectively, in 1926, for Menado 12,613,909 and 27,664,673 guilders, and for Celebes and dependencies 25,429,420 and 41,112,813 guilders.

The Portuguese appear to have discovered and established some influence in Celebes in 1512 when they were monopolizing the spice trade of the Moluccas. The sultan of Macassar, as head of the State of Gowa (south-western Celebes) favoured the Portuguese, and the English, who later attempted to get a footing in Celebes. This annoyed the Dutch, who defeated the sultan early in the 17th century, though the Portuguese helped him. In 1607 a Dutch settlement at Macassar began to establish a firm trade footing in southern Celebes. The Dutch then used the sultan to check the power of Ternate in the Moluccas, and with their friendship he was able to subdue Boni, a rival state in south-east Celebes, and to hold Luwu, but he grew too powerful, and the Dutch (1654) conquered the island of Tidore in spite of a Macassarese fleet. War with Gowa, interrupted only by indecisive treaties, lasted till 1667, when the Dutch Admiral Speelman crushed Gowa and the Macassarese, with help from Boni, and imposed the Bongay treaty. Gowa abandoned all claims to supremacy, surrendered lands to the Dutch East India Company, left to it trade monopoly, and fell into decay. Boni's growth in power led the Dutch later to protect the independence of Gowa but the Dutch used their Buginese allies of Boni in the early wars in Java, and during the British occupation of Java, Raffles had to send an expedition to Celebes against the unruly Buginese in Boni. When Dutch power in Java was restored, a Dutch expedition had to be sent to Boni, but it was not until 1848 that Boni submitted to the Bongay treaty in a revised form. The treaty was not kept and a second expedition, in 1859, made Boni a fief of the Netherlands Government, whilst part of its territory was ceded to the Dutch. The last prince, La Pawowoni Kraeng Segeri, refused in 1905 to pay certain dues and interfered with other States, and he was banished, and Boni then lost its independence completely. About the same time Gowa interfered in another part of Celebes. The Dutch sent troops and in 1911, Gowa, too, was incorporated in Dutch territory. The State of Luwu signed the Bongay treaty in 1667, but it was not until after the Boni War, in 1861, that the Dutch succeeded in establishing any real influence there and there was some trouble in 1886 over the refusal of Luwu to pay a fine for the murder of some shipwrecked sailors on its coast, but in 1905 it agreed to abide by the “short declaration,” which then was also applied to the State of Wajo, likewise a signatory of the Bongay treaty, but which had at times been in open revolt, often in trouble with Boni, and had experienced serious internal disorder as recently as 1902. Menado was first colonized by the Spaniards, on the northern coast, and settlers were attracted from neighbouring islands. The sultan of Ternate also claimed suzerainty over it, and fairly early in the 17th century the Dutch entered into relations with the natives of the country to protect them from both Spaniards and Ternate. In 1657 the present capital and fort were built, at Menado, and a trade agreement was signed for the delivery of a certain amount of iron-wood annually. In 1677 the Sangi and Talau islands, and later, certain small kingdoms on the north coast, were placed under the rule of the Dutch Governor of Ter-

nate, and from that time onwards Dutch influence expanded, until direct Dutch rule over Minahasa only was extended to the Gorontalo lands and the Sangi islands, and today all Menado is under direct rule, with the exception of a few small kingdoms, with which a satisfactory agreement has been made.

CELERY (*Apium graveolens*), a biennial plant (fam. Umbelliferae) which, in its wild state, occurs in England by the sides of ditches and in marshy places, especially near the sea, producing a furrowed stalk and compound leaves with wedge-shaped leaflets, the whole plant having a coarse, rank taste and a peculiar smell. It is also widely distributed in the north temperate region of the Old World. By cultivation and blanching the stalks lose their acrid qualities and assume the mild sweetish aromatic taste peculiar to celery as a salad plant. A large number of varieties are cultivated by gardeners, which are ranged under two classes, white and red,—the white varieties being generally the best flavoured and most crisp and tender. Both blanched and green it is stewed and used in soups. In the south of Europe celery is much used in its natural condition.

Celeriac, or turnip-rooted celery (*Apium graveolens* var. *rapaceum*), is a variety cultivated more on account of its roots than for the stalks, although both are edible and are used for salads and in soups. It is chiefly grown in the north of Europe.

CÉLESTE, MADAME (1815–1882), French dancer and actress, was born in Paris on Aug. 16, 1815. As a little girl she was a pupil in the ballet class at the Opéra, and made her début at the Bowery theatre, New York City, at 15. Going to England, she appeared at Liverpool as Fenella in *Masaniello*, and also in London (1831). In 1834 she played to enthusiastic audiences in America. She returned to England in 1837, gave up dancing, and appeared as an actress, first at Drury Lane and then at the Haymarket. In 1844 she joined Benjamin Webster in the management of the Adelphi, and afterwards took the sole management of the Lyceum till 1861. She made a third visit to the United States from 1865 to 1868, and retired in 1870. Her favourite part was Miami in Buckstone's *Green Bushes*. She died in Paris on Feb. 12, 1882.

CELESTIAL MECHANICS. That branch of astronomy known as Celestial Mechanics dates its origin from 1687, the year in which Sir Isaac Newton's epoch-making work *Philosophiæ Naturalis Principia Mathematica* was given to the world.

Law of Gravitation.—Before this date, Kepler's three laws epitomized the mechanics of the planetary system; the laws themselves were simply three independent statements based on the observed facts of the planetary motions. (An account of Kepler's Laws and the definitions of the six "elements" which define a planet's orbit are given in the article ORBIT). To Newton was reserved the supreme achievement of discovering a single all-embracing law—the law of gravitation—of which the three Keplerian laws were deducible consequences.

The foundations of Newton's gravitational discoveries were the three dynamical laws of motion which he set forth at the beginning of the *Principia* and which ever since have borne his name. The first—stated originally by Galileo—asserts that a body will continue to move with uniform velocity in a straight line unless disturbed by some external agency. Now a planet moves round the sun in a nearly circular orbit—the first law of motion requires, therefore, some agency, external to the planet, which prevents the planet going off at a tangent—that is, in a straight line. This agency Newton traced to the sun.

Making use of Kepler's third law, Newton then investigated how the sun's influence varied from planet to planet—he found that it varied inversely as the square of the distances of the planets from the sun. But by Kepler's first law the orbit of any planet is not actually a circle but an ellipse; Kepler's second law showed Newton that the agency maintaining a planet in its orbit must always be directed towards the sun—in other words, the sun exerted an attraction on the planet—and moreover that the magnitude of this attraction varied from point to point of the elliptic

orbit according to the law of the inverse square of the distance. The second law of motion introduced the conception of mass, the amount of matter in a body.

The third law asserted that action and re-action are equal and oppositely directed; in particular if the sun attracts a planet with a certain force, the planet attracts the sun with an equal force. The conclusion that Newton reached was that the force of attraction exerted by the sun on a planet was proportional to the product of the masses of the sun and planet and inversely proportional to the square of the distance between them. But the mass of the sun, for example, is the aggregate of the masses of its individual component particles of matter, and Newton was led to conceive that this power of attraction manifested by the sun was the property of the individual particles.

The famous law of gravitation is then expressed in the form: "Every particle of matter attracts every other particle of matter with a force proportional to the product of the masses of the two particles and inversely proportional to the square of the distance between them." As the sun and planets are spherical (or nearly so), then by a theorem due to Newton the mutual attraction of the sun and any planet is equivalent to the mutual attraction of particles with the masses of the sun and planet supposed concentrated at their respective centres.

The motions of the bodies of the solar system are thus, in the main, to be regarded as the motions of material particles without reference to the dimensions of the bodies themselves. A striking consequence of the universal law of gravitation, to be noted in passing, was the calculation of the masses of planets—which are accompanied by satellites—in terms of the sun's mass regarded as the unit of mass; for example, it is found that the solar mass is 330,000 times the mass of the earth.

The Main Problem.—We approach now the central problem of Celestial Mechanics. In all that has preceded, it has been assumed that the only force acting on a particular planet—let us say Mars—is the gravitational attraction exerted by the sun. But owing to the universality of the law of gravitation, Jupiter and every other planet, together with their satellites, exert each an attraction on Mars which in the case of Jupiter, for example, is proportional to the latter's mass and inversely proportional to the square of the distance between Mars and Jupiter at any given instant. The problem of determining the path of Mars becomes one of tremendous complexity; Mars, as it were, is being tugged by the sun, the planets and their satellites, not by constant amounts and in constant directions, but by varying amounts depending on the changing distances of Mars from these bodies and in directions depending on the ever-altering relative configuration of all the component bodies of the solar system.

The problem is rescued from intractability owing to the preponderating influence of the sun. The mass of the sun is 1,045 times that of Jupiter—the most massive planet,—and it is mainly because of this stupendous disparity in masses that the sun exercises its decisive gravitational influence. The sun controls the destiny of a particular planet, the remaining planets and the satellites can only introduce comparatively slight modifications. It is clear then that Kepler's laws do not represent accurately the motions of the planets, but owing to the insignificance of the planetary masses in comparison with the solar mass they do represent a close approximation to the truth.

A further simplification follows, for the disturbing effects of all planets on the path of Mars for example can, to a high degree of accuracy, be regarded as the sum of effects produced by the individual planets, each moving, not in its true path, but in the Keplerian ellipse to which it closely approximates. The problem then reduces to the investigation of the motion of a planet under the gravitational attraction of the sun and of one other planet.

The section of Celestial Mechanics which deals with the problem just stated is known usually as Planetary Theory. In the same way the motion of a satellite around its primary is approximately an ellipse, and the departures from the elliptic orbit are mainly due to the effect of the sun's gravitational attraction—and that of the other satellites (if any). This section of Celestial Mechanics is known as Satellite Theory and in the special case

of the earth's satellite, the moon, as Lunar Theory. In either case, the problem is the "Problem of three bodies" celebrated since Newton's day as the field of research in which the great mathematical astronomers of the past have found ample scope for their genius.

Planetary Theory.—Let us examine the fundamental problem of Planetary Theory in greater detail. It is required to deduce the path of a planet P under the combined attraction of the sun S and another planet Q. If the influence of the planet Q is disregarded, the path of P relative to the sun can be stated immediately—it is a Keplerian ellipse with which six elements, the semi-major axis, the eccentricity, etc., are definitely associated. If these elements are known, the position of the planet in its orbit and the magnitude and direction of its velocity can be calculated. Conversely, if at any moment the position of the planet and the magnitude and direction of its velocity are known, the six elements of the Keplerian ellipse which it would describe under the gravitational attraction of the sun can be found.

THE PLANETARY THEORY
S represents the sun, and the circles represent the orbits of two planets, P and Q. As the distance between P and Q is continually altering, the attraction of Q on P is also altering, the result being varying disturbances on the orbits of both

Consider now the influence of the planet Q. It also is moving round the sun in a path which, were it not for the effect of the other planets would likewise be a Keplerian ellipse, defined by six elements. At the particular instant at which the configuration of S, P and Q in the figure is represented, the sun's attraction on P is proportional to the sun's mass divided by the square of the distance S P and the attraction of the planet Q is proportional to the mass of Q divided by the square of the distance P Q; owing to the enormous disparity between the mass of the sun and of Q, the latter attraction is only a minute fraction of the solar attraction. Suppose, for a moment, that the attraction of Q on P operates only for an hour. At the end of this time the position of P will be slightly different from the position it would have reached were the planet non-existent and its velocity and direction will also be slightly different. At the end of the hour the planet P will have a definite position and velocity and, as the influence of Q terminates at this moment according to our supposition, P will proceed to describe an elliptic orbit around the sun, the six elements being calculable from the position and velocity of P at the end of the hour. In general, all six elements will be slightly different from the elements of the orbit which was being described by P anterior to the action of Q.

Consider Q to act for another hour; at the end of this time the elliptic elements will again be changed and so the process goes on continuously. The values of the elements can be calculated for any future time by the method devised by Lagrange:—the elliptic orbit to which these elements correspond is clearly the orbit which the planet P would continue to describe were the influence of Q suddenly to cease at the particular future moment considered; this ellipse is called the "osculating ellipse." The changes which the elements undergo owing to the action of the planet Q—the "disturbing" planet—are called "perturbations."

In the way indicated, the perturbations due to the action of each of the remaining planets can be calculated, and so the total effect on the elements of P's orbit obtained. It is to be remarked that the path of P computed from the perturbations obtained in this way, although conforming very much more closely to the true path (which may be supposed known from a series of accurate observations) than to a simple elliptic orbit unaffected by other planets, is yet only an approximation. In order to obtain this approximation, it was assumed amongst other things, that the path of Q was a Keplerian ellipse. But every other planet produces perturbations in Q's motion; when these are calculated the path of Q can therefore be represented more faithfully; and consequently when the motion of P is again considered, the perturbations produced by Q can be more accurately represented. The process of determining the perturbations is carried on then according to the method of successive approximations.

When the final results have been obtained it is found that the expression for an element, such as the eccentricity, consists of a multitude of terms which can be divided into two classes (i) periodic terms (ii) secular terms.

Any single periodic term, which is itself a contribution to the general aggregate of the perturbations of the element, is such that its value lies between a definite maximum and a definite minimum, these and intermediate values being regularly repeated in cycles. Such terms produce no lasting change on the element. A cork floating on the surface of a lake rises and falls rhythmically with the waves—it is sometimes greater and sometimes less than its average distance from the lake bottom, and its motion is periodic. So it is with each of the periodic terms forming part of the perturbations of any given element.

Secular terms on the other hand are of a different kind. The presence of a positive secular term in the expression for the perturbations of the eccentricity means that the eccentricity would go on increasing year by year, century by century. A cork floating down a tidal stream is moving from higher to lower levels, which expressed rather unfamiliarly, means that its distance from the center of the earth is gradually but continuously decreasing—this is precisely the nature of a secular change; but the ebb stream gives way to the flood stream and the cork is carried back to higher reaches of the river, its distance from the centre of the earth now gradually increasing—again in the manner of a secular change. In this way, we can imagine the distance of the cork from the earth's centre to fluctuate between a maximum and a minimum value.

As regards the secular perturbations of the elements there are, first, the truly secular terms which indicate progression in one direction however long into the future we look and, secondly, the secular terms which indicate steady progression for a time, with subsequent reversal—after the manner of the illustration—generally after very long intervals of time. In the first category are the secular perturbations of the longitude of the ascending node—the orbital plane alters in such a way that the node moves progressively around the ecliptic. In the second class are to be found the secular terms defining the progressive changes in the eccentricities of the planets, which if a sufficiently long interval of time is considered remain between certain definite limits of magnitude.

The importance of the secular terms is seen more particularly as regards the perturbations of the semi-major axis. If there are terms which are truly secular in the sense indicated, the average distances of the planets from the sun either increase and continue to increase, in which event the members of the solar system would in the distant future be scattered in space and cease to function as corporate members of a system; or alternatively, the average distances of the planets from the sun would progressively decrease, the final result being their destruction in the solar furnace. The results of planetary theory indicate that no such secular terms appear in the expressions for the perturbations of the semi-major axes—at any rate, up to a very high degree of approximation—from which it may be safely concluded that the stability of the solar system is not prejudiced by the gravitational action and interaction of the planets themselves.

Mention may be briefly made of what are known as the "long period inequalities"; they are due to the approximate commensurability of the mean motions of the two planets concerned. For example, twice the mean motion of Jupiter is nearly equal to five times the mean motion of Saturn, or in other words the orbital periods of Jupiter and Saturn are nearly in the ratio of 5 to 2. The consequence is that certain terms in the perturbations of the elements of Saturn as disturbed by Jupiter, although periodic, have large maximum and minimum values and are consequently of great importance. Their effect, however, operates very slowly—in the case of the two planets mentioned, the period of such changes is 917 years.

Lunar Theory.—The Lunar Theory is a particular aspect of the problem of three bodies, in which the sun acts as the disturbing body on the earth-controlled movements of the moon. The labours of many generations of astronomers have been devoted to the accurate determination of the path of our satellite. The Royal

observatory at Greenwich was founded in 1675, in order that sufficiently accurate Tables of the Moon's position day by day might be available for the urgent problem of the determination of longitude at sea. The largest terms in the perturbations of the moon's motion—which represent the principal deviations from purely elliptic motion—have special names (depending on the way the terms arise); they are—The *Evection*, the *Annual Equation*, the *Variation* and the *Parallactic Inequalities*.

The last word in Lunar Theory is the recently completed "Tables of the Moon" by Professor E. W. Brown in which the gravitational action on the moon's path around the earth of every body in the solar system is fully considered. It might be expected that observation would now confirm theory—in so far as the moon's motion is concerned—with perfect accuracy, but this is not actually so. The beginning and end of a total eclipse of the sun cannot be predicted correctly to a second of time—the error is generally several seconds. It is almost certain that gravitational theory is not to blame for such discrepancies, but that rather there is some influence, minute no doubt in its effect, which is the ultimate cause of our inability to predict accurately the position of the moon in its orbit. Such an influence is believed to be traced to a very slight irregularity in the earth's rotation; if the day, for example, is gradually getting longer the moon will be seen further ahead in its orbit than calculation predicts from gravitational theory alone. As has been said, the discrepancies are extremely minute and the explanation requires further support before it can be satisfyingly complete.

Other Applications.—The history of gravitational astronomy is rich in discoveries which are subsequently made as the result of discrepancies between observation and prediction. The discovery of the planet Neptune is the most notable example. The planet Uranus had been discovered by Sir William Herschel in 1781; the complete machinery of planetary theory was at the service of astronomers to predict its position at any future date. But in the early years of the nineteenth century prediction and observation did not quite agree. Either the Newtonian law of gravitation required modification which was only sensible at the great distance at which Uranus was from the sun or the slightly erratic behaviour of the planet was the consequence of the gravitational attraction of an unknown planet yet more remote. Prof. J. C. Adams and M. Le Verrier both independently adopted the latter hypothesis.

The data of the problem consisted of the minute discrepancies between the observed positions of Uranus each year and the corresponding positions calculated according to the known factors involved. Both astronomers, by different methods and independently, were able to announce that if the practical astronomer pointed his telescope to a certain part of the sky, he would see an object which would prove to be a planet. On the 23rd Sept. 1846, Neptune was discovered telescopically near the position predicted by Adams and Le Verrier.

The minor planets, whose orbits extend from the orbit of Mars to the orbit of Jupiter, present many interesting problems in Celestial Mechanics. There are certain significant gaps in the distribution of the orbits of these small bodies; in round figures, the mean daily motion of Jupiter is 300" and the gaps occur at distances from the sun corresponding to mean motions for example of 600", 750" and 900" (planets with these mean motions would have orbital periods $\frac{1}{2}$, $\frac{2}{3}$ and $\frac{3}{4}$ that of Jupiter). For such planets, if they existed, the principal perturbations due to Jupiter would be "long-period inequalities" similar in character to those found in the case of Jupiter and Saturn. The existence of the gaps has generally been taken to mean that Jupiter's attraction on a minor planet with a mean motion of 600" for example, results in a marked change in the mean motion (and consequently of the mean distance from the sun) and, as it were, sweeps the planet out of the critical orbit (that for which the mean motion is 600"). But whether this is really so or not, Celestial Mechanics has not been able so far to offer an authoritative pronouncement.

An interesting group of minor planets is the "Trojan group," six of which are known. The mean motions of these planets are approximately the same as the mean motion of Jupiter; they are accordingly at approximately the same mean distance from the

sun as Jupiter. Also their distance from Jupiter is approximately equal to their mean distance from the sun. At any moment, then, a Trojan planet, Jupiter and the sun are situated at the vertices of a triangle which is nearly equilateral. Accordingly, the longitude of a Trojan planet is approximately the longitude of Jupiter *plus* 60° (this statement characterizes the situation of four of these bodies) or the Trojan's longitude (as for the two remaining members of the group) is roughly the longitude of Jupiter *minus* 60°. The effect of Jupiter's attraction on any Trojan is, amongst other things, to limit the range of variation of the mean motion; in other words, the extent of the Trojan's orbit varies periodically, being sometimes less and sometimes greater than the orbit of Jupiter. This phenomenon is called "libration." The conclusion is that the orbits of the Trojan planets are "stable"—in contradistinction to the supposed instability of an orbit for which the mean motion, for example, is 600°.

As has been demonstrated in several ways, the magnificent ring-system which makes Saturn unique in the heavens is nothing more than a vast assemblage of small bodies, each in fact a satellite of the planet. The movements of any one of these small bodies are governed by the attraction of Saturn, of the nine satellites and of the remaining myriads of the constituent members of the rings. The two principal rings—Ring A and Ring B—are separated by a gap of about 2,000 miles in breadth called the Cassini division—analogue to the gaps already referred to in the distribution of minor planet orbits. It has been proved that the emptiness of the Cassini Division is due to the perturbing action of the three satellites nearest Saturn—a beautiful application of the principles of Celestial Mechanics.

CELESTIAL SPHERE, the imaginary sphere of indefinite radius on which the positions of the fixed stars are defined by their directions relative to an observer at its centre. The earth's axis meets the celestial sphere in two points, the *celestial poles*. (See *ASTRONOMY: Spherical*.)

CELESTINA, LA, the popular alternative title attached from 1519 (or earlier) to the anonymous *Comedia de Calisto y Melibea*, a Spanish novel in dialogue which was celebrated throughout Europe during the 16th century. The authorship of the *Celestina* and the date of its composition are doubtful. An anonymous prefatory letter in the editions subsequent to 1501 attributes the book to Juan de Mena or Rodrigo Cota, but this ascription is universally rejected. The prevailing opinion is that the author of the 21 acts was Fernando de Rojas, apparently a Spanish Jew resident at the Puebla de Montalban in the province of Toledo; R. Foulché-Delbosc, however, maintains that the original 16 acts are by an unknown writer who had no part in the five supplementary acts. Some scholars give 1483 as the date of composition; others hold that the book was written in 1497. These questions are still unsettled. The *Celestina* excels all earlier Spanish works in tragic force, in impressive conception, and in the realistic rendering of characters drawn from all classes of society. It passed through innumerable editions in Spain, and was the first Spanish book to find acceptance throughout western Europe. A Latin version by Caspar Barth was issued under the title of *Pornoboscodidasculus latinus* (1624) with all the critical apparatus of a recognized classic. James Mabbe's English rendering (1631) is one of the best translations ever published. The original edition of 1499 has been reprinted by R. Foulché-Delbosc in the *Bibliotheca Hispanica*, vol. xii. (1902).

Haebler, "Bemerkungen zur Celestina," in the *Revue hispanique*, vol. ix. pp. 139-170 (1902).

CELESTINE (CAELESTINUS), the name of five popes.

CELESTINE I., pope from 422 to 432. After his triumph over the dissensions caused by the faction of Eulalius (see BONIFACE I.) his episcopate was peaceful. He instructed Cyril, bishop of Alexandria, to inquire into the doctrines of Nestorius. To extir-

pate Pelagianism, he sent to Britain a deacon, Palladius, at whose instigation St. Germanus of Auxerre came to inculcate orthodoxy among the clergy of Britain. Celestine also commissioned Palladius to preach the gospel in Ireland which was beginning to rally to Christianity. Celestine was the first pope who is known to have taken a direct interest in Britain and Ireland.

See Duchesne, *Lib. Pontificalis*, t. 1.

CELESTINE II., pope in 1143–1144. Guido del Castello, born of noble Tuscan family, able and learned, studied under Abelard and became a cardinal priest. He was pope from Sept. 26, 1143 to March 8, 1144. He removed the interdict which Innocent II. had employed against Louis VII. of France.

See A. Certini, *Vita* (Foligno, 1716); Migne, *Patrol. Lat.* 179, 765–820; Jaffé, *Regesta Pontificum Romanorum* (1888), vol. ii., 1 ff.

CELESTINE III. (Giacinto Bobo), pope from 1191 to 1198, once cardinal deacon of Santa Maria in Cosmedin, became pope on March 30, 1191. Henry VI. of Germany forced the pontiff to crown him emperor, and three years later took possession of the Norman kingdom of Sicily; he refused tribute and the oath of allegiance, and even appointed bishops subject to his own jurisdiction; moreover, he gave his brother in fief the estates which had belonged to the countess Matilda of Tuscany. Celestine dared not excommunicate him. In England, Prince John and the barons refused to recognize the papal legate, the bishop of Ely. Richard I. had been set free before the dilatory pope put Leopold of Austria under the ban. He died on Jan. 8, 1198.

See "Epistolae Coelestini III. Papae," in M. Bouquet, *Recueil des historiens des Gaules*, t. 19 (1738 ff.); Migne, *Patrol. Lat.* 206, 867 ff.; further sources in *Neues Archiv für die ältere deutsche Geschichtskunde*, 2. 218; ii., 398 f.; 12. 411–414; Jaffé, *Regesta Pontificum Romanorum* (1888), vol. ii. 577 ff.

CELESTINE IV. (Godfrey Castiglione), pope in 1241, nephew of Urban III. (1185–87), was archpriest and chancellor at Milan, before he joined the Cistercians. In 1227 Gregory IX. created him cardinal priest, and in 1233 cardinal bishop of Sabina. Elected to succeed Gregory on Oct. 25, 1241, he died on Nov. 10 before consecration.

See A. Potthast, *Regesta Pontificum Romanorum*, vol. i. (1874), 940 f.

CELESTINE V. (St. Peter Celestine), pope in 1294, was born of poor parents at Isernia about 1215, and became a Benedictine. Living as a hermit he attracted other ascetics whom he organized into a congregation of the Benedictines which was later called the Celestines (*q.v.*). His *Opuscula* (Naples, 1640) are probably not genuine. A fight between the Colonna and the Orsini, as well as dissensions among the cardinals, prevented a papal election for over two years after the death of Nicholas IV. Finally, Celestine was elected on July 5, 1294. Apocalyptic notions then current doubtless aided his election, for Joachim of Floris and his school looked to monasticism to deliver the church and the world. Multitudes came to Celestine's coronation and he began his reign the idol of visionaries, of extremists and of the populace. But the pope was in the power of Charles II. of Naples, and became his tool against Aragon. When he wished to abdicate, Benedetto Gaetano, destined to succeed him as Boniface VIII., removed all scruples against this unheard of procedure by finding a precedent in the case of Clement I. Celestine abdicated on Dec. 13, 1294, and died in a monastic cell in the castle of Fumone on May 19, 1296. He was canonized by Clement V. in 1313.

See Herzog-Hauck, *Realencyklopädie*; Jean Aurélien, *La Vie admirable de . . . Saint Pierre Celestin* (Bar-le-Duc, 1873); H. Finke, *Aus den Tagen Bonifaz VIII.* (Münster, 1902).

CELESTINE or **CELESTITE**, a name applied to native strontium sulphate (SrSO_4), having been suggested by the celestial blue colour which it occasionally presents. It is usually colourless, or has only a delicate shade of blue. It crystallizes in the orthorhombic system, being isomorphous with barytes (*q.v.*). The cleavage is a perfect parallel to the basal pinacoid, and a less marked parallel to the prism. Although celestine much resembles barytes in its physical properties, having for example the same hardness (3), it is less dense, its specific gravity being 3.9. It is less abundant than barytes, but is, however, much more soluble.

Celestine occurs in the Triassic rocks of Britain, especially in veins and geodes in the Keuper marl in the neighbourhood of Bristol. At Wickwar and Yate in Gloucestershire it is worked for industrial purposes. Colourless crystals of great beauty occur in association with calcite and native sulphur in the sulphur deposits of Sicily, as at Girgenti. Very large tabular crystals are found in limestone on Strontian island in Lake Erie; and a blue fibrous variety from near Frankstown, Blair county, Pa., is notable as having been the original celestine on which the species was founded by A. G. Werner in 1798.

Celestine is much used for the preparation of strontium hydrate, which is employed in refining beetroot sugar. (F. W. R.)

CELESTINES, a religious order founded about 1260 by Peter of Morrone, afterwards Pope Celestine V. (1294). It was an attempt to unite the eremitical and cenobitical modes of life. Peter's first disciples lived as hermits on Mount Majella in the Abruzzi. The Benedictine rule was taken as the basis of the life, but was supplemented by regulations notably increasing the austerities practised. The form of government was borrowed largely from those prevailing in the mendicant orders. Indeed, though the Celestines are reckoned as a branch of the Benedictines, there is little in common between them. During the founder's lifetime the order spread rapidly, and eventually there were about 150 monasteries in Italy, and others in France, Bohemia and the Netherlands. The French houses formed a separate congregation, the head-house being in Paris. The French Revolution and those of the 19th century destroyed their houses, and the Celestine order seems no longer to exist.

See Helyot, *Histoire des ordres religieux* (1792), vi. c. 23; Max Heimbucher, *Orden und Kongregationen* (1896), i. § 22, p. 134; the art. "Cölestiner" in Wetzer und Welte, *Kirchenlexicon* (ed. 2), Herzog-Hauck, *Realencyklopädie* (ed. 3) and *Catholic Encyclopedia*, vol. xvi. pp. 19, 20.

CELIBACY (Lat. *caelibatus*, from *caelebs*, unmarried), the state of being unmarried, a term now commonly used in the sense of complete abstinence from marriage; it originally included the state of widowhood also, and anyone was strictly a *caelebs* who had no existing spouse. From the point of view of public utility, the State has sometimes attempted to discourage celibacy. Ecclesiastical legislators, on the other hand, have frequently favoured the unmarried state; and celibacy, partial or complete, has been more or less stringently enforced upon the ministers of different religions; many instances are quoted by H. C. Lea. The best known, of course, are the Roman vestals; though even the great honours and privileges accorded to these maidens were often insufficient to keep the ranks filled. In the East, however, this and other forms of asceticism have always flourished more freely; and the Buddhist monastic system is not only far older than that of Christendom, but also proportionately more extensive. In early Judaism all priests were the sons of priests, and the case of Elizabeth shows that here, as throughout the Jewish people, barrenness was considered a disgrace. But Alexander's conquests brought the Jews into contact with Hindu and Greek mysticism, and this probably explains the growth of the ascetic Essenes some two centuries before the Christian era. The adherents of this sect, unlike the Pharisees and Sadducees, were never denounced by Christ, who on the contrary had real sympathy with the voluntary celibacy of an exceptional few (Matt. xix. 12). St. Paul's utterances on this subject amount only to the assertion that a struggling missionary body will find more freedom in its work in the absence of wives and children. At the same time St. Paul claimed emphatically for himself and the other apostles the "power to lead about a wife"; and he names among the qualifications for a bishop, an elder, and a deacon that he should be "the husband of one wife." Indeed it was admitted by the most learned men of the middle ages that celibacy had been no apostolic rule; and though writers of ability have attempted to maintain the contrary even in modern times their contentions are unhesitatingly rejected by the best Roman Catholic scholars.¹

Growth of Clerical Celibacy.—The gradual growth of clerical celibacy, first as a custom and then as a rule, can be traced

¹ I. Cor. vii. 25 seq., ix. 5; I. Tim. iii. 2, 11, 12; Titus i. 6; E. Vacandard in *Dict. de Théol. Cath.*, s.v. "Célibat."

through the scanty records of the first few centuries. The most ascetic Christians began to question the legality of second marriages on the part of either sex; yet twice-married men (*digami*) were admitted to the priesthood by Pope Calixtus I. (219-222), and even as late as the beginning of the 5th century we find husbands of widows consecrated to the episcopate. The so-called apostolical constitutions and canons, the latter of which were compiled in the 4th century, give us the first clear and fairly general rules on the subject. Here we find "bishops and priests allowed to retain the wives whom they may have had before ordination, but not to marry in orders; the lower grades, deacons, subdeacons, etc., allowed to marry after entering the church; but all were to be husbands of but one wife, who must be neither a widow, a divorced woman, nor a concubine" (Lea i. 28). Many causes, however, were already at work to carry public feeling beyond this stage. Quite apart from the few enthusiasts who would have given a literal interpretation to the text in Matt. xix. 12, vows of virginity became more and more frequent; these were at first purely voluntary and temporary; but public opinion naturally grew less and less tolerant of an unstable purpose. Again, not only was the church doctrine itself more or less consciously influenced by the Manichaean tenet of the diabolical origin of all matter, including the human body, but churchmen were also naturally tempted to compete in asceticism with the many heretics who held this tenet. Moreover, in proportion as the clergy became beneficiaries and administrators of rich endowments, a strong feeling grew up among the laity that church revenues should not go to support the priest's family. Lastly the partial attempts at enforcement, by their very failure, suggested more heroic measures. Therefore, side by side with the evidence for breach of the old rules, we find an equally constant series of new and more stringent enactments.

Synod of Elvira.—The first church council which definitely forbade marriage to the higher clergy was the local Spanish synod of Elvira (A.D. 305). The 4th century opened a wide breach in this respect between the Eastern and Western churches. The modern Greek custom is "(a) that most candidates for holy orders are dismissed from the episcopal seminaries shortly before being ordained deacons, in order that they may marry (their partners being in fact mostly daughters of clergymen), and after their marriage return to the seminaries in order to take the higher orders; (b) that, as priests, they still continue the marriages thus contracted, but may not remarry on the death of their wives; and (c) that the Greek bishops, who may not continue their married life, are commonly not chosen out of the ranks of the married secular clergy, but from among the monks."¹ The Eastern Church, therefore, still adheres fairly closely to the apostolical canons. In the West, however, a decisive step was taken by Popes Damasus and Siricius during the last quarter of that century. The famous decretal of Siricius (385) not only enjoined strict celibacy on bishops, priests, and deacons but insisted on the separation of those who had already married, and prescribed expulsion for disobedience (Siric. *Ep.* i. c. 7; Migne, *P.L.* xiii. col. 1138). Leo the Great (d. 461) and Gregory the Great (d. 604) further extended the rule of celibacy to subdeacons.

For the next three or four centuries there is little to note but the continual open or secret resistance to these decrees and the parallel frequency and stringency of legislation, which by its very monotony bears witness to its want of success. In many districts the priesthood tended to become a mere hereditary caste, to the disadvantage of Church and State alike. In spite of Dunstan's reforms at the end of the 10th century, the Norman Lanfranc found so many wedded priests that he dared not decree their separation; and when St. Anselm attempted to go further, this seemed a perilous novelty even to so distinguished an ecclesiastic as Henry of Huntingdon, who records that many feared "lest the clergy, in striving after a purity too great for human strength, should fall into horrible impurity, to the extreme dishonour of the Christian name" (lib. vii.; Migne, *P.L.* cxcv. col. 944). Yet this was at a time when the decisive and continued action of the papacy ought to have left no possible doubt as to the law of the church.

¹Hefele, *Beiträge zur Kirchengesch. u.s.w.* i. 139.

Reforms of Hildebrand.—For, under the influence of St. Peter Damiani and Hildebrand, five successive popes between 1045 and 1073 had attempted a radical reform; and when, in this latter year, Hildebrand himself became pope, he took measures so stringent that he has sometimes been erroneously represented as the actual author of the strict rule of celibacy. His mind, strongly imbued with the theocratic ideal, saw more clearly than any other the enormous increase of influence which would accrue to a strictly celibate body of clergy; and no statesman has ever pursued with greater energy and resolution a plan once formulated. In order to break down the desperate resistance of the clergy, he did not shrink from the perilous course of subjecting them to the judgment of the laity. Not only were concubinary priests—a term which was now made to include also those who had openly married—forbidden to serve at the altar and threatened with actual deposition, but the laity were warned against attending mass said by "any priest certainly known to keep a concubine or *subintroducta*."¹

But these heroic measures soon caused serious embarrassment. If the laity were to stand aloof from all incontinent priests, while (as the most orthodox churchmen constantly complained) many priests were steadily incontinent, then this could only result in estranging large bodies of the laity from the sacraments. It became necessary, therefore, to soften a policy which might imply that the virtue of a sacrament was weakened by the vices of its ministers. Therefore, though Peter Lombard (d. 1160) had concluded that no excommunicated priest can effect transubstantiation, St. Thomas Aquinas (d. 1274) agrees with all the later schoolmen in granting him that power, though to the peril of his own soul.² For, by the last quarter of the 13th century, the struggle had entered upon a new phase. The severest measures had been tried, especially against the priests' unhappy partners. As early as the council of Augsburg (952) these women were condemned to be scourged, while Leo II. and Urban II., at the councils of Rome and Amalfi (1051, 1089), adjudged them to actual slavery. Such enactments naturally defeated their own purpose. More was done by the gentler missionary zeal of the Franciscans and Dominicans in the early 13th century; but St. Thomas Aquinas had seen half a century of that reform and had recognized its limitations; he therefore attenuated as much as possible the decree of Nicholas II. Alvarez Pelayo, a Spanish bishop and papal penitentiary, wrote in 1332: "The clergy sin commonly in these following ways . . . fourthly, in that they live very incontinently, and would that they had never promised continence, especially in Spain and Southern Italy, in which provinces the sons of the laity are scarcely more numerous than those of the clergy." Cardinal Pierre d'Ailly pleaded before the Council of Constance in 1415 for the reform of "that most scandalous custom, or rather abuse, whereby many (clergy) fear not to keep concubines in public."³

Suppression of Open Marriages Among Clergy.—Meanwhile, open marriages among clergy in holy orders (priests, deacons, and subdeacons) were gradually stamped out. A series of synods, from the early 12th century onwards, declared such marriages to be not only unlawful, but null and void in themselves. Yet the custom lingered sporadically in Germany and England until the last few years of the 13th century, though it seems to have died out earlier in France and Italy. There was also a short-lived attempt to declare that even a clerk in lower orders should lose his clerical privileges on his marriage; moreover, a bishop's licence was required to enable the cleric to officiate in church, and the episcopal registers show that the diocesans frequently insisted on the celibacy of parish clerks. As the middle ages drew to a close earnest churchmen were compelled to ask themselves whether it would not be better to let the priests marry than to continue a

¹The actual originator of this policy was Nicholas II., probably at Hildebrand's suggestion; but the decree remained practically a dead letter until Gregory's accession.

²Peter Lombard, *Sentent.* lib. iv. dist. 13; Aquinas, *Summa Theol.* pars iii. Q. lxxxiii. art. 7, 9.

³Alvarus Pelagius, *De Planctu Ecclesiae*, ed. 1517, f. 131a, col. 2; cf. f. 102b, col. 2; Hermann von der Hardt, *Constantiensis Concilii*, etc. vol. i. pars. viii. col. 428.

system under which concubinage was even licensed in some districts.¹

Proposals to Reintroduce Clerical Marriage.—Serious proposals were made to reintroduce clerical marriage at the great reforming councils of Constance (1415) and Basle (1432); but the overwhelming majority of orthodox churchmen were unwilling to abandon a rule for which the saints had fought during so many centuries, and to which many of them probably attributed an apostolic origin. This conservative attitude was inevitably strengthened by the attacks first of Lollard and then of Lutheran heretics; and Sir Thomas More was driven to declare that the marriage of priests, being essentially null and void, "defileth the priest more than double or treble whoredom." Yet the frequency of concubinage moved the emperor Charles V. to obtain from Paul III. dispensations for married priests in his dominions; and his successor Ferdinand, with the equally catholic sovereigns of France, Bavaria, and Poland, pleaded strongly at the Council of Trent (1545) for permissive marriage. The council, after some hesitation, took the contrary course, and erected sacerdotal celibacy practically, if not formally, into an article of faith. In spite of this, the emperor, Joseph II., re-opened the question in 1783. In France the revolutionary constitution of 1791 abolished all restrictions on marriage, and during The Terror celibacy often exposed a priest to suspicion; but the better part of the clergy steadily resisted, and it is estimated that only about 2% were married. The Old Catholics adopted the principle of sacerdotal marriage in 1875.

Celibacy in Modern Times.—The modern working of the system is a controversial question; but four points may be noted on which most writers would probably agree. The Roman Catholic clergy have owed much of their influence to celibacy, and in many cases this influence has been justly earned by the celibate's devotion to an unworldly ideal. Again, the most adverse critics would admit that much was done by the counter-reformation, and that modern ecclesiastical discipline on this point is considerably superior to that of the middle ages; while, on the other hand, many authorities of undoubted orthodoxy are ready to confess that it is not free from serious risks even in these days of easy publicity and stringent civil discipline.² Lastly, statistical research has shown that the children of the married British clergy have been distinguished far beyond their mere numerical proportion.³

BIBLIOGRAPHY.—H. C. Lea, *Hist. of Sacerdotal Celibacy* (1907), is by far the fullest and best work on this subject, though a good deal of important matter omitted by Dr. Lea may be found in *Die Einführung der erzwungenen Ehelosigkeit* by the brothers Johann Anton and Augustin Theiner, which was put on the Roman Index, though Augustin afterwards became archivist at the Vatican (1828). The evidence as to monastic celibacy is treated with some fulness in vol. ii. of G. G. Coulton, *Five Centuries of Religion* (1927); the most important evidence of the episcopal registers is either still in ms. or has been only recently published. The most learned work from the strictly conservative point of view is that of F. A. Zaccaria, *Storia Polemica del celibato sacro* (1774); but many of his most important conclusions are set aside by the abbé E. Vacandard. (*Dict. de théol. cath.* vol. ii. art. "Célibat ecclésiastique.") (G. G. C.)

CELINA, an incorporated village in western Ohio, U.S.A., on Grand reservoir (or Lake St. Marys); the county seat of Mer-

cer county. It is served by the Big Four, the Nickel Plate and the Western Ohio (electric) railways. Pop. in 1930, 4,664. Celina is a summer resort, the commercial centre of a farming region and an important furniture-manufacturing town. Stearic acid and phonographs are also manufactured. The village was settled in 1834 and incorporated in 1885. Grand reservoir is an artificial lake, 9m. long by 3m. wide, built to feed the old Miami and Erie canal.

CELL, originally a small detached room in a building (Lat. *cella*, a small room), particularly a small monastic house (see *ABBEY*). Also used for the small sleeping apartments of the monks, or the small dwelling of a hermit. This use still survives in the small separate chambers in a prison (*q.v.*). The word also denotes various small compartments which build up a compound structure, such as honeycomb, etc.

In electricity a cell may be defined as a system which produces electromotive force by chemical action; for voltaic, dry and concentration cells see *BATTERY*, and *ELECTROLYSIS*; *Voltaic Cells*; for secondary cell see *ACCUMULATOR*; for gas cell see *HYDROGEN ION CONCENTRATION*; for standard cell see *INSTRUMENTS, ELECTRICAL*.

In biology the term cell denotes microscopic structural elements which form the bulk of the tissues of animals and plants of visible dimensions. The precise meaning of the term cell in biological literature is set forth in the article *CYTOLOGY* (*q.v.*). When the term came into usage in biology, it referred to the smallest units of structure that the microscope could reveal in the animal or plant body. First used by Robert Hooke (1665) for the minute cavities of cork, a tissue which he described as made up of "little boxes or cells," it is a survival from the microscopic descriptions of plant structure made by 17th century botanists, and as such is really a misnomer, for tissues of animals rarely display the honeycomb-like appearance of pith, cork, etc., when examined microscopically. To-day the cell is recognized to be a complex, consisting of a number of well-defined structures (*nucleus, mitochondria*, etc.) so that it is no longer possible to define the cell as the ultimate structural unit of living matter. On the other hand, it is a physiological unit. It is the delimitation of this characteristic complex of microscopically visible units by a boundary which possesses the physical property of differential permeability to different kinds of molecules that characterizes the individual cell, which has thus come to be regarded as a unit of physiological activity of a certain order. The fact that the respective contributions of the maternal and paternal parents to the physical constitution of the offspring are derived in each case from a single cell of the parent-body has revolutionized the study of heredity; and has stimulated a considerable body of research which makes it possible to-day to envisage the structural basis of hereditary transmission and the determination of sex. Thus the Cell Doctrine, *i.e.*, the

recognition of the cell originally as the structural unit of the body and later as a unit of physiological activity, has exerted its influence on every department of biological thought since it was formulated by Schleiden and Schwann in 1839. (L. T. H.)

CELLA, in architecture, the Latin name for the enclosed portion of a Roman temple, corresponding with the naos of the Greek temple, or any similar structure, whether of a temple or other building.

BY COURTESY OF THE METROPOLITAN MUSEUM OF ART
A DUNCAN PHYFE CELLARET OF THE 19TH CENTURY. MOUNTED WITH CLAW FEET

CELLARET (*i.e.*, little cellar), strictly that portion of a sideboard which is used for holding bottles and decanters. Sometimes it is a drawer, divided into compartments lined with zinc, and sometimes a cupboard, but still an integral part of the sideboard. In the latter part of the 18th century, when the sideboard was in process of evolution from a side-table with drawers into the large and important piece of furniture which it eventually be-

¹This more or less regular sale of licences by bishops and archdeacons flourished from the days of Gregory VII. to the 16th century; see index to Lea, *s.v.*, "Licences." Dr. Lea has, however, omitted the most striking authority of all. Gascoigne, the most distinguished Oxford chancellor of his day, writing about 1450 of the Bishop of St. David's, says that he had refused to separate the clergy of his diocese from their concubines, giving publicly as his reason, "for then I, your bishop, should lose the 400 marks which I receive yearly in my diocese for the priests' lemans" (Gascoigne, *Lib. Ver.* ed. Rogers, p. 36). Even Sir Thomas More, in his polemic against the Reformers, admitted that this concubinage was too often tolerated in Wales (*English Works*, ed. 1557, p. 231, cf. 619).

²Lea (ii. 339 ff.) gives a long series of quotations to this effect from church synods and orthodox disciplinary writers of modern times.

³Havelock Ellis, *A Study of British Genius*, p. 80 (London, 1904), "Even if we compare the Church with the other professions with which it is most usually classed, we find that the eminent children of the clergy considerably outnumber those of lawyers, doctors, and army officers put together." Mr. Ellis points out, however, that "the clerical profession . . . also produces more idiots than any other class."

came, the cellaret was a detached receptacle. It was most commonly of mahogany or rosewood, many-sided or even octagonal, and occasionally oval, bound with broad bands of brass and lined with zinc partitions to hold the ice for cooling wine. Sometimes a tap was fixed in the lower part for drawing off the water from the melted ice. Cellarets were usually placed under the sideboard, and were, as a rule, handsome and well-proportioned; but as the artistic impulse which created the great 18th-century English school of furniture died away, their form grew debased, and under the influence of the British Empire fashion, which drew its inspiration from a bastard classicism, they assumed the shape of sarcophagi incongruously mounted with lions' heads and claw-feet. Hepplewhite called them *garde du vin*; they are now nearly always known as "wine-coolers."

CELLE, a town of Germany, in the Prussian province of Hanover, on the left bank of the navigable Aller, near its junction with the Fuse and the Lachte, 23 m. N.E. of Hanover. Pop. (1925) 25,467. Founded in 1292, the town was the residence of the dukes of Lüneburg-Celle, a cadet branch of the ducal house of Brunswick, from the 14th century until 1705. The most interesting building is the former ducal palace, begun in 1485 in Late Gothic style, but with extensive Renaissance additions of the late 17th century. There are manufactures of biscuits, umbrellas, leather, sugar, dyes and paper, and trade is carried on in wax and timber. Celle is the seat of the court of appeal from the superior courts of Aurich, Detmold, Göttingen, Hanover, Hildesheim, Lüneburg, Osnabrück, Stade and Verden.

CELLIER, ALFRED (1844-1891), English composer of light operas of which one, "Dorothy," enjoyed prodigious popularity, running from Sept. 25, 1886, till April 1889. "The Mountebanks," to a libretto by W. S. Gilbert, was also very successful.

CELLINI, BENVENUTO (1500-1571), Italian artist, metal worker and sculptor, born in Florence on Nov. 1, 1500. His father was a musician and artificer of musical instruments, who married Maria Lisabetta Granacci, and 18 years elapsed before they had any children. Benvenuto (meaning "welcome") was the third child. The father destined him for his own profession and tried to thwart his inclination for design and metal work. At 15, however, he was apprenticed to a goldsmith, Antonio di Sandro, named Marcone. He had already attracted some notice in Florence when, being implicated in a brawl, he was banished to Siena where he worked for Francesco Castoro, a goldsmith. He visited Bologna and Pisa, and returned to Florence before he went to Rome in 1519. To this period belong a silver casket, some silver candlesticks, a vase for the bishop of Salamanca, and the gold medallion of "Leda and the Swan"—the head and torso of Leda cut in hard stone—executed for Gonfaloniere Gabbriello Cesarino, which is now in the Vienna museum. In the attack upon Rome (1527) by the constable de Bourbon, the bravery of Cellini proved of signal service to Pope Clement VII.; if we may believe his own accounts, his was the hand which shot the Bourbon dead, and he afterwards killed Philibert, prince of Orange. His exploits paved the way for a reconciliation with the Florentine magistrates and his return to Florence. Here he worked on medals, the most famous of which are "Hercules and the Nemean Lion," in gold repoussé work, and "Atlas supporting the Sphere," in chased gold. From Florence he went to the court of the duke of Mantua, and thence again to Rome, where he was employed in the working of jewellery and the execution of dies for private medals and for the papal mint. Here, in 1529, he avenged a brother's death by slaying the slayer; soon afterwards he had to flee to Naples to shelter himself from the consequences of an affray with a notary, Ser Benedetto, whom he wounded, but on the accession of Paul III. he was reinstated. The plots of Pierluigi Farnese, a natural son of Paul III., led to his retreat from Rome to Florence and Venice, and once more he was restored with greater honour than before.

On returning from a visit to the court of Francis I., being now aged 37, he was imprisoned for some time on a charge (apparently false) of having embezzled during the war the gems of the pontifical tiara. At last, however, he was released at the intercession of Pierluigi's wife, and more especially of the Cardinal d'Este of Ferrara. For a while after this he worked at the court of

Francis I. at Fontainebleau and in Paris. But the enmity of the duchesse d'Etampes and the intrigues of the king's favourites led him, after about five years of laborious and sumptuous work, to retire in 1545 in disgust to Florence. During the war with Siena, Cellini was appointed to strengthen the defences of his native city. He died in Florence on Feb. 14, 1571, unmarried, and was buried in the church of the Annunziata.

Besides the works in gold and silver which have been mentioned, Cellini executed several pieces of sculpture. The most distinguished is the bronze group of "Perseus holding the head of Medusa," now in the Loggia dei Lanzi at Florence, one of the most typical monuments of the Italian Renaissance.

Not less characteristic of its splendidly gifted and barbarically untameable author are his autobiographical memoirs begun in Florence in 1558—a production of the utmost energy, directness, and racy animation, setting forth one of the most singular careers in all the annals of fine art. His amours and hatreds, his passions and delights, his love of the sumptuous and the exquisite in art, his self-applause and self-assertion, make this one of the most singular and fascinating books in existence. The original manuscript is at the Laurenziana in Florence. Cellini also wrote treatises on the goldsmith's art, on sculpture, and on design (translated by C. R. Ashbee, 1899).

Among his works of art, many of which have perished, were a colossal Mars for a fountain at Fontainebleau and the bronzes of the doorway, coins for the papal and Florentine states, a Jupiter in silver of life size, and a bronze bust of Bindo Altoviti. His other works in existence to-day are the celebrated salt-cellar made for Francis I. at Vienna; a medallion of Clement VII. in commemoration of the peace between the Christian princes, 1530, signed with the artist's name; a medal of Francis I. with his portrait, also signed; and a medal of Cardinal Pietro Bembo. Cellini, while employed at the papal mint at Rome during the papacy of Clement VII. and later of Paul III., executed the dies of several coins and medals, some of which still survive. He also executed in 1535 for Alessandro de' Medici, first duke of Florence, a 40-soldi piece, with a bust of the duke on one side and standing figures of the saints Cosmo and Damian on the other.

The important works which have perished include the uncompleted chalice intended for Clement VII.; a gold cover for a prayer-book as a gift from Pope Paul III. to Charles V.; large silver statues of Jupiter, Vulcan, and Mars, wrought for Francis I. during his sojourn in Paris; a bust of Julius Caesar; and a silver cup for the cardinal of Ferrara. The magnificent gold "button," or morse, made by Cellini for the cope of Clement VII., appears to have been sacrificed by Pius VI., in furnishing the indemnity of 30,000,000 francs demanded by Napoleon in 1797. Fortunately there are in the print room of the British Museum three water-colour drawings of this splendid morse done by F. Bertoli in the first half of the 18th century.

BIBLIOGRAPHY.—Cellini's autobiography was published by O. Bacci (1900). English translations by J. A. Symonds, Thomas Roscoe, A. Macdonnell and R. H. Cust. CELLULOID. This artificial substance, known also as artificial ivory and xylonite, is a compressed, solid solution of nitrated cellulose in camphor or a camphor substitute. It is colourless or slightly yellow, transparent in thin sheets, and capable of being stained with the most delicate colours, which permeate its entire mass. Celluloid is of uniform composition and its specific gravity is about 1.35; it is insoluble in water or dilute acid, usually emits a faint smell of camphor and is inflammable.

Celluloid becomes plastic when immersed in water at or near

boiling-point and can then be moulded into any desired form. At ordinary temperatures it can be cut, turned, sawn, drilled and otherwise worked to form numerous useful and ornamental articles. Having a tensile strength of 10,000–12,000 lb. per sq. in., it is one of the strongest of artificial materials. Celluloid is elastic, and can be produced in very thin sheets and films; celluloid films 0.000039 ($\frac{1}{255,100}$) in. thick were made in 1924 by the U.S. Bureau of Standards, for use in X-ray researches.

The solubility of nitrated cellulose in camphor is the important property on which the success of making ordinary celluloid depends. Tissue paper, cotton, wood or other cellulose material is nitrated by means of a mixture of strong nitric and sulphuric acids. The product, which is of the nature of, but less highly nitrated than, gun-cotton, is bleached, washed and dried; it is then incorporated in a mixing-machine, with natural or synthetic camphor and volatile solvents. At this stage softeners, e.g., oils, colouring matter and filling material, selected according to the kind of celluloid required, may be added. The gelatinous mass obtained is transferred to heated adjustable rollers by which it is kneaded and rolled into sheets of any desired thickness. After removal from the rollers, the sheets are pressed and dried or seasoned to eliminate the volatile solvents.

Numerous modifications of the process thus briefly described have been proposed, some having for their objects the production of so-called "non-inflammable celluloid" and the use of a substitute for camphor, the price of which is usually high.

Making Celluloid Safe.—The attempts to make a celluloid which is less inflammable than ordinary celluloid have been to some extent successful. To achieve this result, a chloride has been added to the celluloid-making materials, or a bromate or other substance capable of liberating flame-extinguishing gases, or the celluloid mass has been very highly compressed. Acetyl cellulose or cellulose ethers have also been used instead of the nitrated cellulose; this use, however, leads to a consideration of processes, outside the scope of this article, in which acetyl cellulose, cellulose ethers, and synthetic resins and not nitrated cellulose are used.

There have been very many attempts, mostly unsuccessful, to obtain a suitable camphor substitute. The most commonly used substitutes for camphor are the cresyl phosphates dibutylphthalate; these also render the celluloid less inflammable. Recently celluloid manufacture has been very much modified. Celluloid is precipitated, in the form of powder, by gradually adding water to its solutions. After separation, the powder is dried, filled into moulds and heated until plastic under pressure. Such processes have the advantage of considerably shortening the seasoning step and facilitating addition of colouring matter.

The term celluloid was first applied by Messrs. J. W. and I. S. Hyatt, who began the manufacture of the material in the United States in 1869. Their work was based on that of A. Parkes and D. Spill, who, in 1855 and 1868 respectively, succeeded in England in making similar plastic materials. The advance of J. W. and I. S. Hyatt was due to their investigations into the action of camphor upon cellulose and to their improved mechanical methods. The industry has become established in the United States, Great Britain, France, Germany, Austria, Switzerland and Japan.

Not only ivory but also horn, tortoise-shell, amber, agate, ebony and many other natural substances may be imitated by means of celluloid, and it is used in making numerous useful and ornamental articles. These include cutlery handles, billiard balls, collars, automobile windows, piano keys, buttons, combs, brush and mirror backs, fancy boxes, dolls, hollow balls and other toys, dental plates, accumulator cases, telephone mouthpieces, transparent screens and parts of drawing and optical instruments. During the War the demand for celluloid articles such as accumulator cases and transparent screens, was great.

In obtaining irregular colour effects in celluloid, e.g., for producing imitation tortoise-shell, colouring matters are dropped very carefully and in small quantities upon a sheet of celluloid before seasoning, as the sheet passes between rollers; the colouring matter sinks into the sheet.

See F. Boeckmann, *Celluloid* (1921); H. H. Hodgson, *Celluloid* (1925). (T. E. L.)

CELLULOSE. The main ingredient of the membranous cell walls of plants, which in the more advanced stages of development assume elongated shapes and become tubular and fibrous. In the plant structure cellulose is always accompanied by other substances in intimate association, as incrustants, from which it can be freed by various methods. Cellulose of high purity is easily prepared from cotton, the seed hair of *Gossypium*, by prolonged boiling of the raw material with 1% solution of sodium hydroxide, subsequent treatment with dilute acetic acid and repeated washing with distilled water: its analysis will then be about 99.8% of cellulose and 0.05% of ash. Cellulose obtained in this sort of way is regarded as standard cellulose. Chemical filter paper is practically pure cellulose, especially when it has received an exhaustive treatment with hydrochloric and hydrofluoric acids for removal of ash, which is partly siliceous. Standard cotton cellulose is white, fibrous and of characteristic form and appearance: other pure fibrous celluloses, e.g., bleached flax, hemp, ramie, wood-cellulose, are equally characterized in form and appearance. Commonly it absorbs 6–8% of moisture in contact with the air, which is given off again by drying at 100–105°C.: it appears that it gives up water more slowly than it absorbs it. When dry, cellulose is a good electrical insulator with specific inductive capacity about 7. The specific gravity of cellulose is about 1.58 and depends on its source and on its state or condition (woods, containing 40–80% of air, have an apparent specific gravity about 0.3–1.3). W. N. Hartley (1893) and S. Judd Lewis (1918–24) have shown that cellulose is strongly fluorescent to much of the ultra-violet spectrum; it appears that constituent groups within the cellulose molecule affect the fluorescent properties, as indicated by distortion of the characteristic frequency curve, so that it may be possible, eventually, to use this method in the determination of questions of constitution.

The properties of cellulose depend to a considerable extent on its state or condition. Thus, whereas cotton cellulose will absorb about 7% of moisture from the air, regenerated cellulose, such as artificial silk, will absorb similarly about 10% and so on; the general experience being that almost any sort of pre-treatment tends to make some portion at least of the cellulose more reactive, and this effect is not reversible.

Comparison of Celluloses.—From cellulosic raw materials, celluloses can be separated by a variety of methods, some of which are of great industrial importance. The celluloses thus separated have properties that are not identical with those of standard cotton cellulose. The cotton cellulose is, for example, relatively more resistant to the action of acids (hydrolysis) and alkalis than are other celluloses. The less resistant portions of the celluloses are termed hemicelluloses. Whether or not the more resistant, less soluble residual portions of these celluloses are identical with the resistant cellulose of cotton is a difficult question, not yet finally answered, on which recent methods of investigation by X-ray analysis have given valuable information. Something of the nature of the difficulties underlying this kind of enquiry will be appreciated from the following considerations. Classical chemistry has achieved its successes largely by analytic and synthetic methods of re-arranging atoms and molecules in fluid media (gases, liquids, solutions). The systematic principles guiding these methods have had to be derived, until comparatively recently, almost entirely from the study of fluid systems; and thus it happened that very little was known about the fundamental internal arrangements and groupings of atoms and molecules, inside solids. But the study of the colloidal state has shown that the properties of substances and the qualities of materials are related not merely to fundamental arrangements and groupings of their atoms and molecules but also, in turn, to the higher aggregation of these fundamental units into particles, micelles, crystallites or whatever they may be called. X-ray analysis has shown, further, that a substance like sodium chloride, consisting of separate NaCl molecules in solution, is when *in situ* in the crystal, an aggregate of linked, alternate Na and Cl atoms arranged in lines and planes, in orderly sequence: so that the whole crystal is really a single, ordered aggregate of atoms and its properties and qualities are related to that state or condition of aggregation.

The chemistry of cellulose has been derived, of necessity, very largely from the study of its reactions to reagents which, of course, affect the state or condition of aggregation and it is probable that it has never been possible to reverse chemical treatment to the full extent of restoring the cellulose to the state or condition of aggregation in which the plant formed it originally, and upon which its qualities and properties as cellulose material depend. When, therefore, celluloses derived from different sources by different methods behave differently, *e.g.*, towards acids or alkalis as already recorded, it may be either that they are not one and the same sort of cellulose or that if they are the same then their state of aggregation may be not the same. X-ray analysis has given some information on this problem though much remains to be done before its conclusions can be accepted with finality. The method depends upon the diffraction of X-rays by the planes of the atoms. By ingenious arrangements the diffracted rays are registered photographically on a film as a series of parallel lines of varying intensity and characteristic pattern. The method shows that the cellulose aggregates consist of crystallites: their arrangement in crystalline form is the same for cotton, ramie and wood. The artificial silks, excepting cellulose acetate, which is amorphous—show the same sort of crystallite units. But there are differences, however, which appear to arise in respect of the arrangement of crystallites about the fibre axis: irregular arrangements produce photographic ring diagrams and regular arrangements produce point diagrams. Artificial silks (excepting acetate silk) have an intermediate arrangement: cotton treated with strong solution of sodium hydroxide (mercerized cotton) and washed without tension gives a ring diagram, but if it is washed under tension, a point diagram is obtained. Thus there is some direct evidence that the crystallites are probably identical in all these different materials and that differences of property may be related to differences of crystallite arrangement, more particularly with respect to fibre axis.

Empirical Composition.—The elementary composition of cellulose indicates that it is a carbohydrate containing carbon 44.4%, hydrogen 6.2%, oxygen 49.4% whence the empirical formula $C_6H_{10}O_5$ is derived which is identical with that of starch: it is thus non-nitrogenous, though originating in the cell protoplasm. The cellulose from the cell walls of the lower cryptogams, when purified, does, however, retain 2–4% of nitrogen and, when hydrolysed, it gives glucosamine in addition to monoses and acetic acid. The cellulose of phanerogams is generally associated in the plant with other complicated substances with which it forms the so-called "compound celluloses."

Chemical Constitution.—Cellulose is a complex polysaccharose or polyose of monosaccharoses or monoses: it may, in fact, be regarded as derived from monoses by the elimination of x molecules of water from x molecules of monose to form one molecule of polyose: thus $x C_6H_{12}O_6 - x H_2O \rightarrow (C_6H_{10}O_5)_x$. This reaction is evidently of fundamental importance in plant physiology. Conversely, cellulose is hydrolysed by acids to give dextrose: G. W. Monier Williams (J. Chem. Soc. 119 [1921], 803–805) obtained 90.67% of the theoretical amount of crystalline dextrose. J. C. Irvine and E. L. Hirst (J. Chem. Soc. 123 [1923], 518–532) showed also that cotton when methylated and hydrolysed gives a quantitative yield of 2:3:6-trimethyl dextrose: they have consolidated these facts, taken together, into a formula which expresses the constitution of cellulose in terms of three dextrose residues, linked together in a ring: thus

Various other formulae have been also suggested from time to time and it is still possible that no single formula will adequately represent the constitution of cellulose; but the evidence thus available appears to indicate that in the equation given above $x=3$.

Cellulose and Water: Hydrated Cellulose.—The interactions of cellulose and water involve questions of great interest and these questions are still open. So-called "hydrated cellulose," in which water is intimately associated with cellulose, may be produced in a number of ways; *e.g.*, (a) by mechanical comminution and pressure of cellulose with water, and this is essentially the method used industrially in the papermaker's "beater"; (b) by the action of strong solutions of certain salts such as zinc chloride, calcium sulphocyanide, cuprammonium solution (Schweizer's reagent), etc., and this is essentially the method used for making vulcanized fibre, cuprammonium silk and willesden goods; (c) by the action of strong solutions of alkalis, and this is essentially the mercerizing process used in the cotton textile industries and also the first step in the making of viscose; (d) by strong solutions of acids, and this is essentially the acid process of parchmentizing paper; (e) by regenerating cellulose from its esters, and this is essentially the process of making artificial silks—excepting acetate silk. Hydrated cellulose is cellulose associated with more or less water (even up to 90% water to 10% cellulose) to form a more or less swollen or gelatinous mass. The swelling of solids by imbibition of liquids and their dispersion in the liquids is quite a well known and common phenomenon: thus gelatine and starch will swell and, on warming, disperse in water: gelatine swells greatly, starch hardly at all, both disperse readily. On the other hand, cellulose neither swells nor disperses in pure water though it "hydrates" when it is subjected to continuous mechanical comminution and pressure, as it is in the "beater"; but in the various other circumstances detailed above it does show effects very similar to ordinary swelling and dispersion. The questions then arise, What is this "hydration" and is it analogous to swelling (imbibition) and dispersion as known in other substances such as those named? J. R. Katz (Physik. Zeit [1924] 25, 321) has examined the phenomena concerned by X-ray analysis and the diagrams he obtained, being in general the same for hydrated cellulose as for cellulose itself, appear to indicate that the water taken up is inter-crystallite rather than intra-molecular; the process would then be imbibition. It was also found, however, that when strong sodium hydrate solution is the hydrating agent a different X-ray diagram is obtained for the hydrated, alkali-cellulose produced and when the sodium hydrate is removed, by washing, the diagram for cellulose is obtained anew: this appears to indicate that the action in this instance is rather different, and reversible. The balance of evidence favours the interpretation that the hydration of cellulose is, for the present, to be regarded as a physical association of water with the crystallites of cellulose and not as an entry of water into the molecules. In cellulose hydrate, therefore, the water is not to be considered as held like the water in salt hydrates, called water of crystallization, though the nomenclature is the same. A definite salt hydrate such as Barium Chlorate, $\text{BaClO}_3 \cdot 10\text{H}_2\text{O}$, when dehydrated at constant temperature, will give up all its water at a definite and constant pressure equal to its vapour pressure at that temperature. Hydrated cellulose, on the other hand, when dehydrated, gives up its water at pressures falling gradually and continuously and without sign of constancy at any stage: this is characteristic of all systems in which water is held physically, *i.e.*, under inter-molecular rather than intra-molecular forces. At the same time it is also true that a certain relatively small proportion of the water might also be present bound within the molecules without its presence being discoverable in the presence of so large an excess of the physically held water, which would probably mask its presence. It cannot be said with absolute certainty, therefore, that the possibility of a definite hydrate of cellulose is altogether excluded. The hydration of cellulose is a factor of great importance in the economy of the plant, in determining the conditions of equilibrium between the water content of the cell wall and the sap. It is also no doubt a factor of great importance in the seasoning of timber.

Cellulose and Alkalis.—Though cotton cellulose is remarkably resistant to dilute alkalis, with a 15–20% solution of, *e.g.*, sodium hydroxide its ribbon-like fibre, with reticulated walls, swells out into a smooth walled cylinder. This was first noticed in 1844–1850 by John Mercer and in 1889 H. A. Lowe discovered that simultaneous stretching, to resist the contraction consequent on the swelling, imparted characteristic lustre to mercerized cotton. The quantity of sodium hydroxide thus taken up by the cellulose corresponds to some such proportions as $(C_6H_{10}O_5)_2NaOH$; but whether or not it is in chemical combination or in some physical association with the cellulose is not finally decided though more recent investigators appear to think the available evidence is more in accord with chemical combination than with physical association, and the work of J. R. Katz, referred to above, tends toward that conclusion. Oxides such as those of lead, manganese, barium, iron, aluminium and chromium are also taken up by cellulose in some sort of association, the cellulose scarcely changing in appearance (excepting colour), and industrial application is made of the fact in the dyeing and printing of fabrics. These effects are mainly colloidal, adsorption effects.

Cellulose and Acids.—Acids act upon cellulose according to their nature and their concentrations. Dilute acids or acids dried on to the fibre produce chiefly hydrocellulose, which is an indefinite product, perhaps consisting of small quantities of bodies of the nature of dextrines associated with unchanged cellulose. Stronger acids at first hydrate or parchmentize and finally hydrolyse cellulose to form dextrines and simple sugars. Under controlled conditions strong acids will react with cellulose to form esters. Hydrocellulose produced by the action of dilute acids or as recovered by, *e.g.*, the saponification of cellulose acetate, is soluble in alkali solutions, it reduces Fehling's solution, it forms esters more easily than does cellulose to give brittle substances of no industrial value and it has a greater affinity for dyes, such as methylene blue, than cellulose has. The constitution of hydrocellulose has been the subject of much investigation and much speculation with the only result that it has not been possible to distinguish its elementary composition from that of cellulose itself.

Cellulose and Oxidants.—Oxidizing agents such as nitric acid (60%), chloric acid, chromic acid, permanganates, hypochlorites, hydrogen peroxide and even air itself in presence of moisture and certain salts (the rotting of moist cotton cloth or rope in contact with iron is well known) or under the influence of strong sunlight, as in the tropics especially, change cellulose into oxycellulose with ultimate disintegration of the fibre and the formation of such substances, of low molecular weight, as carbonic and oxalic acids. Oxycelluloses contain free aldehydic groups, are easily attacked by hydrolysing agents and are decomposed by boiling with dilute hydrochloric acid to give relatively large yields of furfural. Oxycelluloses reduce Fehling's solution, have affinities for dyes and in general are difficult to distinguish from hydrocelluloses: esters also can be formed. The disintegration of cotton fabrics and of overbleached paper is usually referable to the formation of oxycelluloses.

Cellulose Esters.—Cellulose forms compounds called esters by reactions in which it behaves as a tri-hydric alcohol $C_6H_7O_2(OH)_3$. With, *e.g.*, nitric acid, the hydrogen of the acid and the hydroxyl of the cellulose are eliminated as water and NO_3 groups replace one, two or three of the OH groups to form the mono-, di- or tri-nitrates. To get the higher nitrates it is not sufficient to use nitric acid alone but strong sulphuric acid must be used with the nitric acid. After the reaction the cotton, which is usually used because of its freedom from hemicelluloses, has hardly changed its appearance, but it will be soluble in alcohol-ether if the di-nitrate and insoluble if the tri-nitrate: commonly, various mixtures of the nitrates will arise with varying conditions of nitration and much research work has been done in adjusting these conditions to specific purposes, particularly for the explosives industries. The di-nitrate, soluble in alcohol-ether, is familiar by the name of collodion and it is the basis of Chardonnnet, collodion or nitro artificial silk and also the celluloid, film, lacquer and plastic mass industries. The tri-nitrate is insoluble in ether-alcohol but soluble in nitro-glycerine and in other solvents: it is, of course, of very

great importance as an explosive. Cellulose reacts also with acetic anhydride to form mixtures (probably) of the acetate esters and, in presence of sulphuric acid or some other suitable substance acting as catalyst, the tri-acetate may be obtained, which is insoluble in acetone but soluble in chloroform: this acetate on hydrolysis yields 62.5% of acetic acid. If, however, this acetylation is carried out in the cold and, after completion of the acetylation, the product then heated, a change occurs which is probably a change of aggregation accompanied by partial hydrolysis and the tri-acetate, insoluble in acetone, passes into a form soluble in acetone and of good spinning quality. On hydrolysis, it yields about 55–58% of acetic acid.

Viscose.—The sodium xanthogenate ester, or viscose, is the basis of the viscose artificial silk industry which provides about 88% (1927) of the world's output of artificial silk. The reaction was patented by Cross and Bevan in 1892. High grade, bisulphite, wood-pulp is most usually, and cotton linters sometimes, used in making viscose industrially. It is treated with mercerizing (17%) sodium hydroxide solution for two hours, the surplus solution is then squeezed out and the resultant alkali-cellulose is torn into crumbs which are matured for 24 hours or more in a closed vessel: at this stage 60cc. of carbon bisulphide per 100 grams of air-dry cellulose used, are added and the crumbs then gradually swell and become deep-orange coloured and gelatinous. After the further addition of an appropriate quantity of water and sodium hydroxide solutions, and waiting a day or two, the fluidity will have increased so that the viscose may be spun: after some days the viscose begins to become more and more viscous until, finally, cellulose (reverted, hydrated cellulose) separates out as a congealed mass which can be dried to a very hard and dense material called "Viscoid." In the artificial silk industry the spun viscose filaments are immediately reverted to cellulose by immersion in a "setting" solution of sodium sulphate and sulphuric acid or other appropriate substances. The reactions of this remarkable process are not yet well understood. The quantity of sodium hydroxide required in the mercerizing stage is in the proportion of 2- C_6 cellulose units to 1-NaOH: the reactions thereafter, with carbon bisulphide and the reversion to cellulose (hydrated), may be represented as follows:

It is noteworthy that it has been possible to prepare only the mono-sodium xanthogenate ester. Cellulose esters of formic acid and also esters of the higher fatty acids, such as stearic acid, have been prepared: the latter are of interest as being probable constituents of cork and other cuticular "compound celluloses." Benzoyl and other aromatic esters have been also prepared.

Cellulose Ethers.—A true ether results when cellulose, acting as a tri-hydric alcohol, is condensed with the residue of another alcohol (R.OH) in presence of a suitable condensing agent; with elimination of water. One, two or three R.OH residues may react and R may be any of the legion of groups that confer alcoholic properties on the OH group. Thus the number of possible ethers of cellulose that can be prepared is also legion and a very large number have actually been prepared and described. Many of them are known to have valuable intrinsic qualities and only the relatively high cost of preparing them prevents their industrial utilization in competition with the esters (nitrate, acetate and xanthogenate). The reaction of formation may be represented as follows:

COMPOUND CELLULOSES

The celluloses from the cell walls of the phanerogams are generally associated with incrustants of complicated structure: *e.g.*, with pectins to form pecto-celluloses; with lignone to form ligno-celluloses; and with fatty acids to form adipo- or cuto-celluloses. These cellulosic materials are usually called "compound celluloses."

Pecto-celluloses.—The pectins with which cellulose is associated are complicated substances containing less carbon and

more oxygen than cellulose itself and their properties resemble those of the oxy-celluloses. The typical pecto-cellulose is flax fibre (*linum usitatissimum*).

Ligno-celluloses.—The typical ligno-cellulose of simplest type is jute fibre (*corchorus*). Ligno-celluloses constitute the main substance of the wood of trees. A great deal of work has been done in investigating the constitution of lignone after its separation from cellulose: its constitution *in situ* must be, of course, different. In the product obtained by the action of sulphurous acid on spruce wood various reactions indicate the presence of such groupings as

The $C_{21}H_{15}O_2$ -residue is probably a complex of multiple ring nuclei of benzene type. Chlorine reacts with the lignone of jute to form chlorides of constant composition $C_{18}H_{13}Cl_4O_6$ and $C_{18}H_{13}Cl_4O_8$, the latter of which reacts with sodium sulphite solution to form a soluble substance of characteristic magenta-red colour. Cellulose is thus isolated; and this is the standard method commonly employed for the evaluation of cellulose content in raw materials and known as "cellulose by chlorination." Industrially, the removal of lignone is of immense importance in the manufacture of pulp from wood, for the paper industries: the three important processes being the so-called "bisulphite," "soda" and "sodium sulphate" processes.

Adipo- or Cuto-celluloses.—These compound celluloses are resolved by alkali-saponification into cellulose and a mixture of fatty acids of peculiar and little known constitution; among which, however, such acids as stearic acid may be ingredients. They occur chiefly, but by no means solely, in corticular and cuticular tissues, leaves and stems.

Decomposition Products of Celluloses.—The formation of coal and the distillation of wood are special decompositions, dealt with in the articles COAL and WOOD DISTILLATION. The hydrolysis of cellulose by acids has been mentioned above. Oxalic acid is prepared industrially by fusing sawdust with a mixture of sodium and potassium hydroxides in flat, iron pans and, from the mixed salts of oxalic acid thus obtained, the free acid is prepared by subsequent treatment. The bacterial decomposition of cellulose, known for a long time in connection with the digestive processes of the Herbivora, in the decompositions of sewage and marshland and in the processes of soil humus, have latterly attracted new interest, with the object of bringing them under productive control. Methane producers, hydrogen producers, denitrifiers and thermophilic species of organisms are known among the bacteria that attack cellulose; and in some instances attempts have been made to make industrial applications of their action. It is said that cellulose is not essentially more resistant to bacterial attack than are starches and sugars and the products obtained from its decomposition are closely related to conditions: thus, with limited aeration acetic acid is the main product, whereas, increased aeration favours the production of ethyl alcohol. Deterioration of quality in badly stored cellulose materials, the decay of wood and the formation of coal are no doubt related to these general phenomena. An aerobic organism isolated from Rothamsted soil decomposes cellulose rapidly with formation of a yellow pigment, fatty acids and a mucilage resembling pectin, at an optimum temperature of 30°C.: other carbohydrates do not support growth. These facts have been applied to the preparation of synthetic farmyard manure, and other artificial fertilizers, from garden refuse.

Cellulose in the Arts and Industries.—This is the age of cellulose as much as it is the age of iron and steel: e.g., cotton is now the basis of the largest item of international trade. The cellulose material of British industries is mostly exotic: practically, a small proportion of the wood for structural work is home grown and a considerable proportion of the flax of the linen industry: within the Empire a very large proportion of the world's jute crop is produced, about 12% of the cotton used in British mills and much wood and pulp. The applications of cellulose and cellulose materials to the necessities, amenities, and luxuries of modern life may be classified as follows:

A. CELLULOSE AND COMPOUND CELLULOSE MATERIALS:

(a) **Foodstuffs:** The foodstuffs of animals, and therefore of man, are produced ultimately by plants; but the average plant turns most of its sugars not into starch which is digestible but into cellulose which is not; hoofed animals, however, harbour in their digestive tracts bacteria that attack cellulose, on the decomposition products of which the animals live; and hence it is through their flesh that cellulose becomes ultimately a source of food for man.

(b) *Textiles:*

Fine:—Cotton, flax (hemp, ramie) for clothing, dress and other decorative materials.

Coarse:—Lower grades of the above and also especially jute for wrappings, balings, matings and coverings of all kinds.

Manila, sisal, phormium for cordage, ropes and twines.

Miscellaneous:—Cereal straws, wood materials (canes), raffia, for hat-making, basket work. Coir, bast, kapok, for mat-making, stuffing, packing and upholstery.

(c) **Paper Making:**—Many of the above materials, usually the wastes of other arts and industries, are used up for the manufacture of paper, straw boards, papier maché. Pulps from wood and grasses (e.g., esparto).

(d) **Constructional:**—Timber structures, carpentry, joinery, cabinet-making (woods).

(e) **Linoleum and Cork Industries.**

B. CELLULOSE DERIVATIVES:—Either the esters or reverted cellulose.

(a) **Explosives:**—Tri-nitro cellulose.

(b) **Artificial silks:**—Chardonnet, collodion or nitro-artificial silk; cuprammonium silk; viscose silk; acetate silk.

(c) **Films, tissues:**—Celluloid, inflammable film made from nitro-cellulose; acetate, non-inflammable film made from cellulose acetate; cellophane, wrapping tissue made from viscose; bottle-caps (hermetic closure) from viscose. Safety glass, a three-ply material made by cementing nitro or acetate film between two sheets of glass.

(d) **Lacquers:**—Nitro-cellulose dissolved in special solvents with special softeners, pigmented and applied by brush, or patent sprayer, for motorcar bodies and other high-class work out-of-doors; cellulose acetate, used similarly, especially as "dope" for aeroplane wings, to which it gives a shrunk finish and is also non-inflammable.

(e) **Plastic masses for moulded articles:**—Nitro-cellulose often mixed with camphor, pigments and other substances in great variety—celluloid. Also cellulose acetate as lonarite.

(f) **Waterproofing and sizing of fabrics:**—Willesden goods by the cuprammonium process, of military, webbing-equipment by the viscose process; artists' canvases and other fabrics, by viscose. Vulcanized fibre, from paper hydrated by zinc chloride or other solution.

C. DECOMPOSITION PRODUCTS OF CELLULOSE AND COMPOUND CELLULOSE.

(a) **Coal.**

(b) **Wood distillation products:**—Oxalic acid.

(c) **Bacterial decompositions:**—Power gas, industrial alcohol, organic acids, synthetic farmyard manure.

CELSIUS, ANDERS (1701-1744), Swedish astronomer, was born, on Nov. 27, 1701, in Uppsala, where he was professor of astronomy (1730-44). At Nuremberg he published in 1733 a collection of 316 observations of the aurora borealis made by himself and others 1716-32. In Paris he advocated the measurement of an arc of the meridian in Lapland, and took part, in 1736, in the expedition organized for the purpose by the French Academy. Six years later he described the centigrade thermometer in a paper read before the Swedish Academy of Sciences (see THERMOMETRY). Celsius died at Uppsala on April 25, 1744. He wrote: *Nova Methodus distantiam solis a terra determinandi* (1730); *De observationibus pro figura telluris determinanda* (1738); besides many less important works. The centigrade thermometer is often called the Celsius thermometer, as other thermometers are named after Fahrenheit and Réaumur.

See W. Ostwald's *Klassiker der exakten Wissenschaften*, No. 57 (Leipzig, 1904), where Celsius's memoir on the thermometric scale is given in German with critical and biographical notes.

CELSIUS SCALE: see THERMOMETRY.

CELSUS (c. A.D. 178), an eclectic Platonist and opponent of Christianity known mainly through the reputation of his work, *The True Word* (or *Account*; ἀληθὴς λόγος), brought to light in 248 by Origen who in his *Against Celsus* quotes, paraphrases and reproduces about nine-tenths of it. On internal evidence the work seems to be of Alexandrian origin and to date between 176–180.

Its attack on Christianity is opened by a rehearsal of Jewish taunts levelled at the Christians. Jesus was the natural son of Mary and Joseph. He did not convince even His own countrymen. His companions as well as His poverty were inconsistent with divine dignity. The Incarnation is absurd, for God stands in no special relation to man as against animals. Christ's miracles, like His resurrection, were inventions of His disciples. The Christians lack unity among themselves and their teachers, have no power over educated men. Their doctrine comes from Plato and the Stoics, especially their belief in the future life and the spirituality of God. Their resurrection of the body is a corruption of the doctrine of transmigration and ignores the fact that matter is evil. Celsus ends his work by inviting the Christians to join the religion of the majority, to become good citizens, to give thanks to the powers of nature and to abandon the idea of establishing the universal rule of their doctrines. His work, which shows the strength of the Church in his day, is conspicuous for its lack of bitterness against the Christians, its recognition of the abuses of paganism, and its knowledge of the Old Testament and the Synoptic Gospels and also of the gnostic writings. Echoes of it are found in Tertullian and Minucius Felix (q.v.), but it lay forgotten until Origen gave it new life.

Celsus was not a professed philosopher but a man of the world whose religion was the empire. His keen mind combined an intimate knowledge and appreciation of the various national religions and mythologies with many genuine moral convictions as well as a sceptical tendency. For him, philosophy alone could impart some notion of the Father of the universe, a notion which the elect soul must develop.

BIBLIOGRAPHY.—*The True Word* is contained in Origen's work *Against Celsus*, published in Migne: *Patrol. Graec.* xi. The text has been reconstructed, and trans. into Ger. by T. Keim *Celsus Wahres Wort* (1873). See J. Patrick *The Apology of Origen* (1892); L. Rougier *Celse* (Paris, 1925); F. S. Muth, *Der Kampf des heidnischen Philosophen Celsus gegen das Christentum* (Mainz, 1899); A. Harnack *Gesch. der altchristlichen Lit.* I.; and Herzog, *Realencyclopädie*.

CELT or **KELT**, the generic name of an ancient people, the bulk of whom inhabited the central and western parts of Europe. (For the sense of a primitive stone tool, see the separate article, **CELT**.) Much confusion has arisen from the inaccurate use of the terms "Celt" and "Celtic." It is the practice to speak of rather short and dark-complexioned Celtic-speaking people of France, Great Britain and Ireland as Celts, although the ancient writers seem to have applied the term "Celt" chiefly to folk of great stature and with fair hair and blue or grey eyes.

The ancient writers regarded as homogeneous all the fair-haired peoples dwelling north of the Alps, the Greeks terming them all *Keltioi*. Physically they fall into two loosely-divided groups, which shade off into each other. The first of these is restricted to north-western Europe, having its chief seat in Scandinavia. It is distinguished by a long head, a long face, a narrow aquiline nose, blue eyes, very light hair and great stature. Those are the peoples usually termed Nordic. The other group is marked by a round head, a broad face, a nose often rather broad and heavy, hazel-grey eyes, light chestnut hair; they are thick-set and of medium height. This race is often termed "Celtic" or "Alpine" from the fact of its occurrence all along the great mountain chain from south-west France, in Savoy, in Switzerland, the Po valley and Tirol, as well as in Auvergne, Brittany, Normandy, Burgundy, the Ardennes and the Vosges. It thus stands geographically and in physical features between the "Nordic" type of Scandinavian and the so-called "Mediterranean race" with its long head, long face, its rather broad nose, dark brown or black hair, dark eyes and slender form, and medium height. In the Alps and the Danube valley some of the Celts or their forefathers had dwelt from the Stone Age. But it was during the development of the La Tène

culture that the Celts attained their maximum power, and it was the La Tène period (500 B.C.–A.D. 1) that witnessed the tremendous and remarkable expansion of these people from their homeland in Central Europe. Much of their power has been ascribed to great skill in metallurgy, especially as regards the working of the native iron resources.

The beginning of the 3rd century B.C. was the period of the greatest Celtic movement, but the expansion had no doubt begun long before that period. One of the earliest advances was directed against the Mediterranean coast of France, and at much the same time other bands of the Celts spread southwards into Spain, penetrating into that country as far south as Gades (Cadiz), some tribes, e.g. Turdantani and Turduli, forming permanent settlements and being still powerful there in Roman times; and in northern central Spain, from the mixture of Celts with the native Iberians, the population henceforward was called Celtiberian. About this time also took place a great invasion of Italy; Segovisus and Bellovisus, the nephews of Ambigatus, led armies through Switzerland, and over the Brenner and by the Maritime Alps, respectively (Livy v. 34). The tribes who sent some of their numbers to invade Italy and settle there were the Bituriges, Arverni, Senones, Aedui, Ambarri, Carnuti and Aulerici.

Certain material remains found in north Italy, e.g., at Sesto Calende, may belong to this invasion. The next great wave of Celts recorded swept down on north Italy shortly before 400 B.C. These invaders broke up in a few years the Etruscan power, and even occupied Rome herself after the disaster on the Allia (390 B.C.). Bought off by gold they withdrew from Rome, but they continued to hold a great part of northern Italy, extending as far south as Sena Gallica (*Sinigaglia*), and henceforward they were a standing source of danger to Rome, especially in the Samnite Wars, until at last they were either subdued or expelled, e.g., the Boii from the plains of the Po. At the same time as the invasion of Italy they had made fresh descents into the Danube valley and the upper Balkan, and perhaps may have pushed into southern Russia, but at this time they never made their way into Greece, though the Athenian ladies copied the style of hair and dress of the Cimbrian women. About 280 B.C. the Celts gathered a great host at the head of the Adriatic, and accompanied by the Illyrian tribe of Autariatae, they overthrew the Macedonians, overran Thessaly, and invaded Phocis in order to sack Delphi, but they were finally repulsed, chiefly by the efforts of the Aetolians (279 B.C.). The remnant of those who returned from Greece joined that part of their army which had remained in Thrace, and marched for the Hellespont. Here some of their number settled near Byzantium, having conquered the native Thracians, and made Tyle their capital. The Byzantines had to pay them a yearly tribute of 80 talents, until on the death of the Gallic king Cavarus (some time after 220 B.C.) they were annihilated by the Thracians. The main body of the Gauls who had marched to the Hellespont crossed it under the leadership of Leonnorus and Lutarius. Straightway they overran the greater part of Asia Minor, and laid under tribute all west of Taurus, even the Seleucid kings. At last Attila, king of Pergamum, defeated them in a series of battles commemorated on the Pergamene sculptures, and henceforth they were confined to a strip of land in the interior of Asia Minor, the Galatia of history. Their three tribes—Trocmi, Tolistobogians and Tectosages—submitted to Rome (189 B.C.), but they remained autonomous till the death of their king Amyntas, when Augustus erected Galatia into a province. Their descendants were probably St. Paul's "foolish Galatians" (see **GALATIA**.)

Nor was it only towards the south and the Hellespont that the Celtic tide ever set. They passed eastward to the Danube mouth and into southern Russia, as far as the Sea of Azov, mingling with the Scythians, as is proved by the name Celto-scyths. Mithridates VI. of Pontus seems to have negotiated with them to gain their aid against Rome, and Bituitus, a Gallic mercenary, was with him at his death.

The Celts moved westwards likewise and two divisions of them reached the British Isles, namely the Brythons and the Goidels. The Brythons crossed the channel and established themselves in England and Wales but the Goidels, probably in the 4th

century B.C., passed directly from the mouth of the Loire to Ireland where they quickly became a ruling caste. At a much later period there were settlements of Goidels from Ireland on the western fringe of England, Wales and Scotland. The Celtic invasions of the British Isles are in all probability to be correlated with the advent of the La Tène culture (though this is a disputed point), and it is now thought to be unlikely that the invaders came over in large migrating hordes that displaced the older population. It is more probable that the new Celtic strain was quickly merged in the native races and that the principal result of the invasion was that the Celtic over-lords imposed the Celtic language on the indigenous folk.

See Ridgeway, *Early Age of Greece*, vol. i., and *Oldest Irish Epic*; Ripley, *The Races of Europe*; Sergi, *The Mediterranean Race*; Éoin MacNeill, *Phases of Irish History*; T. D. Kendrick, *The Druids*.

CELT (kēlt, also sēlt), as once used by British and French archaeologists, described the hatchets, adzes or chisels of chipped or shaped stone used by primitive man. The word is variously derived from the Welsh *cellt*, a flintstone (the material of which the weapons are chiefly made, though celts of basalt, felstone and jade are found), from being supposed to be the implement peculiar to the Celtic peoples; or, more probably, from a Low Latin word *celtis*, a chisel. The term is somewhat loosely applied to metal as well as stone axe-heads. In general form, stone celts approach an oval in section, with sides more or less straight and one end broader and sharper than the other. In length they vary from about two to as much as 16 inches. Some were fixed in wooden handles, and in the later stone adzes, holes are sometimes found pierced to receive the handles.

The term "celt" has been largely superseded by "axe," though it is by no means certain that all "celts" were "axes." Some, such as the larger ones of ground stone, may well have been used in agriculture for moving the soil. Many were doubtless mounted as adzes, particularly those of the "shoe-last" type (*Schuhlastenbeil*), which have a very wide European distribution from the Balkans to Scandinavia.

Bronze celts are found in Europe, in Siberia, India (the Shan States) and China. They are flat, flanged, winged and socketed. An intermediate form is called "palstave"; and it has been suggested that the socketed celt was derived from the palstave by a natural transition, the invention being attributed to the people of the Lausitz culture of Germany. It is equally possible that the socketed celt was suggested by the beating over of the wings of the winged celt of Switzerland and Bavaria. Both explanations may be correct. The socket itself had been independently invented in England in the early bronze age, where it was applied to the spearhead.

In the west of England the country folks believe that the weapons fell originally from the sky as "thunderbolts," and that the water in which they are boiled is a specific for rheumatism. In the north and in Scotland they are safeguards against cattle diseases. In Brittany a stone celt is thrown into a well to purify the water. In Sweden they are regarded as a protection against lightning. In Norway the belief is that, if they are genuine thunderbolts, a thread tied round them when placed on hot coals will not burn but will become moist. In Germany, Spain, Italy, the same beliefs prevailed. In Japan the stones are accounted of medicinal value, while in Burma and Assam they are regarded as thunderbolts and as infallible specifics for ophthalmia. In Africa they are the weapons of the Thunder God. In India and among the Greeks the hatchet appears to have had a sacred importance, derived, doubtless from the universal superstitious awe with which these weapons of prehistoric man were regarded.

See Sir J. Evans, *Ancient Stone Implements of Great Britain*; Lord Avebury, *Prehistoric Times* (1865-1900) and *Origin of Civilization* (1870); E. B. Tylor, *Anthropology and Primitive Culture*. For the history of polished stone axes up to the 17th century see Dr. Marcel Baudouin and Lionel Bonnemère in the *Bulletin de la Société d'Anthropologie de Paris* (April-May, 1905).

CELTES, KONRAD (1450-1508), German humanist and Latin poet, was born at Wipfeld, near Schweinfurt. After studying at Heidelberg Celtes led the wandering life of a scholar of the Renaissance, teaching in various universities, and everywhere

establishing learned societies on the model of the academy of Pomponius Laetus at Rome. Among these was the *Sodalitas litteraria Rhenana* or *Celtica* at Mainz (1491). In 1486 he published his first book, *Ars versificandi et carminum*, which gained him the honour of being crowned as the first poet laureate of Germany, the ceremony being performed by the emperor, Frederick III., at the diet of Nuremberg in 1487. In 1497 he was appointed by the emperor, Maximilian I., professor of poetry and rhetoric at Vienna, and in 1502 was made head of the new Collegium Poetarum et Mathematicorum, with the right of conferring the laureateship. He did much to introduce system into the methods of teaching, to purify the Latin of learned intercourse, and to further the study of the classics, especially the Greek. But he was more than a mere classicist of the Renaissance. He was keenly interested in history and topography, especially in that of his native country. It was he who first unearthed (in the convent of 'St. Emmeran at Regensburg) the Latin poems of the nun, Hrosvitha of Gandersheim, of which he published an edition (Nuremberg, 1501). He also published an historical poem, *Ligurinus sive de rebus gestis Frederici primi imperatoris libri x.* (Augsburg, 1507), and the map of the Roman empire known as the *Tabula Peutingeriana* (after Konrad Peutinger, to whom he left it). He projected a great work on Germany; but of this only the *Germania generalis* and an historical work in prose, *De origine, situ, moribus et institutis Nurimbergae libellus*, appeared. As a writer of Latin verse Celtes far surpassed any of his predecessors. His epigrams, edited by Hartfelder, were published at Berlin in 1881. His editions of the classics are now, of course, out of date.

For a full list of Celtes's works see Engelbert Klüpfel, *De vita et scriptis Conradi Celtis* (Freiburg, 1827); also Johann Aschbach, *Die früheren Wanderjahre des Conrad Celtis* (1869); Hartmann, *Konrad Celtis in Nürnberg* (Nuremberg, 1889).

CELTIBERIA, a term used by Greek and Roman writers to denote sometimes the whole north-east of Spain, and sometimes the north-east part of the central plateau. The latter was the correct use. The Celtiberi were the most war-like people in Spain, and for a long time offered a stubborn resistance to the Romans. They served both Carthaginians and Romans as mercenaries, and Livy (xxiv. 40), states that they were the first mercenaries in the Roman army. In 179 B.C. the whole country was subdued by T. Sempronius Gracchus, who by his generous treatment of the vanquished gained their esteem and affection. In 153 they again revolted, and were not finally overcome until the capture of Numantia by Scipio the younger (133 B.C.). After the fall of Numantia, and still more after the death of Sertorius (72 B.C.), the Celtiberians became gradually romanized, and town life grew up among their valleys; Clunia, for instance, became a Roman municipality, and ruins of its walls, gates and theatre testify to its civilization; Bilbilis (Bambola), another municipality, was the birthplace of Martial.

The Celtiberians may have been descendants of Celtic immigrants from Gaul into Iberia (Spain), or a mixed race of Celts and Spaniards (Iberians); that a strong Celtic element existed in Spain is proved both by numerous traditions and by the more trustworthy evidence of place-names.

Their country was rough and unfruitful as a whole (barley, however, was cultivated), being chiefly used for the pasture of sheep. Its inhabitants either led a nomadic life or occupied small villages; large towns were few. Their infantry and cavalry were both excellent. They carried double-edged swords and short daggers for use hand to hand; their defensive armour was a light Gallic shield, or a round wicker buckler, and greaves of felt round their legs. They wore brazen helmets with purple crests, and rough-haired black cloaks, in which they slept on the bare ground. They were said to offer sacrifice to a nameless god at the time of the full moon, when all the household danced together before the doors of the houses.

Although cruel to their enemies, they were hospitable to strangers. They ate meat of all kinds, and drank a kind of mead.

E. Hübner's Article in Pauly-Wissowa's *Realencyklopädie*, iii. (1886-93), collects all the ancient references.

CELTIC LANGUAGES. The Celtic languages form one group of the Indo-European family of languages, intermediate

between the Italic and Teutonic groups, but distinguished from these and other branches of the family by certain well-marked characteristics, the most notable of which are the loss of initial and inter-vocalic *p*, and the change of I.-E. *ē* to *ī*, the I.-E. labialized velar *gv* is represented by *b*, while the medial aspirates *bh*, *dh*, *gh* result in simple voiced stops. I.-E. sonant *r* and *l* become *ri*, *li*. The initial mutations which are so characteristic of the living languages arose after the Romans had left Britain. The Celtic languages and the Italic dialects stand in a close relationship to one another. The features common to both Celtic and Italic are: (1) the gen. sing. ending *-ī* of masc. and neut. stems in *o*; (2) verbal nouns in *-tion*; (3) the *b*-future; (4) the passive formation in *-r*.

The various Celtic dialects are: (1) Gaulish; (2) Goidelic, including Irish, Scottish Gaelic, and Manx; (3) Brythonic, including Welsh, Breton, and Cornish. Gaulish and Brythonic change the I.-E. labialized velar guttural *qu* to *p*, whilst the Goidelic dialects retain the *qu*, which later gives up the labial element and becomes *k*.

See separate articles INDO-EUROPEAN LANGUAGES, GAULISH, IRISH GAELIC, MANX, GOIDELIC, BRYTHONIC. Tourneur, *Esquisse d'une histoire des études celtiques*, vol. ii. with full bibliography (Liège, 1905); Zeuss's *Grammatica Celtica* as revised by Ebel; a comparative grammar of the Celtic dialects by H. Pedersen (Göttingen, 1908); H. Zimmer, "Die Kelt. Litteraturen" in *Die Kultur d. Gegenwart*, T. i. Abh. xi. I. (Berlin and Leipzig, 1909). See also Whitley Stokes and A. Bezzenberger, *Wortschatz der keltischen sprach-einheit* (Göttingen, 1894); A. Meillet and M. Cohen, *Les Langues du Monde* (1924).

CELTIC LITERATURE: see BRETON LITERATURE, IRISH LITERATURE, CORNISH LITERATURE, WELSH LITERATURE AND SCOTTISH LITERATURE.

CELTUM is the name given by G. Urbain and A. Dauvillier to the element of atomic number 72, for which the former obtained some evidence from X-ray spectra in 1911. Their claim to have discovered this element was, however, disputed by D. Coster and G. Hevesy (1923) who named it *Hafnium*, under which heading it is described. Of the resulting polemical papers only a few are suggested for reference.

BIBLIOGRAPHY.—D. Coster and G. Hevesy, *Nature*, **111**, pp. 79, 252, 462 (1923). G. Urbain and/or A. Dauvillier, *ibid.*, p. 218, *Comptes rendus*, 176, p. 676 (1923); *Chemistry and Industry*, 42, p. 764 (1923).

CEMBAL D'AMORE or **CEMBAL D'AMOUR**, a keyboard instrument invented by the famous organ and clavichord maker, Gottfried Silbermann, who was later so prominently identified with the earlier pianofortes. It was a kind of clavichord with strings of double the usual length, and its other mechanism modified to correspond, but it was not a success.

CEMBALO or **CIMBALO**, the Italian names for a dulcimer (*cf.* cymbal); whence, in due course, clavicembalo for a pianoforte, otherwise a keyed dulcimer. Hence, too, the frequent use of "cembalo" in earlier days in the case of pianoforte music, the word as used in such cases being merely a contraction of "clavicembalo." (*See* DULCIMER.)

CEMENT. The word "Cement" apparently was first used of a mixture of broken stone, tiles, etc., with some binding material, and later it was used of a material capable of adhering to, and uniting into a cohesive mass, portions of substances not in themselves adhesive. The use of cementing material dates from very early days, and it is probable that adhesive clay was one of the first materials used for uniting stones, etc. Bitumen probably was also used for the same purpose, while the use of burnt gypsum, and also lime, dates back to the time of the Egyptians.

In its widest sense the word "cement" includes an infinite variety of materials and ranges from the clay used to bind stones and other materials together to form the natives' huts in tropical countries, or the clay in the sand used by small boys to make sand models, up to the modern rapid hardening cements which are capable of binding three times their own weight of sand together in such a way that, at the end of 24 hours, they will stand a compression of several thousand pounds per square inch. It also includes those materials which join individual crystals together to

form masses of rock, etc., such as the cementitious material which joins the grains of sand together in a sandstone, and ultimately merges into glues, solders and adhesives in general, between which there is no sharply defined line of demarcation.

In its more restricted sense, particularly if it is unqualified and used in connection with building and engineering, the word practically always means Portland cement, as this is by far the most important cement used at the present time, the world's output amounting to millions of tons per annum. A fairly full description of this cement is therefore justified, and a brief description of other cements will be given towards the end of this article.

Portland Cement.—Portland cement is made by burning a mixture of calcareous and argillaceous material to clinking temperature, and grinding the resulting clinker. The mixture may be a natural one, such as the marls, or an artificial one, such as chalk or limestone, for the calcareous material, and clay or shale for the argillaceous material. The binding qualities of modern cements are very considerable, and it is possible to make good concrete from properly graded sand and ballast with the use of 1 part of cement to 12, or more, parts of aggregate; but, as it is not always possible in practice to obtain a thorough distribution of cement throughout the mass, it is customary to use a larger proportion of cement, *e.g.*, 1:3:5 parts of cement, sand and gravel, and, for a better quality concrete, 1 part of cement to 2 or 3 parts of sand, and 3 or 4 parts of gravel. A good cement mortar can be made from 1 part of cement to 4 or 5 parts of clean sharp sand, free from clay. If the mixture is too rich, *e.g.*, equal parts of sand and cement, there is danger of cracks due to shrinkage, and apart from this the extra strength gained by using a greater proportion of cement than 1 to 3 of sand is so small that the additional cost is not justified.

History.—Very little definite information about the preparation and uses of cement can be found before the 18th century. Various districts gained reputations for the special qualities of their lime cements, such as the power of setting hard under water, but the reasons for these special qualities were not known until the last century. John Smeaton was one of the first to make any serious attempt to grapple with the question of the cause of the varying hydraulic properties of different lime cements. In 1756, whilst engaged on the construction of the Eddystone lighthouse, he made a series of experiments to find the best cement capable of hardening under water. The result of these experiments revealed the fact that the best hydraulic limes were made from limestone containing an appreciable quantity of clay. This led to a number of investigators carrying out experiments. In 1796 Parker invented his "Roman cement," which was made by "reducing to powder certain burnt stones or argillaceous productions called 'noddles' of clay." This cement "will set . . . in 10 or 20 minutes either in or out of water." The raw materials for Roman cement were burnt to just short of the vitrifying temperature, whereas for hydraulic lime the raw materials were heated to a much lower temperature, which was just sufficient to decompose the calcium carbonate. This was a distinct advance, as the overburnt or vitrified pieces of lime had formerly been picked out and rejected as being useless for mortar.

Vicat, in 1813, made a series of experiments on the effect of adding different clays in varying proportions to slaked lime, and then burning the mixture. The success of these experiments led other investigators to try artificial mixtures of clay and calcareous materials and in 1822 Frost brought out his "British cement," which was soon followed by Aspdin (1824) with "Portland cement." Both of these, however, were hydraulic limes, in that the mixtures were only calcined and not clinkered. Aspdin was apparently the first to use the word "Portland" to define a particular type of cement, although Smeaton, over half a century earlier, had said that cement made from these materials would "equal the best merchantable Portland stone in solidity and durability." His "Portland cement" was, of course, quite different from modern Portland cement, but nevertheless the colour and properties of concrete made from this cement were somewhat similar to Portland stone.

By this time (1820-30) works were springing up in various

parts of the country where the raw materials were suitable; Parker's "Roman cement" was manufactured at Northfleet, Kent, "British cement" was made by Frost at Swanscombe, and the Aspdins were making "Portland" cement at Wakefield and Gateshead. This Portland cement, as mentioned above, was more of the nature of hydraulic lime; but about 1845 Mr. I. C. Johnson, who was then manager of Messrs. White & Sons' works at Swanscombe, Kent, produced a cement of the modern Portland cement type, by burning the raw materials "with unusually strong heat until the mass was nearly vitrified," and this clinker, when finely ground, made a cement which was far in advance of the ordinary type produced at that time.

During the next few years many works started making true Portland cement, both in Britain and in other countries. In France, Dupont and Demarle were delivering fairly large quantities of Portland cement in 1850 from their works at Boulogne-sur-Mer and the demand continued to grow. Naturally with such a demand, and with such scanty knowledge as to the special requirements necessary for ensuring the production of good sound cement, a large quantity of inferior material came on to the market, and failures resulting from this gave the cement a doubtful reputation. Investigations for improving the quality of cement continued with moderate results. Grant's tests, in 1865, show an average tensile strength of 353.2 lb. for $2\frac{1}{2}$ sq. in. ($1\frac{1}{2}$ in. \times $1\frac{1}{2}$ in.) cement and sand briquettes (1:1) at seven days (157 lb. per sq. in.), while in 1878 a tensile strength of 500 lb. ($2\frac{1}{2}$ in. briquettes), i.e., 222 lb. per sq. in., was specified for briquettes made from 6 parts of cement to 10 parts of sharp sand. This may be compared with modern rapid hardening cement, which, with 1 part of cement to 3 parts of standard sand, has a tensile strength of over 500 lb., and sometimes over 600 lb. per sq. in. after 24 hours.

Manufacture.—When cement was first made from "stone noddles," as in Parker's method, the stone was placed in a bottle kiln or dome kiln ordinarily used for burning lime. When at a later date artificial mixtures of chalk and argillaceous materials were used, it was found that the best and most intimate mixtures were made by beating clay and chalk into a thin slip or slurry with water. This slurry was then allowed to stand in large settling tanks, or "backs," until the material had settled, and the water was drawn off and the deposit dried and burned. The time taken for the settling and drying of the raw materials was so great that efforts were made to improve the kiln (which, of course, could only be fed with dry material) by utilizing the waste heat for drying the slurry. One of the first of these was the chamber kiln of I. C. Johnson, which consisted of a long horizontal chamber connected with the top of the ordinary kiln, so that the hot gases from the latter had to pass through the chamber on the way to the chimney stack. The liquid slurry, either from the "backs" or direct from the washmill, was placed on the floor of the chamber and was effectively dried by the hot gases passing over it, providing the layer of slurry was not too thick. The chamber had to be of considerable length in order to provide floor space to dry sufficient slurry for a full charge of the kiln, and improvements in the direction of shortening this were made by Batchelor and others, by providing two or three floors one above the other. Coke was used for burning the raw materials and ranged from 8–9 cwt. per ton of clinker. In 1870 Goreham patented his method of grinding his slurry with burr stones, thereby producing a better slurry and containing only 40–42% of water, a proportion much less than was usual at that time, which, of course, facilitated drying. The construction of the bottle kiln, even in its improved form, the chamber kiln, necessitated intermittent firing, as each charge of fuel and dried slurry had to be built up by hand. Experiments with the object of doing away with this costly intermittent method led to the development of shaft kilns, with continuous burning of the raw material. The shaft kiln, as its name implies, consists of a vertical shaft, the top of which leads into a chimney. A few feet from the ground level removable bars are fixed across the shaft. On to these bars is placed a layer of coke, then alternate layers of dried slurry and coke until the kiln is filled. The coke at the bottom is fired,

and this burns the raw material above it, while the hot gases pass through and heat the layers above. As the coke burns away the cement clinker drops on to the bars and heats the incoming air, while the burning zone rises to about half way up the shaft. The partly cooled clinker on the bars is removed from time to time and fresh layers of dried slurry and coke are put in on top. The process thus becomes continuous, and the loss of time in wait-

ing for the kiln to heat up and cool down, together with the resultant loss of heat, which is unavoidable with the chamber kiln, is entirely overcome in the shaft kiln. Modifications of the shaft kiln were patented by Dietsch (fig. 1), Stein, Schneider and others, and the different types became known by the names of the patentees. The next improvement was the use of forced draught instead of natural induced draught from the chimneys, and tests on a standard Schneider kiln showed an increase in output from the normal 70 tons per week to 150 tons per week when using mechanical draught.

FIG. 1.—DIETSCH SHAFT KILN
Fresh layers of coke and slurry are added from the top as soon as the coke at the bottom is burned away, thus keeping the burning process continuous

One of the weaknesses of the shaft kiln—or a fixed kiln—is the difficulty of ensuring even burning of the clinker, some of it being under burnt while other portions were heavily clinkered, and various mechanical improvements have been made in the grate with the object of keeping the whole of the material in the kiln on the move by the continuous withdrawal of the clinker. The improvements in the shaft kiln reduced the quantity of fuel required from 70 to 80% of the weight of good clinker produced by the old kiln to 20 to 30% (dried slurry being used in both cases). This economy of fuel and the small amount of handling required, together with low capital cost, render the shaft kiln method suitable for use where the small output does not justify the cost of the rotary kiln.

Other methods of preventing the waste of heat resulting from the heating up and cooling of the old type of kiln were investigated. One of the most successful was the Hoffman Ring kiln, which consisted of a number of kilns arranged in a ring round a central chimney. The flues from the kilns are so arranged that air, which is heated by being drawn through clinker which is cooling, is used for burning the fuel in the next kiln or two, and the hot gases are drawn through the other kilns to heat the raw materials before passing into the main flue. These ring kilns are very economical with regard to fuel but require skilled hands for charging, and the labour costs are high.

Another method, which laid the foundations for the modern rotary kiln process, was devised by Thomas Russell Crampton, who in 1877 patented a method for burning "Portland and other cements in revolving furnaces heated by the gases resulting from the combustion of coal or carbonaceous material" or "by the combustion of air and powdered carbonaceous material."

In 1885 Frederick Ransome patented a method of burning dry powdered materials in a rotating cylinder by means of which he hoped to obtain the finished product from the kiln in a powder form sufficiently fine for use without further grinding, evidently overlooking the fact that clinkering is an essential process in the manufacture of true Portland cement. He also stated that the raw material might be fed in either at the chimney end of the kiln or at the firing end, which suggests that he had not appreciated the full value of feeding the kiln at the end opposite to that used for burning the fuel. Further improvements were effected by F. W. S. Stokes who, in 1888, patented a method of drying the slurry by passing the hot gases from the rotating kiln through a revolving drum on to the outside of which the slurry was fed. He also used another revolving drum for cooling the clinker,

ANALYSES OF TYPICAL MATERIALS

| | Chalk | Limestone | Blue Lias limestone | Marl | Gault clay | Clay | Shale |
|---|--------|-----------|---------------------|--------|------------|--------|--------|
| | % | % | % | % | % | % | % |
| Silica (SiO_2) | 5.94 | 1.16 | 12.66 | 13.10 | 37.68 | 58.78 | 60.20 |

utilizing the waste heat for heating the air supplied to the fuel in the kiln. In 1895 and 1896 E. H. Hurry and H. J. Seaman obtained various patents for improvements in cooling the clinker, arrangements for using powdered coal with an air blast for burning, etc., and various other developments have been made with the rotary kiln, until it has very nearly displaced all others where a large output of Portland cement clinker is required. Among the first rotary kilns erected was that at Arlesley (1887). This was 26ft. long and 5ft. in diameter, and forms an interesting comparison with those now in common use, which are 200 to 300ft. long, and 8½ft. to 12½ft. in diameter.

Modern practice is to grind a mixture of suitable calcareous and argillaceous materials, either wet or dry, in such proportions as will give the correct composition to the finished cement. The wet ground material is pumped, in the form of a slurry containing about 40% of water, into a series of large mixing tanks having a capacity of 1,000 to 2,000 tons of slurry, and from these it is pumped into the kiln. The dry ground raw material is carried by a conveyor to the storage bins, and from the bins it is fed into the kiln after having been damped to prevent too much dust being blown up the chimney. The raw material, either in the form of slurry or damp meal, enters the kiln at the top end close to the chimney and meets the oncoming hot gases. As the kiln revolves the raw materials fall down towards the clinkering zone, having been first dried by the hot gases, and then having the carbon dioxide driven off from the calcareous materials. In the clinkering zone, where the heat is maintained by the combustion of powdered coal carried in by a blast of air, the lime of the calcareous materials combines with the silica and alumina of the argillaceous materials, and at this stage they partially fuse or clinker together, an action which is facilitated by the alkalies and iron oxide, etc., in the materials. The partially fused product or "cement clinker" passes from the lower end of the kiln to the cooler, where it parts with some of its heat to the air going to the kiln. The clinker, with the addition of a little gypsum or water to regulate the setting time, is then ground in ball and tube mills to such a fineness that the finished product—Portland cement—leaves a residue of under 10%, usually 1–3%, on a sieve having 32,400 meshes to the square inch.

The raw materials consist of argillaceous or alumina and silica bearing materials and calcareous materials, the former including clay, shale, slate, etc., and some forms of slag, and the latter including chalk, limestone, marine shells, etc., while many materials such as marls, gault clays, cement rock, etc., contain natural mixtures of both the calcareous and argillaceous constituents.

The method of obtaining the raw materials will depend on whether they are hard or soft. With soft materials, such as clay, marl, and soft chalk, a steam digger or scraper is used. After the "overburden" or top refuse material has been removed, a face is opened up in the material. The steam digger is brought up to this face, and the teeth of the digger bite into the material, and, on being lifted upwards, break or cut away lumps which fall into the bucket. The bucket, which holds from ½ to 3 or more cubic yards, is swung round and emptied into a truck which is then taken to the washmill. For very soft materials, such as mud or clay under water, a dredging machine—a form of chain bucket excavator—is used. For hard materials, e.g., limestone, etc., the rock is blasted with an explosive such as gelignite, which will

break it into pieces sufficiently small for the crusher to take. If the pieces are too large they are very difficult to handle or break again, and it is in regulating the position and depth of the boreholes, and the size of the charge, that the good quarry foreman shows his skill in obtaining the greatest quantity of loose rock of the right size with the least cost. The broken rock lying at the base of the quarry is picked up by a steam shovel or a grab, taking up 3 or more cubic yards at a time, put into trucks and taken to the mills.

Grinding Raw Materials.—The methods used depend on whether the materials are soft or hard. Soft materials are usually washed down with water until they form a slurry of the consistency of cream, containing about 40% of water. The trucks of marl or chalk and clay are tipped into a washmill, which consists of a large circular tank of concrete about 14ft. or more in diameter, with baffles and slotted screens (½in. to ¾in. slots) let into the sides. Water is allowed to run into the mill and a number of harrows suspended on chains from radial arms from the centre of the mill are caused to revolve at a rapid rate. These harrows break up the large pieces of chalk, etc., and by dashing the raw materials, suspended in the water, against the screens and baffles, break up the clay and chalk into such fine particles that about 98% will pass through a sieve having 180 meshes to the linear inch. If, owing to the presence of coarse particles of sand, etc., the slurry is too coarse, it may be necessary to finish it off in a tube mill. In America the 200 mesh sieve is commonly used.

Hard materials are first put through a crusher which may be of the jaw type, in which the stone is fed in between two steel jaws set at an angle, one of which moves backwards and forwards with a rocking motion, or through a gyratory crusher, in which the gyratory motion of a central jaw causes a crushing action against an outer jaw, or through some other form of crusher suitable for large stone. The crushed stone is fed into smaller crushers which may be one of the above types, or a hammer mill in which rods with hinged hammer heads are allowed to swing round rapidly and break the stone against stationary bars on the outer edge of the mill, or if the material is sufficiently soft it may be fed into crushing rolls.

From this fine crushing the small stone is taken by a conveyor to the tube mills, and thence to the kiln. The process differs according as the dry process or the wet process is used. In the dry process the limestone and shale, etc., are fed into the mills from the weighing machines or feed tables (which regulate the quantity) in such proportions as will give a finished product of the correct composition. The mills may be of various types. In the ball and tube mill, separate or combined, steel balls falling over each other in a revolving cylinder have a pounding or hammering action on the particles of stone between the balls. In the centrifugal type of mill a heavy mass of steel is caused to revolve rapidly, and centrifugal force causes it to press against a stationary ring and exerts both a crushing and grinding action on the stone between the revolving weight and the ring. In the Fuller mill the revolving weights are large steel balls, in the Griffin mills they are large pestles, while in mills of the Hercules, Huntingdon, Sturtevant and Kent types they consist of movable or swinging rolls.

The finely ground raw meal from the mills is passed into the storage bin, whence it is fed into the kiln, after being damped if

The cement industry is the fourth largest manufacturing user of bituminous coal, and the largest consumer of pulverized coal. Oil or gas is used at some plants instead of coal.

The cement industry is the fourth largest shipper of manufactured materials. The cement produced in a year would fill 725,000 freight cars.

Powdered coal is blown through the tube in the centre of the kiln, shown in foreground, burning with a temperature ranging from 2,500 to 3,000 degrees Fahrenheit. 3. General view of kilns and coolers under construc-

tion. The rotary kilns are shown on top and the coolers below. Such kilns are the largest pieces of rotating machinery used in all industry, each being as big as three Pullman cars. The rock is heated to incipient fusion in a forty-foot tongue of flame. One such kiln will turn out some 1,500 barrels of cement clinker a day

CEMENT

CEMENT MANUFACTURE

1. Process of cement manufacture (part four)
2. Interior of air separator room, showing the air pumps which handle the powdered material through pipes
3. General view of modern cement plant during construction, showing large storage bins
4. Filling sacks with cement. The bags are filled by machines which force the cement through a self-closing valve at the bottom. Each sack when filled weighs exactly 94 lb.
5. Aerial view of cement mill in operation. There are now about 150 cement plants, operating in 30 States, in the United States

necessary. From this point the treatment is the same as the wet process. The advantage of the dry process is a small saving of fuel, and of water, if the supply is limited. The disadvantages are many, the chief one being the difficulty of getting the raw materials mixed sufficiently well to ensure even composition, and there also is the difficulty and extra cost of grinding the materials sufficiently fine when dry, and of drying the materials if they are not quite dry. In England the dry process is practically never used, and in those countries where the dry process was in general use, such as America, there is a marked tendency to change over to the wet process.

In the wet process the limestone and shale from the feed tables, or weighing machines, are fed into the ball mill and then the tube mill, or into a compound mill where the two are combined, and the requisite quantity of water added at the same time. The normal slurry coming from the mills contains about 40% of water, and leaves under 2% residue on a sieve having 180 meshes to the linear inch, but as it occasionally contains coarse particles which have passed through the mills, it is customary to put the slurry through a separator, usually of a centrifugal type, which rejects all the coarse particles. The slurry from the sump of the washmill, in the case of soft materials, the tube mill in the case of hard materials, or the separator, is pumped to the mixers, which are large tanks capable of holding 1,000 to 2,000 tons of slurry. These mixers serve three purposes—(1) they allow of corrections being made in the composition of the slurry, (2) they overcome any temporary variation in the composition by dispersing it and mixing it with the large bulk, and (3) they give efficient storage, allowing the grinding plant to be shut down over the week end (and at night, if required) while the kiln continues to run. To prevent settlement in the tanks the slurry is continuously kept on the move. The usual method is to have the mixer, about 60–80ft. diameter, and 10–12ft. deep, fitted with radial arms with the bearing in the centre of the mixer. From these horizontal arms are suspended vertical arms, which act as mixers, and these are geared together, so that while in the first instance they revolve round themselves, the resistance of the slurry against the walls reacts on the vertical arms and causes both the horizontal and vertical arms to rotate round the centre, and the whole of the contents of the mixer is thus constantly stirred. In other types of mixers the slurry is kept in motion by suitable paddles, or by air being forced through from below. In the latter method it is customary to have deep mixers with a conical bottom, the main air supply being in the centre of the cone, while subsidiary air jets are distributed on the sides of the cone. Sometimes they have both air and mechanical arrangements, thus making a very efficient mixer.

From the mixers the slurry is pumped to a small tank at the top end of the kiln, whence it is fed into the kiln at such rate as the burner thinks necessary. The usual method of doing this is by a spoon feed, the revolving spoons dipping into the tank and delivering the slurry into the kiln. Occasionally the feed is regulated by a variable orifice leading into a delivery pipe. Whichever of these two methods is used, it is the regular practice to keep the tank at constant level by over pumping and allowing the excess of slurry to run back to the mixer through an overflow pipe. Other methods, such as the spray feed and dewatering the slurry by means of vacuum filters, have been tried with some success.

Burning.—The most essential part of the manufacture of Portland cement is the complete chemical combination of certain constituents, viz., silica, alumina and lime. The other constituents, particularly the iron oxide and alkalies, play their part but are subsidiary to the three main constituents. These readily combine at a high temperature, but at this temperature it is difficult to get the kiln lining to stand up, and therefore every means should be taken which will assist the chemical combination to take place at a somewhat lower temperature, and also prevent any excessive attack on the lining bricks. Fine grinding plays an important part in meeting the first of these two requirements, and the second is met by obtaining a coating of a more fusible slurry to adhere to the lining brick, and thus protect them.

The kiln itself consists of a cylindrical shell made of steel

plates, lined with fire bricks for nearly the whole of its length. The length varies from 150ft. to 350ft. or more, and the diameter from 8ft. to 14ft., usually with an enlarged diameter at the firing zone, so that the clinker may be allowed to "soak" at the high temperature. The kiln itself is carried on three to six tyres, according to its length, and is driven by a gear ring usually fixed a little below the middle of the kiln. The expansion of the kiln is considerable, and therefore the tyres and gear ring are not riveted directly on to the kiln, lest they be fractured, but are fixed to metal bands riveted at one end to the kiln, and are also supported by guide blocks. As the kiln is set at an angle usually of 1 in 25, the tendency of the kiln to slide down, while revolving, is counteracted by having the faces of the tyres and the supporting rollers set at an angle. As a further precaution check rollers are fixed so that should the kiln slip down a little these rollers come into action on the side of the tyres and stop the kiln from slipping off the supporting rollers. At the upper end, where the slurry, or damp meal, is fed in, the kiln passes into the dust chamber, through a joint which is reasonably tight to prevent loss of draught, and the hot gases, having deposited a large portion of the dust, are led into the chimney. The lower end of the kiln is fitted with a large adjustable hood set on rails, which allows of complete regulation of the ingoing air, the bulk of which is heated by passing through the clinker coolers, which may either be an extension of the kiln or a separate unit under the kiln, into which the white hot clinker drops. Through the centre of the hood is the coal injector, a metal tube through which powdered coal is blown by a powerful blast to supply the heat necessary for burning the clinker. Small doors are also fixed on the front of the hood, on the left and right of the coal inlet, and one below. The first two allow the burner, who is a skilled man, to see the type of flame being produced in the kiln, and the lower one enables him to see the clinker. Considerable care and skill are required in burning, and a good man can show his skill not only in producing maximum output of highest grade clinker with the minimum quantity of fuel, but, given good plant, in prolonging the life of the kiln lining and preventing stoppages due to "ringing up," etc., caused by faulty and irregular burning.

Clinker Grinding.—The clinker as it comes from the kiln is in a fairly stable condition, and may be stored for months in the open if necessary without any appreciable deterioration. This, however, represents so much locked up capital, and it is therefore customary to grind the clinker soon after it is made. Very fresh clinker appears to be a little tougher than clinker which has been allowed to stand a week or two, and this sometimes affects the power required for grinding. The clinker from modern kilns is usually small enough to be fed directly into a ball mill or a high speed mill, but if it is too large it is passed through a crusher first. As it is usually necessary to add a definite proportion of gypsum to the clinker in order to regulate the setting time of the cement, both the clinker and gypsum are passed over feed tables before being mixed and fed into the mills. The feed tables are simple devices for regulating the quantity of any material passing over them in a given time and consist of a revolving table, fixed scrapers and a vertical feed pipe, with an adjustable collar, just above the centre of the feed table. The material falls in a heap in the centre of the table, and as it revolves a portion of the material is guided by the scrapers away from the heap to the edge of the table, whence it falls on to a conveyor and is taken to the mills. The heap in the centre is at once replenished from the feed pipe, and the size of the heap, and therefore the quantity removed by the scraper, is regulated by the height of the adjustable collar of the feed pipe above the table.

The mills used for grinding the clinker are of the same types as those described for the grinding of the raw materials. The type most frequently used for clinker grinding in modern plant in Britain is the compound mill, which is usually 7 or 8ft. in diameter and 30 to 40ft. long.

The fineness of the finished cement is specified by the British Standard Specification to be such that the residue on a sieve having 32,400 meshes per sq.in. shall not exceed 10%. Usually the ordinary cement has from 1 to 3% residue.

Storing and Packing.—The cement from the mills is delivered on to a belt conveyor, and then by means of bucket conveyors to the storage bins or silos, each of which holds from 250 to several thousand tons. The cement is drawn from these bins or silos as required and is filled into sacks, casks or paper bags reinforced with fabric. The packing is sometimes done by hand, but more often by mechanical means. In the Exilor method of packing, tubes from the bottom of the silo lead into the tops of two small chambers or cupboards, with one door which can be used to close either one of the two chambers. At the bottom of each chamber is a small weighing machine which at a predetermined weight will drop and open the air valve. To work the machine, for sack filling, the operator fastens the mouth of the sack round the inlet pipe and closes the door. This starts a small electric air pump working, which makes a partial vacuum, sufficient to suck the cement out of the silo into the sack. As soon as the correct weight of cement has been delivered into the sack the sack drops, opens the air valve, and by breaking the vacuum causes the flow of cement to cease. While this is taking place the operator removes the filled sack from the second chamber, puts a fresh sack on the inlet pipe, and swings the door round to close this chamber, the cycle of operations being repeated as often as required. In the valve packing machine each sack or paper bag is fitted with a little sleeve valve inside the bottom of the sack, with the opening at one end well inside the sack, while the other end opens outside the bottom corner of the sack. To fill the sack the mouth is first tied up, usually by wire twist ties, and the valve is slipped over the spout of the filling machine, the sack being upside down. Cement is supplied to the machines through a hopper and is pushed through the spout by a paddle wheel.

Lay-out of Works.—For the purpose of economy and efficiency, considerable care must be exercised in the "lay-out" of the works, so that the raw materials and coal are delivered at the places where they are to be used, and the clinker and cement stores are in the proper position for the minimum handling of these materials.

Analysis and Tests.—In order to ensure that nothing but reliable cement reaches the market, standard specifications have been drawn up by different countries. Space will not allow of these being given in detail, but the British Engineering Standards Association Specification (1925) gives a good general idea of the minimum quality demanded, although most of the best cements are far above this. The mechanical tests are as follow, and by the side are placed the results of tests made on an ordinary Portland cement of good quality.

| Specification | Portland cement |
|---|-----------------|
| Fineness | |
| Residue on 180x180 mesh per in. sieve, 10% maximum | 3.0% |
| Residue on 76x76 mesh per in. sieve. 1% maximum | Trace |
| Soundness | |
| Expansion by the Le Chatelier test, 10mm. maximum | 1.0mm. |
| Setting time | |
| Initial set, 30m. minimum | 4h. 5m. |
| Final set, 10hrs. maximum | 5h. 10m. |
| Tensile test | |
| (Breaking strain in lb. per sq.in. of briquettes 1in. x 1in. in section): | |
| Neat (7 days), 600lb. minimum | 946lb. |
| 3 sand to 1 cement (7 days), 325lb. minimum | 478lb. |

With the specified sliding scale for increase of the sand briquettes at 28 days, viz., $\frac{10,000}{7 \text{ days}}$ plus the strength at 7 days, at 325 b. for 7 days, the strength at 28 days should be 365.8lb. per sq. n. minimum. With 478lb. at 7 days, the 28 days' tests should be 199 lb. Actually this cement gave 616 lb., an increase of 117 lb. over that specified.

Composition.—The composition of Portland cement varies over a somewhat wide range. The specification gives the following limits.

| | Maximum |
|--|---------|
| Magnesia | 4.0% |
| Total sulphur, calculated as sulphuric anhydride | 2.75% |
| Insoluble residue | 1.5% |
| Loss on ignition | 3.0% |
| Ratio of lime to silica and alumina (calculated in chemical equivalents) is to be between 2 and 2.9. | |

The composition of English Portland cement varies according to the district. The two analyses given below show the difference. The first is from the Thames and Medway district, and the second from the Blue Lias deposits.

| | No. 1 % | No. 2 % |
|---|------------|------------|
| Silica (SiO ₂) | 21.42 | 24.20 |
| Insoluble residue | 0.22 | 0.18 |
| Alumina (Al ₂ O ₃) | 6.36 | 4.16 |
| Ferric oxide (Fe ₂ O ₃) | 3.30 | 2.10 |
| Lime (CaO) | 63.40 | 65.70 |
| Magnesia (MgO) | 1.07 | 1.25 |
| Sulphuric anhydride (SO ₃) | 1.88 | 1.21 |
| Carbonic anhydride (CO ₂) and combined water (H ₂ O) | 1.90 | 0.66 |
| Alkalies and loss on ignition | 0.45 | 0.54 |
| | 100.00 | 100.00 |

Uses of Portland Cement.—The demand for Portland cement for use in structural work continues to grow, and, in addition to this, Portland cement is being used for an increasing variety of purposes (*see CONCRETE*), which can only be briefly mentioned. Concrete, sometimes reinforced with iron or steel, is being used for all big structural buildings, engineering works, harbours, docks, ships, piers, bridges, piles, general building, artificial stone, roads (both foundation and surface), water towers, natatorium, lakes, etc., and the facility with which the concrete can be placed in any position and the fact that local stone and sand can frequently be used to the extent of 5 to 10 parts to 1 of cement are very important points with regard to cost of labour and carriage, as compared with that of stone. Concrete is also used for smaller articles such as telegraph poles, railway signal posts, sleepers, fencing posts, monuments, tombstones, coffins, troughs of various kinds, tiles, bricks, pipes (spun and moulded), paving blocks, manhole covers, etc. Very considerable developments have also been made in the use of cement for ornamental work, including not only that required for buildings, but sculptural work of all description, both large and small; and by the introduction of various aggregates, excellent substitutes for different ornamental stones have been made, frequently having improved weathering properties. Portland cement is particularly useful where there is much repetition of ornamental work, *e.g.*, for the capitals of pillars, tracery, etc. In the case of stone each piece must be carved separately, whereas a few moulds will be sufficient for a large number of blocks of cement concrete.

Theory of Setting.—The reason for the setting and hardening of Portland cement continues to afford abundance of scope for fascinating research work. The comparatively simple ternary system of the lime-silica-alumina group becomes very complicated through thermal changes which are very dependent on the temperature from which the clinker is cooled, and also on the rate of cooling. Moreover, the balance of solution of the various constituents is modified by the different impurities included in the clinker. In addition to this there is some evidence that the constituents of the cement itself tend to acquire a more stable condition on storage. The investigation of the setting and hardening of cement is still more difficult. The simple hydration theory of earlier days has, on closer investigation, resolved itself into an extremely complex system which includes an infinite number of partially hydrated compounds, together with the formation of new compounds. A large amount of research work has been carried out on fairly pure preparations of the various silicates and aluminates of lime with good results; but their value is restricted because very different and complex action takes place when they are mixed, which accounts for the widely differing results obtained by the most recent research. Some of the above compounds have helped in the identification of some of the constituents in set cement, *e.g.*, small hexagonal plate crystals of tricalcium alumi-

nate, fine needle crystals of mono-calcium silicate, colloidal masses of mono-calcium silicate, large hexagonal crystals of calcium hydrate, etc., and apparently the colloidal mono-calcium silicate plays a large part in the hardening of the cement. Thus the two schools of theorists—the crystalline and colloidal—are being brought together. Although no final conclusions have been reached, the general results of these investigations have been valuable and have resulted in a very marked improvement in the quality of Portland cement.

OTHER CEMENTS

Rapid Hardening Cements.—The necessity for overcoming the delay in urgent work caused by the comparatively slow hardening of Portland cement has resulted in a demand for rapid hardening cements. Such cements must be sufficiently slow setting to allow of the concrete being placed in position before the initial set of the cement has taken place, and should harden sufficiently rapidly for the shuttering to be struck or removed by the following day. Rapid hardening cement is also in great demand for pre-cast work, as the moulds can be removed and used again more frequently, and it is particularly useful for road work where it is possible to lay the wood blocks, etc., on the day following the laying of the concrete, instead of waiting several days for the concrete to harden. The demand for such rapid hardening cement has led to the development of two different types of cement, one an improved Portland cement and the other an aluminous cement. The former is made in the same manner as ordinary Portland cement, but the variation in composition is much more restricted and great attention has to be given to correct burning and to very fine grinding of the raw materials and the finished product. The results of the tests and analyses of a cement of this type are as follows:—

| | |
|---|-----------|
| Fineness: | |
| Residue on 180×180 mesh per in. sieve | 0.4% |
| Residue on 76×76 mesh per in. sieve | Nil |
| Soundness: | |
| Expansion (Le Chatelier test) | 0.5mm. |
| Setting time: | |
| Initial set | 1hr. 25m. |
| Final set | 2hr. 15m. |
| Tensile strength: | |
| Breaking strain in lb. per sq.in. of briquettes 1in.×1in. in section. | |
| Neat (7 days) | 885lb. |
| 3 Sand to 1 Cement. | |
| (24 hours) | 602lb. |
| (7 days) | 705lb. |
| (28 days) | 760lb. |

Compression test:

Sand and Cement cubes (3:1) at 24 hours gave a compression strength of 5,000lb. per square inch.

| | | |
|---|--|--------|
| Analysis: | | % |
| Silica (SiO ₂) | | 20.05 |
| Insoluble residue | | 0.35 |
| Alumina (Al ₂ O ₃) | | 6.52 |
| Ferric oxide (Fe ₂ O ₃) | | 2.52 |
| Lime (CaO) | | 64.68 |
| Magnesia (MgO) | | 0.95 |
| Sulphuric anhydride (SO ₃) | | 2.26 |
| Carbonic anhydride (CO ₂) and combined water (H ₂ O) | | 2.22 |
| Alkalis and loss on ignition | | 0.45 |
| | | 100.00 |
| Lime, after deduction for calcium sulphate | | 63.10% |
| Lime ratio | | 2.83 |

The aluminous type of cement depends largely on mono-calcium aluminate for its rapid hardening properties. There is a very considerable rise of temperature during, and soon after, setting and this facilitates the hardening of the cement, as well as being of great assistance when work is being carried out in frosty weather. This cement develops great strength in 24 hours, and piles have been made one day and picked up and driven with a pile driver on the next.

The cement is made by the complete fusion of impure bauxite and limestone, thus differing from Portland cement; and this difference accounts largely for the resistance which it shows under certain corroding conditions which affect Portland cement.

Some of the mechanical tests on concrete made in England with this cement gave remarkable results at short periods, more particularly the compression tests. One of these, which has been published, showed an average compressive strength at 24 hours of 8,000lb. per sq.in. with 6in. cubes made from 4 parts of Thames ballast ($\frac{3}{4}$ in. to $\frac{1}{2}$ in.), 2 parts of Thames sand (under $\frac{1}{4}$ in.) and 1 part of aluminous cement. The tensile tests do not show up to such advantage, as the ratio of strength in compression and tension is much greater with aluminous cement than it is with Portland cement. The tests and analysis of an ordinary sample of aluminous cement are as follow:—

| | |
|--|-----------|
| Fineness. | |
| Residue on 180×180 mesh per in. sieve | 8.5% |
| Residue on 76×76 mesh per in. sieve | Trace |
| Soundness. | |
| Expansion (Le Chatelier test) | 0.5mm |
| Setting time. | |
| Initial set | 2hr. 12m. |
| Final set | 3hr. 15m. |
| Tensile test. (Breaking strain in lb. per sq.in. of briquettes 1in.×1in. in section) | |
| Neat (7 days) | 1,275 lb. |
| Sand | |
| (24 hours) | 538 |
| (7 days) | 560 |
| (28 days) | 630 |
| Analysis. | |
| Silica (SiO ₂) | 7.80 |
| Insoluble residue | 0.80 |
| Alumina (Al ₂ O ₃) | 36.23 |
| Ferric oxide (Fe ₂ O ₃) | 2.34 |
| Ferrous oxide (FeO) (and metallic iron calculated as ferrous oxide) | 5.83 |
| Titanium oxide (TiO ₂) | 3.92 |
| Lime (CaO) | 41.97 |
| Magnesia (MgO) | 0.47 |
| Sulphuric anhydride (SO ₃) | 0.22 |
| Sulphur (as sulphide) | 0.11 |
| Carbonic anhydride (CO ₂), combined water (H ₂ O), alkalis and loss | 0.36 |
| | 100.05 |
| Deduct oxygen equivalent to sulphur | 0.05 |
| | 100.00 |

Lime Cements.—These include various grades, from the pure “fat” white lime through the grey limes to the hydraulic limes which have already been referred to under Portland cement. White lime consists of oxide of calcium, or, in its slaked form, hydrate of calcium. It is prepared by calcining calcium carbonate (chalk or limestone) until all the carbonic anhydride has been driven off and only the oxide is left. This oxide (quicklime) has great affinity for water, with which it combines readily, forming calcium hydrate, or slaked lime. This action is exothermic, *i.e.*, gives out heat, and is very vigorous unless it is properly controlled. The dry slaked lime occupies two or three times the volume of the original quicklime, according to the method by which it is slaked. Grey lime is an impure form of white lime, and, according to the quantity and nature of the impurities, its properties vary between white lime and hydraulic lime. The latter differs from white or grey lime in that, owing to the amount of argillaceous material contained in it, the lime slakes comparatively slowly, and when used for making mortar is capable of hardening under water.

Lime, probably on account of its long history, is frequently made in the simplest form of kiln, the bottle kiln, which is extremely extravagant with both coal and labour, particularly if white lime is being produced, as this must be kept free from the ash of the fuel. Various other kilns, such as those described under Portland cement, are also used, but the rotary kiln is not in very general use for lime burning, although by firing with producer gas very pure lime can be obtained from this kiln with great economy of labour and fuel, provided that the raw material is sufficiently pure. Another great advantage of this kiln is that it will take “smalls,” *i.e.*, material which is so small that it would choke a stationary kiln, and therefore has to be rejected. On the other hand, a rotary kiln is not suitable for burning large lumps of chalk or limestone, and as there is a certain demand for large lumps of

FIG. 2.—DIAGRAM OF LAYOUT OF A WET PROCESS CEMENT PLANT

The raw materials are ground to a slurry which is then pumped into the mixers and from there to the rotating kiln. In passing through the kiln it becomes dried, then decarbonated and finally, in the burning zone, clinkered. The white hot clinker passes through coolers, heating the air for the kilns, and when cool, is ground in tube mills

lime (probably because of the uncertain quality of the fine stuff in the earlier days), it is still necessary to use fixed kilns if this demand is to be met.

Lime, before it is used for mortar, must be slaked, and this was formerly done at the place where it was to be used. On account of the irregular way in which this was sometimes carried out, portions of the less pure lime used to slake and expand after the mortar had been used and cause the work to "blow." To overcome this trouble, architects and others frequently specify that the mortar should be made up 2 or 3 months before use. This method of overcoming the difficulty was at the expense of the strength of the finished mortar, for the lime was carbonating and deteriorating during this period. The modern method is to slake the lime mechanically at the lime works and remove the slaked lime from the unslaked by air separation. The slaked lime is then stored in bulk for 10 to 14 days, after which it is ready for use, yielding a lime which is free from any risk of "blowing," and at the same time retaining its hardening properties unimpaired.

Mortar made from white lime and the purer forms of grey lime works very easily under the trowel, and, if necessary, can be floated off to a very smooth surface for facing walls, etc., and on account of this property the white lime is frequently spoken of as "fat" lime because it is supposed to suggest the smoothness of butter. Experiments have been made to improve the lime for mortar purposes, etc., by the addition of various substances to the water used for slaking, or to the slaked lime.

The setting of white lime and grey lime is largely due to "drying out," and to a small extent calcium hydrate recrystallization. The hardening appears to be almost entirely due to the lime combining with the carbon dioxide in the air and forming calcium carbonate, although this is sometimes assisted by a slight pozzuolanic effect of the silica in the sand or other material used with the lime. In hydraulic lime the setting and hardening properties are due to a combination of the above with that of those constituents which are similar to Portland cement. For most purposes Portland cement has taken the place of hydraulic lime; but there are still certain conditions where the latter is preferable to the former, particularly for embedding large steel sections, where the hardening effect should not take place until the steel has finally settled into position.

Selenitic Cement.—The addition of 5 to 10% of plaster of Paris to lime increases the hardening properties of the latter by 50 to 100%, and this mixture is sometimes known as Selenitic cement.

Pozzuolanic Cement.—Lime, in the presence of water, readily combines with silica in the active state and forms a calcium silicate similar to that in Portland cement. Various natural and artificial materials, such as pozzuolana, trass, keiselguhr, pumice, tufa, santorin earth, granulated slag, etc., contain active silica, and where the cost is low they make a useful addition to lime mortar. To obtain the best effect the granulated slag, or other material, should be ground with the lime until both materials are in a fine

state of division and intimately mixed. When properly made, pozzuolanic cements will attain a strength approaching that of Portland cement; but frequently the material is simply mixed with the lime, and the bulk of the pozzuolanic material acts as an aggregate instead of an active constituent of the cement.

Calcium Sulphate Cements.—This class includes all those cements which primarily depend on the hydration of calcium sulphate for their setting and hardening properties, and includes plaster of Paris, Keene's cement, Parian cement, etc. The raw material is gypsum (*g.v.*), which may be almost chemically pure, in which case it is suitable for Keene's cement and other special brands, or may contain a small quantity of foreign matter, when it is suitable for ordinary plaster of Paris. The mode of preparation is to calcine the gypsum at a comparatively low temperature, viz., about 205° C for plaster of Paris, at which temperature the gypsum loses three-fourths of its combined water, and at about 500° C for the Keene's cement class, when the whole of the combined water is driven off. At a higher temperature the gypsum becomes "dead burnt" and will then only hydrate very slowly, or in some cases not at all. The gypsum for plaster of Paris is usually calcined either in ovens or in kettles, and for Keene's cement in kilns, where the ash of the fuel can be kept away from the finished product. These methods are inferior in economy to the rotary kiln, and this type of kiln will probably be the method of the future, as, if fired with producer gas, the product is not contaminated with ash. The setting of plaster of Paris depends on the fact that when $2\text{CaSO}_4 \cdot \text{H}_2\text{O}$ is treated with water it dissolves, forming a super-saturated solution of $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$. The excess held temporarily in solution is then deposited in crystals of $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$. In the light of this knowledge the mode of setting of plaster of Paris becomes clear. The plaster is mixed with a quantity of water sufficient to make it into a smooth paste; this quantity of water is quite insufficient to dissolve the whole of it, but it dissolves a small part and gives a super-saturated solution of $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$. In a few minutes the surplus hydrated calcium sulphate is deposited from the solution and the water is capable again of dissolving $2\text{CaSO}_4 \cdot \text{H}_2\text{O}$, which in turn is fully hydrated and deposited as $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$. The process goes on until a relatively small quantity of water has by instalments dissolved and hydrated the $2\text{CaSO}_4 \cdot \text{H}_2\text{O}$, and has deposited $\text{CaSO}_4 \cdot \text{H}_2\text{O}$ in felted crystals forming a solid mass well cemented together. The setting is rapid occupying only a few minutes, and is accompanied by a considerable expansion of the mass. There is reason to suppose that the change described takes place in two stages, the gypsum first forming orthorhombic crystals and then crystallizing in the monosymmetric system. Gypsum thus crystallized in its normal monosymmetric form is more stable under ordinary conditions than the orthorhombic form. Correlatively, in its process of dehydration to form plaster of Paris, monosymmetric gypsum is converted into the orthorhombic form before it begins to be dehydrated. The essential difference between the setting of Keene's cement and that of plaster of Paris is that the former takes place

much more slowly, occupying hours instead of minutes, and the considerable heating and expansion which characterize the setting of plaster of Paris are much less marked.

It is the practice in Great Britain to burn pure gypsum at a low temperature so as to convert it into the hydrate $2\text{CaSO}_4 \cdot \text{H}_2\text{O}$, to soak the lumps in a solution of alum or of aluminium sulphate, and to recalcine them at about 500° Centigrade. Instead of alum various other salts—borax, cream of tartar, potassium carbonate, etc.—may be used. On grinding the recalcined lumps they give Keene's cement, Parian cement, Keating's cement, etc. The quantity of these materials is so small that analyses of Keene's cement show it to be almost pure anhydrous calcium sulphate, and make it difficult to explain what, if any, influence these minute amounts of alum and the like can exert on the setting of the cement.

These cements form excellent decorative plasters on account of their clean white colour and the sharpness of the castings made from them, this latter quality being due to their expansion when setting. Keene's cement is especially adaptable for surfaces where a hard polished finish is required. All cements having calcium sulphate as their base are suitable only for indoor work because of their solubility in water.

Oxychloride Cements.—In 1853 Sorel discovered that zinc chloride solution, when mixed with zinc oxide, formed a very hard cement, and later he found that magnesium chloride, magnesia and various other metallic oxides and chlorides did the same, an oxychloride being formed in each case. Of these the most important is the magnesia oxychloride, commonly known as Sorel cement, and on account of its great strength and unusual binding properties it is used for such widely different purposes as uniting carborundum for grindstones, where great strength and rigidity are required, and binding wood sawdust together to form monolithic floors which have a certain amount of spring in them. It is also used for making artificial marble and other ornamental stone, and if cast on glass which has been waxed to prevent adhesion the material, on removal of the glass, will have a highly glazed surface.

The magnesia, which should be freshly calcined and ground, is mixed with several times its volume of carborundum, wood sawdust, sand or other material, and is then moistened with a solution of magnesium chloride having a density of 25° – 30° Baume, and thoroughly mixed so that each grain of material is covered with the magnesia oxychloride. The plastic mass is then put into moulds, or placed in position and "floated" off. The speed of setting and hardening is dependent on the freshness of the magnesia and the strength of the solution of the magnesium chloride, and when the right strength has been found for any particular batch of materials this should be rigidly adhered to for the work.

Adhesive Cements.—Mixtures of animal, mineral and vegetable substances are employed in great variety in the arts for making joints, mending broken china, etc. A strong cement for alabaster and marble, which sets in a day, may be prepared by mixing 12 parts of Portland cement, 8 of fine sand and 1 of infusorial earth, and making them into a thick paste with silicate of soda; the object to be cemented need not be heated. Casein, with some solvent, usually an alkali, forms the basis of many waterproof cements and cold water glues. For stone, marble and earthenware a strong cement, insoluble in water, can be made as follows:—skimmed-milk cheese is boiled in water till of a gluey consistency, washed, kneaded well in cold water, and incorporated with quicklime; the composition is warmed for use. A similar cement is a mixture of dried fresh curd with one-tenth of its weight of quicklime and a little camphor; it is made into a paste with water when employed. A cement for Derbyshire spar and china, etc., is composed of 7 parts of rosin and 1 of wax, with a little plaster of Paris; a small quantity only should be applied to the surfaces to be united, for, as a general rule, the thinner the stratum of cement the more powerful its action. Quicklime mixed with white of egg, hardened Canada balsam, and thick copal or mastic varnish are also used for cementing broken china, which should be warmed before their application. For small articles, shellac dissolved in spirits of wine is a very convenient cement. Cements such as marine glue are solutions of shellac, india-rubber, or asphaltum in benzine or naphtha. For use with wood which is

exposed to moisture, as in the case of wooden cisterns, a mixture may be made of 4 parts of linseed oil, boiled with litharge, and 8 parts of melted glue; other strong cements for the same purpose are prepared by softening gelatine in cold water and dissolving it by heat in linseed oil, or by mixing glue with one-fourth of its weight of turpentine, or with a little bichromate of potash. *Mahogany cement*, for filling up cracks in wood, consists of 4 parts of beeswax, 1 of Indian red and, yellow ochre to give colour. *Cutler's cement*, used for fixing knife blades in their hafts, is made of equal parts of brick-dust and rosin, melted, or of 4 parts of rosin with 1 each of beeswax and brick-dust. For covering bottle corks a mixture of pitch, brick-dust and rosin is employed. A cheap cement, sometimes used to fix iron rails in stone-work, is melted brimstone, or brimstone and brick-dust. For pipe-joints a mixture of iron turnings, sulphur and sal ammoniac, moistened with water, is employed. *Japanese cement*, for uniting surfaces of paper, is made by mixing rice-flour with water and boiling it. *Jewellers' or Armenian cement* consists of isinglass with mastic and gum ammoniac dissolved in spirit. Gold and silver chasers keep their work firm by means of a cement of pitch and rosin, a little tallow and brick-dust to thicken. *Temporary cement*, for lathe-work, such as the polishing and grinding of jewelry and optical glasses, is compounded thus:—rosin, 40z., whitening previously made red hot, 40z., wax, $\frac{1}{2}$ oz.

CEMENTATION, a metallurgical term which describes processes by which one substance is, by exposure to great heat in a furnace, caused to interpenetrate and change the character of another. Although a high temperature is employed, the process is not one of melting materials together, but of combining them through contact at a temperature which is below their melting-points. Thus, in the manufacture of blister steel by cementation, a rod of iron becomes steel because exposed at a temperature of about $1,000^\circ\text{C}$. to carbon which penetrates its substance. (See BLISTER STEEL; IRON AND STEEL.)

CEMETERY, literally a sleeping-place, the name applied by the early Christians to the places set apart for the burial of their dead. These were generally extra-mural and unconnected with churches, the practice of interment in churches or churchyards being unknown in the first centuries of the Christian era. The term cemetery has, therefore, been appropriately applied in modern times to the burial-grounds, generally extra-mural, which have been substituted for the overcrowded churchyards of populous parishes both urban and rural (see BURIAL).

From 1840 to 1855, attention was repeatedly called to the insanitary condition of the London churchyards by the press and by parliamentary committees, the first of which reported in 1843. The vaults under the pavements of the churches, and the open ground surrounding them, were crammed with coffins. Coffins were placed tier above tier in the graves until they were only just below the surface. To make room for fresh interments the sextons had recourse to the surreptitious removal of bones and partially-decayed remains. The neighbourhood of the churchyards was usually unhealthy. In all the large towns the evil prevailed more or less, but in London it forced itself more readily upon public attention, and after more than one partial measure of relief had been passed the churchyards were, with a few exceptions, finally closed by the act of 1855, and the cemeteries which now occupy a large extent of ground to the north,

south, east and west became henceforth the burial-places of the metropolis. Several London cemeteries had been established by private enterprise before the passing of the Burial Act of 1855 (Kensal Green cemetery dates from 1832), but that enactment forms the epoch from which the general development of cemeteries in Great Britain and Ireland began. Burial within the limits of cities and towns is now almost everywhere abolished,

BY COURTESY OF THOMAS F. LEE

COMMUNAL VAULTS, GUATEMALA

In these concrete walls with rows of receptacles for coffins, the remains of the dead are left intact so long as rent is paid. On failure to pay the rent, the bones are removed and buried in a common heap, and the "pigeon hole" is rented again.

and where it is still in use it is surrounded by such safeguards as make it practically innocuous. The increasing practice of cremation (*q.v.*) has assisted in the movement for disposing of the dead in more sanitary conditions; and the practice of burying the dead in more open coffins, and abandoning the old system of family graves, has had considerable effect.

In England a cemetery is either the property of a private company incorporated by Act of Parliament or of a local authority and is subject to the Cemeteries Clauses Act 1847, the Public Health Act, 1875 and the Public Health (Interments) Act, 1879. By S. 33 of the Burial Act, 1852, a burial board under such conditions as it thinks proper may sell the exclusive right of burial, either in perpetuity, or for a limited period, in grave spaces; the right of constructing any vault or place of burial with the exclusive right of burial therein in perpetuity, or for a limited period; and also the right of erecting and placing any monument, gravestone, tablet or monumental inscription. By S. 38 the general management, regulation and control of a burial ground is vested in the burial board. Regulations are made by the Minister of Health and Rules may be made by the board. By S. 44 of the Cemeteries Clauses Act 1847 the grant of the right of burial, whether in perpetuity or for a limited time, becomes the personal estate of the grantee. Under such a grant there is implied the right to visit the grave, and to plant shrubs and plants and to keep the surface in order, and if there is a monument, head or curb stones to keep them in repair (see *Ashby v. Harris* [1868] L.R. 3 C.P. 523). This case was discussed, but not overruled in *McGough v. Lancaster Burial Board* (1888) 21 Q.B.D. 323 where, in consequence of a rule of the board, made prior to the grant, prohibiting the placing of glass shades on graves, it was held that the grant of burial in a grave space to the plaintiff did not include a right to place a glass shade on his grave. Although a burial board cannot sell the freehold of a grave space, the property in a vault, tomb, monument, headstone, curb or any other erection remains in the person who erected them. See *Spooner v. Brewster* (1825) 3 Bing. 136 and *Sims v. The London Necropolis Co.* (1885) 1 T.L.R. 584; but see also *Hoskyns Abrahall v. Paignton U.D.C.* (1928) 2 Ch. (See J. B. Little, *Law of Burial*, 1902.)

UNITED STATES

In the United States cemeteries were the final outgrowth of individual burial places on the farms or near the homes of the earliest settlers. Later the burial place was connected with the church, which custom is not entirely obsolete. Prominent men were buried beneath the church building for a long time during

the 17th and 18th centuries, but the crowded conditions together with the fact that the practice was recognized as unsanitary caused it to be abandoned. In villages and small towns the church "graveyards" grew into disrepute many years ago because of the neglect they were subjected to. There was no provision for care of such burial places, except the slight attention a sexton would give, and disorder resulted. Detached cemeteries have been in use in the United States since 1831 when Mt. Auburn was established in Boston. Philadelphia soon after set up some notable large burial places and Greenwood in New York had its beginning in 1840. From 1860 churchyard burials have gradually been discontinued until to-day they are but exceptions to the rule of beautiful community cemeteries. From single burial plots on private property, to church graveyards, to cemeteries and now to "memorial parks" has been a notable transition.

During the days when cemeteries were maintained by and in connection with the church, members and their families were entitled to a burial site. No expense was attached to the burial except the cost of opening the grave. No funds were available for upkeep which accounts for the deterioration of the property, and the ultimate abandoning of that type. In the cemeteries of to-day lots are sold by the city or village, if owned by such a body, or by the association, which has charge. A definite fee is charged for perpetual care and a charge is made for opening the grave and

other duties performed by the sexton or superintendent. Generally speaking cemeteries are supposed to be maintained with no idea of profit, and that holds good in a great majority of places.

Some churches have their own cemeteries, though not in connection with the church, notably the Catholic church. The Jews have many beautiful burial sites, and now and then one comes across a cemetery maintained by one or another of the Protestant societies. Throughout the country there are many beautiful cemeteries maintained by the Masonic or other fraternities for their own members and members of their families. There are many

5. Talma's tomb in the Pere Lachaise cemetery, Paris
6. Graveyard of the Ages, in Canton, southern China

State and national cemeteries in the United States provided by statute, given over to the burial of departed army and navy men, and men connected with State institutions, usually attached to soldiers' homes or army posts.

CENACLE, the term applied to the eating-room of a Roman house in which the supper (*cena*) or latest meal was taken. It was sometimes placed in an upper storey. The Last Supper in the New Testament was taken in the cenacle, in the "large upper room" cited in St. Mark (xiv. 15) and St. Luke (xxii. 12).

CENCI, BEATRICE (chĕn'chĕ) (1577-1599), a Roman woman, famous for her tragic history, was born on Feb. 6, 1577, in the Cenci palace in Rome. She was the daughter, by his first wife, of Francesco Cenci (1549-1598), a vicious man of great wealth. He was tried in 1594 for sodomy, but was released on payment of a fine of 100,000 scudi. Cenci had 12 children by his first wife; his second wife, Lucrezia Petroni, a widow with three daughters, brought him no children. He was embroiled with his sons and after the trial he decided to remove his wife Lucrezia, with Beatrice, to La Petrella, a lonely castle on the road to Naples which he obtained from Marzio Colonna. There in 1595 he shut up his wife and daughter in the upper rooms of the castle, and there he visited them from time to time treating them, especially Beatrice, with great brutality. There is no evidence for the charge of attempted incest with his daughter, but the details of life at La Petrella, as given in the subsequent trial, were revolting, and might well have given colour to the accusation. Beatrice seems to have found refuge in a liaison with the keeper of the castle, Olimpio Calvetti. At intervals the two younger Cenci children, Bernardo and Paolo, visited La Petrella. Olimpio was expelled by Colonna from the castle at the demand of Francesco Cenci, who does not, however, seem to have known of his relations with Beatrice. At length, Beatrice, with her stepmother and with her brother Giacomo and Bernardo, decided to secure the murder of their father. He was killed in his bed (Sept. 9, 1598) by Olimpio and a hired assassin named Marzio.

Information having been communicated to Rome, the whole of the Cenci family were arrested early in 1599. Lucrezia, Giacomo and Bernardo confessed the crime; and Beatrice, who at first denied everything, even under torture, also ended by confessing. Great efforts were made to obtain mercy for the accused, but the pope (Clement VIII.) refused to grant a pardon; on Sept. 11, 1599, Beatrice and Lucrezia were beheaded, and Giacomo, after having been tortured with red-hot pincers, was killed with a mace, drawn and quartered. Bernardo's penalty, on account of his youth, was commuted to perpetual imprisonment, and after a year's confinement he was pardoned. The property of the family was confiscated. There is a study by Guido Reni or Guercino in the Palazzo Barberini said to represent Beatrice, but it is unlikely that Reni saw her.

The history of the Cenci family has been the subject of poems, dramas and novels. Shelley found in it material for his great tragedy. The most famous of the novels is F. D. Guerrazzi's *Beatrice Cenci* (Milan, 1872). The first attempt to deal with the subject on documentary evidence is A. Bertolotti's *Francesco Cenci e la sua famiglia* (2nd ed., Florence, 1879), containing a number of interesting documents which place the events in their true light; cf. Labruzzi's article in the *Nuova Antologia*, 1879, vol. xiv., and another in the *Edinburgh Review*, Jan. 1879. See also C. Ricci, *Beatrice Cenci*, 2 vols. (1923), where new documents and new information are to be found.

CENOBITES, monks who lived together in a convent or community under a rule and a superior—in contrast to hermits or anchorites who live in isolation (from Gr. *κοινός*, *common*, and *bios*, *life*). See MONASTICISM.

CENOMANI (Kĕn-ō-mah'nĕ), a branch of the Aulerci in Gallia Celtica, whose territory corresponded generally to Maine (department of Sarthe). Their chief town was Vindinum, afterwards Civitas Cenomanorum (whence Le Mans). They assisted Vercingetorix in the great rising (52 B.C.) with a force of 5,000 men. Under Augustus they formed a *civitas stipendiaria* (tributary community) of Gallia Lugdunensis. About 400 B.C., under the

leadership of Elitovius (Livy v. 35), a large number of the Cenomani crossed into Italy, drove the Etruscans southwards, and occupied their territory. The limits of their territory are not clearly defined, but were probably the Adige on the east, the Addua on the west and the Padus (Po) on the south. Their chief towns were Brixia (Brescia) and Verona. They assisted the Romans in the Gallic war (225 B.C.), when the Boii and Insubres took up arms against Rome, and during the war against Hannibal. They joined in the revolt of the Gauls under Hamilcar (200), but after they had been defeated by the consul Gaius Cornelius (197) they finally submitted. In 49 B.C., with the rest of Gallia Transpadana, they acquired the rights of citizenship.

Hülsen in Pauly-Wissowa's *Realencyklopädie*, iii. pt. 2 (1899); full ancient authorities in A. Holder, *Alt-celtischer Sprachschatz*, i. (1896).

CENOTAPH, a monument or tablet to the memory of a person whose body is buried elsewhere (Gr. *κενός*, empty, *τάφος* tomb). The custom arose from the erection of monuments to those whose bodies could not be recovered, as in the case of drowning. The term is often used of the monuments raised in many places in memory of those who perished on the field in the World War, especially of the cenotaph in Whitehall, London, the scene of an annual memorial service on the anniversary of Armistice Day (q.v.).

CENSOR. I. In ancient Rome, the title of the two Roman officials who presided over the census (from Lat. *censere*, assess, estimate), the registration of individual citizens for the purpose of determining the duties which they owed to the community. This idea of "discretionary power" was never entirely lost; although it came to be intimately associated with the appreciation of morals. The censorship was the Roman manifestation of the state control of conduct.

The office was instituted in 443 B.C. to relieve the consuls of the duties of registration. The election always took place in the *Comitia Centuriata* (see COMITIA). The censorship, although lacking the imperium, was one of the higher magistracies, and was regarded as the crown of a political career. It was an irresponsible office; and the only limitations on its powers were the restriction of tenure to a year and a half, and the restraint imposed on each censor by the fact that no act of his was valid without the assent of his colleague.

The original functions of the censors were (1) the registration of citizens in the state-divisions, such as tribes and centuries; (2) the taxation of such citizens based on an estimate of their property; (3) the right of exclusion from public functions on moral grounds, known as the *regimen morum*; (4) the solemn act of purification (*lustrum*) which closed the census. Two other functions were subsequently added: (5) the selection of the senate (*lectio senatus*, see SENATE), and (6) certain financial duties such as the leasing of the contracts for tax-collecting and for the repair of public buildings. The census involved a detailed examination of the citizen body as represented by the heads of families. In connection with this review the censors published their edicts stating the moral rules they intended to enforce. Disqualification might be the result of offences in private relations or in public life. Certain kinds of employment (e.g., acting) caused a stigma. *Infamia*, the general name for the penalties inflicted by the censors, varied in degree. A senator might lose his seat, a citizen his place in tribe and century, and so his vote. All disabilities inflicted by one pair of censors might be removed by their successors.

The censorship lasted as long as the republic; and it was only suspended, not abolished, during the principate. Although the *princeps* exercised censorial functions he was seldom censor. Yet the office itself was held by Claudius and Vespasian. Domitian assumed the title of life censor, but he was not followed.

BIBLIOGRAPHY.—Mommsen, *Römisches Staatsrecht* (1887), ii., 331, et seq.; A. H. J. Greenidge, *Roman Public Life* (1901); J. E. Sandys, *Companion to Latin Studies* (1921), with useful bibliography; W. E. Heitland, *Roman Republic* (1923).

II. In modern times the word "censor" is used generally for one who exercises supervision over the conduct of other persons. In the Universities of Oxford and Cambridge it is the title of the supervisor of those students who are not attached to a college, hall or hostel. In Oxford the censor is nominated by the vice-chancellor and the proctors, and holds office for five years; in Cambridge he is similarly appointed, and holds office for life. The censors of the Royal College of Physicians are the officials who grant licences.

Council of Censors, in American constitutional history, is the name given to a council provided by the constitution of Pennsylvania from 1776 to 1790, and by the constitution of Vermont from 1777 to 1870. Under both constitutions the council of censors was elected once in seven years, for the purpose of enquiring into the working of the governmental departments, the conduct of the state officers, and the working of the laws, and as to whether the constitution had been violated in any particular. The Vermont council of censors, limited in number to thirteen, had power, if they thought the constitution required amending in any particular, to call a convention for the purpose. A convention summoned by the council in 1870 amended the constitution by abolishing the censors.

For the censorship of the press, see PRESS LAWS; for the censorship of plays, THEATRE: Law, and LORD CHAMBERLAIN.

CENSORINUS, Roman grammarian and writer, flourished during the 3rd century A.D. He was the author of a lost work *De Accentibus* and of an extant treatise *De Die Natali*, written in 238, dedicated to his patron as a birthday gift and dealing with the natural history of man, the influence of the stars and geni, music, religious rites, astronomy and the doctrines of the Greek philosophers. The second part deals with chronological and mathematical questions and has been useful in determining the principal epochs of ancient history. The chief authorities used were Varro and Suetonius. Some scholars hold that the work is practically an adaptation of the lost *Pratum* of Suetonius. The fragments of a work *De Natali Institutione* are not by Censorinus.

The only good edition with commentary is still that of H. Lindenberg (1614); the most recent critical editions are by O. Jahn (1845), F. Hultsch (1867), and J. Chlodniak (1889). There is an English translation of the *De Die Natali* (the first 11 chapters being omitted), with notes by W. Maude (New York, 1900).

CENSORSHIP in modern practice may be generally defined as action taken by any governing authority to prevent the dissemination of false statements, inconvenient facts or displeasing opinions among the governed (for derivation and history see CENSOR above).

Censorship of Printed Publications.—In Great Britain almost entire freedom of the Press has existed since 1695—except in time of war. Milton's eloquent protest in his *Areopagitica* against the tyrannous censorship of the Long Parliament had no effect at the time; it had its effect after the Revolution. Since 1695 there have been no official restrictions except in so far as all publishers of criminal or injurious matter are answerable to the laws of libel and blasphemy and must comply with certain statutory requirements framed with a view to the identification of offenders (see PRESS LAWS). In 1771, however, the house of commons attempted unsuccessfully to prevent the publication of its debates; and in 1819 the tax of fourpence a copy on all periodicals (retained until 1836) amounted to a censorship of readers, if not of the Press.

In other European countries, control by Government of printed publications has in the past been almost universal. Its stringency has varied greatly according to the country and the time, but the right of Governments to attempt to control opinion has seldom been in serious question. Books have been freely suppressed, their authors fined and imprisoned, on such grounds as *lèse majesté*, and newspapers and periodicals have been subjected to a censorship, always political and military, and often religious and "moral" as well. Such a system was seen in full flower in Germany during the World War, and as censorships are generally stronger, because more necessary and more easily tolerated, in time of war, it may be well to describe it in detail. When war was declared the control of the censorship was transferred to the military command

and administered from the headquarters of the army corps districts into which Germany was divided. Every two or three days instructions were issued to the Press in every district on (1) what they were definitely forbidden to publish, (2) the attitude they were to take up with regard to certain questions, (3) inspired articles—often taken from other newspapers—which they were requested or given permission to reproduce.

The methods of exercising this Press censorship, which were much the same as those adopted in peace time, are typical of most censorships in highly centralized and bureaucratic countries. Editors were allowed to produce their papers without preliminary examination of proofs. If they transgressed any regulations they could be prosecuted and their paper suspended or placed under "preventive censorship." Except where purely military subjects were involved, it was impossible for an editor to escape responsibility by submitting his copy to the censor by way of precaution. "Preventive censorship" involved the submission of all proofs before they were passed for press. The censor was thus in a position to strike out all matter to which he objected, whether actionable or not. Generally no discussion of doubtful topics was allowed, no criticism of the Government and above all no criticism of the higher command. All information which might be of military value was excluded; though in spite of the efforts of the censors, much military information was obtained by the British War Office from the German Press. An organization was created in London to scrutinize all enemy periodicals, and a similar institution existed in Berlin. Both organizations were able to obtain much information from the indiscretions of the enemy Press.

A peculiar feature of the German censorship was the censors' insistence that the published periodical should bear no obvious traces of censorship. This was not so in the Allied countries, where most papers appeared daily either heavily *caviaré*, as it was called in Russia (*i.e.*, with paragraphs blacked out), or with large numbers of blank spaces. In Germany it was considered bad for *moral* that censorship should be so obvious.

In Great Britain a system was devised which first established a series of offences—communicating military information, spreading false reports or publishing statements likely to cause disaffection or to undermine *moral*—and then supplied a practical line of defence for editors and publishers against such charges by setting up an "Official Press Bureau" to which matter of doubtful legality or expediency could be submitted for "censoring" or for an official *imprimatur*. The Bureau, however, had no power to insist on submission to censorship and its *imprimatur* did not relieve an offender from the liability to prosecution. On the positive side, the Bureau issued from time to time secret instructions for the guidance and information of editors.

Dramatic Censorship.—The censorship of stage plays still surviving in Great Britain is one exception to the now vanished tyrannies which sought to regulate opinion in the mediaeval world. The theatre has in some way been controlled by authority in this country since the time of Henry VII., but the office of Licensor of Plays and the foundations of the present system of dramatic censorship dates from 1737. The Licensing Act of that year was the direct result of Henry Fielding's attacks on Walpole at the Little Theatre in the Haymarket. It prohibited under a penalty of £50 for each performance the acting for gain of any play or theatrical performance not sanctioned by letters-patent from the Crown or licensed by the lord chamberlain. Lord Chesterfield in his speech on the bill pointed out that there were already remedies at hand for the abuses at which it was aimed, and declared that the powers with which it was proposed to invest the lord chamberlain were more absolute than those of the monarch himself. The "Examiner of the Stage" then appointed had in practice little to do for the age was not squeamish and the theatrical world was entirely taken up with the fight for freedom of enterprise against the two "patent" houses, Drury Lane and Covent Garden. In 1832 the chairman of a royal commission appointed to examine the situation was strongly against the continuance of the office of Licensor of Plays, but of the 15 witnesses examined ten were in favour of retaining the censorship and only five against it. Ten years later, the Theatres Act of 1843 at last defined the lord chamberlain's

powers as a licenser of plays, and he was forbidden to withhold his license unless "he shall be of opinion that it is fitting for the preservation of good manners, decorum or of the public peace so to do." Twenty-one dramatic authors of note petitioned for the abolition of the censorship in 1865, but a select committee of both Houses in 1866 recommended no change. In 1907—there had been much intermediate agitation—71 authors joined in a letter of condemnation of the censorship which they sent to the *Times*. They included Meredith, Swinburne and Hardy and their language did not err on the side of mildness. As a result another select committee was appointed and reported in 1909. The central feature of the scheme they proposed was that "it should be optional to submit a play for license and legal to perform an unlicensed play, whether it had been submitted or not."

Since that time the question has found a working solution by the appointment of a representative committee of arbitrators to which the lord chamberlain can refer any play about which any doubt appears to exist in his own mind or in that of his reader. Pragmatically regarded, the censorship may be said to have justified itself; and the lord chamberlain's licence is probably generally preferable to the mercies of ignorant watch committees and an uninstructed police. The examiners during the 19th century were Larpent, George Colman the younger, Charles Kemble, John Mitchell Kemble, William Smyth-Pigott and G. A. Redford. Larpent was easy-going, Colman a little ridiculous because of his exaggerated notions of decency; but the Kembles and Smyth-Pigott were men of letters and men of tact and manners, well acquainted with the world they lived in. Redford was very much out of place and it was largely the *gaucherie* with which he carried out his duties that led to the protest of 1907. His successors have given critics of the office little ground for complaint.

Religious Censorship.—It would be a mistake to suppose that religious censorship has ever been confined to one section of avowed Christians. But the Roman Catholic Church having at many times asserted its authority regarding the temporal as well as the spiritual welfare of Christians, has naturally worked out its own system of censorship through the ages *pari passu* with the secular censorships of national States. The *Index Librorum Expurgandorum* (or *Prohibitorum*) is published by papal authority as a catalogue of printed publications prohibited to professing Christians whether on doctrinal or moral grounds. In the past there have no doubt been other grounds of prohibition. The first Roman Index was undertaken at the Council of Trent, and when it could not be completed was handed over to Pius IV., who published the first complete list of prohibited books in 1564. Books named in the Index may be either absolutely condemned or prohibited until they have been "corrected." In modern times it has been found quite impossible for the Congregation of the Index to keep pace with the output of the printing presses of the world, but on the other hand there already exist general rules regarding the use of books which the positive prohibitions of the Index are only intended to supplement.

WAR CENSORSHIPS

The outbreak of the World War in 1914 necessitated censorships from a purely military point of view in all belligerent countries, to deal with (1) postal communications; (2) telegrams and wireless communications; (3) printed publications. With (3) we have already dealt above.

Postal Censorships.—In peace time censorship of letters and cables is comparatively uncommon, though even in such a country as England the Home Office may empower the postmaster general to seize and open specified correspondence while it is in his hands. In war time, however, postal censorships were almost universal. In most of the armies field censorships were established to deal with the correspondence of the combatant forces. The censoring was performed in the area of military operations by regimental officers, or if necessary at the base by staff officers specially appointed for the purpose. In Great Britain only such letters arriving from the area of military operations as appeared to have escaped the eyes of the field censors were submitted by the post office for scrutiny to the censors in London.

This part of the censorship's activities was really a part of the *contre-espionnage*, a service designed to defeat the enemy's attempts to extract useful information from behind the lines. Such services were general in all belligerent countries, and necessitated a strict examination of any suspicious documents which might convey, by the use of cipher, code, sympathetic ink or any other device, a message to the enemy. In the British, French and German postal censorships special branches were organized to deal with these problems, and as a result many enemy agents were apprehended and enemy channels of communication closed. In Great Britain arrangements were made by which communications intended for enemy persons might be placed in open envelopes and enclosed in covers addressed to a neutral country. All such letters were submitted to examination. Mails for neutral countries contiguous to the enemy were censored from the first, and as the area involved by the War extended, it became necessary to examine practically all outgoing mails. Communications obtained from known enemy agents were in many cases altered so as to convey false information and then allowed to proceed. Printed publications emanating from enemy sources and found in postal packets were often of a highly propagandist nature, and were therefore seized and condemned. Others, less objectionable, were condemned because of the extreme ease with which secret communications can be made (by code and derivation) through printed matter and the difficulty of detecting such messages. Certain neutral publications were placed on a "black list" and destroyed whenever found.

In other belligerent countries the methods adopted were sometimes more radical and based on the principle that no correspondence can be dangerous which the addressee never receives.

Cable Censorship.—The position of Great Britain gave her a valuable control over enemy communications by cable. A cable censorship was established at the beginning of the War under a military chief responsible to the Army Council. The action taken by the censors, however, was based on the International Telegraph Convention of 1875. Great importance was attached to commercial cables. The principle adopted was purely to withhold, as far as British cables were concerned, all facilities for carrying on trade with an enemy country. In spite of much neutral protest the British policy was upheld and shown to be in accordance with the International Convention. Trade cables often contained military, and especially naval, information. (W. E. BAR.)

Irish Free State Film Censorship.—The Censorship of Films Act (1923) established the office of Official Censor of Films, the holder to be appointed by the Minister of Home Affairs. No film can be exhibited in public until it has received a certificate from this official. For certain kinds of films a limited certificate may be issued authorizing the showing of the picture under certain restrictions (which must be expressed on the certificate). The Act also established a Censorship of Films Appeal Board of nine commissioners appointed in the same manner to which the film-renter may appeal a decision of the Censor. No official censorship of the press, literature or the stage is provided for.

THE UNITED STATES

Preventive censorship, or the examination before publication of some form of communication (book or periodical, theatrical presentation, moving-picture or radio broadcast) by an official licensing agency with power to approve, change or suppress the offering has not been a characteristic American method of controlling the public mind or morals. Freedom of communication has generally been limited by the police power, acting after publication, to protect the State, public morals or public peace. Such police interference has been called punitive censorship, for the fear of punishment often acts as a deterrent to publication.

Censorship in the American Colonies.—Preventive censorships have existed from Colonial days to the present. The first printing-press (Cambridge, 1639) was licensed by the Massachusetts theocracy. Religious books were censored until 1695; and after that special manuscripts were submitted to authority. The Crown governors acted as licensors; and from 1686 to 1730 were instructed in their charters that "no book, pamphlet or other matter be printed without your especial leave and consent." The

first newspaper, *Publick Occurrences*, Boston, 1690, was suppressed after one issue. "Published by Authority" appeared on newspapers until about 1725. Since, pre-publication censorship has existed only in war-time. The trial of John Peter Zenger, publisher of the *New York Journal* in 1734, ended one kind of post-publication control by establishing the right of the jury to determine not only the fact of publication, but whether the words constituted a libel. The judge had hitherto claimed this dangerous prerogative. Since 1776 the State Constitutions have almost universally guaranteed freedom of the press. In 1791 the First Amendment to the Constitution of the United States declared: "Congress shall make no law . . . abridging the freedom of speech or of the press." This ended all censorship. The courts agreed with the narrow dictum of Blackstone: "The liberty of the press consists in laying no previous restraints upon publications, and not in freedom from censure for criminal matter when published." Liberals have maintained that this is a foolish and unhistoric interpretation since the censor had disappeared from the colonies about 1725-30, and that the clause meant a much larger freedom, with protection from post-publication punishments unless the publication could be proven a clear and imminent danger to the State or public morals. The extreme libertarian holds that communications may be punished only when they cause an overt act since no other objective criterion of their psychological tendency can be found. The courts have generally accepted the conservative Blackstone view (*see Patterson v. Colorado, 205 United States 454*).

Military Censorship.—War has generally re-established some principle of censorship. During the flurry with France in 1798, the Federalist party passed the Sedition Act, which provided punishments for publications, oral or printed, that reflected on the Government, promoted sedition or resistance to law. About ten persons, chiefly Republican editors, were convicted. The issue defeated the Federalists in 1800, and the law lapsed, without interpretation by the Supreme Court. President Jefferson released every person under punishment or prosecution. During the Civil War (1861-65) the postmaster general barred from the mails several Northern periodicals opposed to the war. Certain editors were imprisoned on the mere order of the secretary of State or of War. Newspaper offices in Missouri, Chicago and New York city were actually seized by troops, and issues of papers suppressed. Certain correspondents had to submit articles to the military for approval. Telegraphic dispatches were censored in Washington. In Colorado, 1904, and West Virginia, 1912, State militia under so-called martial law arrested editors, or suppressed and censored labour newspapers during strikes. In the World War the press established a voluntary censorship. Informal control was exercised through a governmental instrument, the Committee on Public Information. The newspapers, press associations and other organizations co-operated to prevent the disclosure of military or naval information, or matter calculated to weaken public morale. Strict military censorship was applied to news from correspondents with the American forces abroad. Foreign language periodicals in the United States were regulated by the Trading with the Enemy Act (United States Compiled Statutes, 1918, 3,115½ j.) and had to file English translations. The Department of Justice declared, however, that the constitutional right of free speech existed in war as in peace.

The Postal Censorship.—The so-called "postal censorship" is based on the power of the postmaster general to deny the second-class mailing-privilege to publications that contain matter forbidden by certain Federal statutes. The idea was born in 1835 when Southern representatives in Congress tried to pass a law forbidding Federal postmasters from distributing "incendiary" matter advocating the abolition of negro slavery in States that had banned such agitation. The law failed of passage, but in fact Southern postmasters never delivered Abolitionist papers. In the Civil War, a Congressional committee upheld the postmaster general's power to bar recalcitrant northern journals from the mails. In 1868 lottery information was forbidden the mails by law; and in 1873 the famous "Comstock Law" against obscene matter and contraceptive information was passed. This has pro-

duced many prosecutions and punishments. Later, matter furthering frauds, or the sale of alcoholic liquors, or advocating criminal anarchy was proscribed by statutes. The final extension came during the World War when Title XII. of the Espionage Act of June 15, 1917 made non-mailable any matter violating these specifications in Title I:

(i.) making false statements or reports with intent to interfere with the operations or success of the armed forces of the United States; (ii.) wilfully causing or trying to cause insubordination, disloyalty, mutiny, or refusal of duty in the armed forces; (iii.) wilfully obstructing the recruiting or enlistment services of the United States.

Heavy penalties (fine or imprisonment) were to be imposed on those attempting to use the mails for these purposes. The Sedition Act, May 16, 1918, added nine other specifications, such as, obstructing the sale of United States bonds; publishing language intended to cause scorn or contempt for the Government, Constitution, flag or uniform; urging curtailment of the production of war needs. The postmaster general could act on "evidence satisfactory to him." Under these acts, the mailing-privilege was denied to one or more issues of two Socialist dailies, to many Socialist and radical magazines and even journals of liberal opinion. Periodicals had their second-class privilege absolutely suspended. Books and pamphlets were barred. More than 100 publications were interfered with to some degree—the widest interference with the press in the nation's history.

The Courts have always held that these statutes do not limit freedom of the press and refuse to review such exclusions as they are held legitimate exercises of an executive function. The post office avoids the position of a censor by refusing to define objectionable matter in advance. The liberal view holds that since the Government enjoys a postal monopoly, the publication denied this preferential rate (granted publications to encourage the dissemination of knowledge) cannot compete with those enjoying the privilege.

Censorship of Motion Pictures.—Limited control over motion-picture films is exercised by the Federal Government through inter-State commerce acts. Films of prize-fights cannot be imported into the United States or transported from State to State. Section 245 of the Penal Code (Revision of June 5, 1920) forbids the transportation of films described as "lewd, obscene, lascivious or filthy." The difficulties of enforcement have made this law a dead letter. Under the war power in 1917 a Federal court ordered the seizure of a film titled, "The Spirit of '76," in part showing Paul Revere's ride on the ground that it might deter people from co-operating with Great Britain. Proposals to establish a Federal Board of Censors in the Bureau of Education have all been defeated.

Preventive censorships exist in seven States—Pennsylvania (1911), Ohio (1913), Kansas (1914), Maryland, Virginia, New York and Florida. The boards, usually composed of three salaried "well-qualified" persons, pre-view all films for public exhibition and may forbid their showing, delete scenes or titles or order their revision. The Supreme Court has declared such censorships constitutional. The National Board of Review is a non-official voluntary organization, supported by fees from film producers, that pre-views about 98% of the films produced. Its rules are more tolerant than the elaborate codes of the non-permissible drawn up by State boards, and its prime purpose is education by publicity for good films. Municipalities control motion-pictures through police-powers, especially that of revoking theatre licenses. In a few cities boards pre-view and censor films. The danger of these censorships is shown by the fact that Maryland bars scenes or titles "calculated to stir up antagonistic relations between labor and capital"; while Pennsylvania bans "whatever reflects upon national fame, patriotism or self-respect, or adversely affects international relations; attacks or renders ridiculous public institutions . . . or constituted authority."

Censorship of Radio Broadcasting.—No psychological censorship of radio broadcasting exists. The Federal Radio Commission and certain departments that control radio communication under interstate, international and military powers, exercise a kind of blanket censorship through their power to issue or revoke

station licenses. The commission allocates wave-lengths and time on the air, generally on technical grounds, but sometimes on the ground that matter broadcast is not justified by its public service. Labour and socialist organizations have claimed they were discriminated against; and the problem of securing non-partisanship in political advocacy has arisen in campaigns. The obscenity and sedition questions have not arisen. The private stations demand that material be submitted in advance for approval; and at times cut off the air personal or controversial remarks. Freedom of the air certainly presents grave problems, especially in its international significance.

Censorship of Plays and Books.—No censorship of the theatre of any importance has ever existed in the United States. Interference with the stage has been by police action after public performances. Prosecuting officers and police have on complaint received viewed exhibitions, and sometimes ordered them to be withdrawn or amended; in some cases they have prosecuted producers and even actors under State or local morality laws, and secured convictions resulting in fines or jail sentences. An amendment to the New York statute (1927) adds matter dealing with sexual perversions to obscenity, and provides the additional penalty of padlocking the theatre for not over one year. The theatre-owner thus becomes the real censor since he dare not risk the loss of his valuable license, even for art's sake. An unofficial viewing jury of 12 citizens drawn from a representative panel of 500 was tried in New York city, the district attorney agreeing to abide by their decision. The plan was abandoned.

The chief interference with books has been under the postal law or local morality ordinances. The New York Society for the Suppression of Vice has acted as prosecuting agent against pornography under both laws, and on occasion forced the conviction and withdrawal of books of admitted literary worth. In Boston, the Watch and Ward Society of New England by official agreement with the prosecutor's office, acted as censor by listing for book-sellers the books for the sale of which they might be prosecuted. These volumes were banned. Dissatisfaction forced the police to undertake their own censorship under which in 1927-28 over 50 volumes were proscribed, although many were sold freely everywhere else in the United States.

CENSUS. In modern usage, primarily denotes the periodical survey of the number and condition of the people—more fully described as "census of population" where necessary to distinguish it from the census of production, census of agriculture and similar institutions.

History.—Numberings of the people and national stocktakings are known to have been conducted from very ancient times. The Old Testament records the enumeration at the Exodus of the fighting strength of the Children of Israel and of the non-military Levites, and the famous enumeration of fighting men, conducted by Joab at the command of David, on which the divine wrath was visited. Records survive of a complete cadastral survey and census of Babylonia comprising agriculture, stock and produce, which appears to have been carried out for fiscal purposes in the third millennium B.C., and in the Persian empire, in China and in Egypt similar surveys are known to have taken place for the assessment of fiscal, military or labour liabilities. A most notable example was the Roman census, from which the modern institution derives its name: under this system the members and property of every family were enumerated quinquennially for the purpose of determining their civil status and corresponding liabilities. Dating from pre-republican Rome, the Roman census was extended by Augustus in 5 B.C. to the Roman empire and thus covered the whole of the civilized world of those times. The Roman census perished in the wreck of the Roman empire. Feudalism may have rendered the revival of census-taking, even when practicable, less necessary; and superstition may have contributed to its abeyance. The Christian Church remembered the

punishment of Israel; and even in the British House of Commons in 1753 it was possible for the fear to be expressed that a numbering of the people would be followed by "some great public misfortune or epidemical distemper." It is, of course natural that objections to taxation or military service should assume the cloak of religious scruple; but there must have been more than this. It is impossible not to infer that in the Old Testament story and in the purificatory sacrifice concluding the Roman census folk-memory lingered of a primitive *taboo*. And these speculations receive interesting support from the announcement, in connection with the Kenya census of 1926, that the authorities anticipated trouble with certain tribes among whom there was a strict *taboo* against counting either themselves, their wives or their cattle.

Thus, apart from undertakings such as Charlemagne's Breviary and the English Domesday Book (an inquest upon geld assessments) there was a long interval in census history until the mid-17th century, when a periodical census of the modern type was instituted in La Nouvelle France (Quebec) and Acadie (Nova Scotia). Enumerations of population took place in several of the German States from 1742 onwards, in Sweden in 1748, Denmark in 1769 and Spain in 1787. In Great Britain, after proposals had been made and defeated in 1753, the census was definitely established in 1801. From these and similar beginnings in other countries the institution of the census rapidly gained a permanent place in the organization of nearly all modern States, the most recent convert being Turkey in 1927. It will be seen that the precursors of the modern census were almost wholly executive operations discharging essential functions of government such as military recruitment and taxation. But in the long interval which preceded the revival these functions cut for themselves other channels of administration; and when inquests and surveys upon a national scale were again resumed it was with a very different object, viz., to supply knowledge for the guidance of public policy and to "substitute certainty for conjecture" upon the vexed questions of fact which are vital to political action and foresight.

CONCEPTION AND EVOLUTION OF MODERN CENSUS

The census, as now conceived, has two main objects. It provides an instantaneous picture of the community—a cross-section of the body-politic exhibiting its constitution at the point of time when it is made. It thus affords knowledge of numbers and conditions which is valid for the particular point of time and, with approximations, for adjacent periods. But all things are subject to change; and knowledge of the force and direction of changes in the community are even more important than the facts at any given date. A single sounding will disclose what depth of water is below the keel; but not without repeated soundings is it known whether the water is shoaling, and how rapidly. Hence in the modern census each enumeration is conceived not only as a source of static knowledge but as an item in a consecutive series. From the succession of these alone can be ascertained and measured those great drifts and currents in the national life which, whether deemed good or evil, whether resistible or irresistible, must at least be known and reckoned with.

House to House Visitation.—The first among the questions upon which certainty was deemed requisite was the number of the population. Such a numbering entails a house-to-house visitation coupled with enquiries of the inmates. This process (primitive, but not to be bettered) affords opportunities, on the one hand, and imports limitations on the other, which have substantially determined the scope and evolution of census-taking. In the first place, the itinerary may be planned so as to group the dwellings visited according to any designed arrangement of boundaries: thus information obtained respecting the population of each areal group may be separately recorded and becomes available, not only as a component part of the national total, but also by itself, or as a component part of larger areal units, for the purpose of exhibiting the local distribution of that total. Further, the need to ensure that no dwelling is omitted leads to a record being made of all premises on the itinerary. It is but

a step to include particulars of each dwelling, e.g., whether inhabited or vacant, and the number of its rooms, thus affording, in combination with other material, statistics as to housing conditions, overcrowding, etc. The convenience of obtaining particulars from one spokesman on behalf of each family or household leads to a system of household returns which themselves afford a count of such families. But the germ of the fertile elaboration of census enquiries is to be found in the fact that the information is obtained by direct enquiry of the persons concerned, thus permitting of the inclusion of every subject on which the individual can reasonably be expected to state his own position and that of his dependants. Age may be asked and given: the relationship and marital status of persons comprised in the household group can be described. Birthplace and nationality may be stated. A further group of personal particulars has furnished a great body of statistical material relative to occupation and industry. Every occupied person can state his job in terms which permit of precise occupational classification. And in addition to stating that he is, for example, a crane-driver, he can add that he is employed by a firm of brewers, thus enabling himself to be classed to the industry which he serves. Other enquiries are regularly included where the conditions render them suitable, such as religion, language spoken and literacy. Comparatively complicated enquiries may be included such as the "fertility of marriage" enquiry in English, French, Netherlands, Spanish and Norwegian censuses (date of marriage: number of deceased and number and ages of living children of the marriage).

The Personal Aspect.—The common element in all these enquiries is that they are personal. It has been suggested that the whole field of statistics can be viewed as concerned with either *personnel* or with *material*: this is not an entirely watertight division, but it accurately represents an important difference between the main points of view from which statistical information is sought and studied. The census as an instrument for the collection of information is predominantly concerned with aspects of *personnel*, and covers the major portion of that province. It is unable to elucidate any subject except as an attribute of the individual man or woman. The inclusion of agricultural statistics in some countries is an apparent exception: but such enquiries may be in a sense an extension of the record of dwellings. The homestead is visited; it is noted that so many acres of arable, etc., are annexed and that there is stock of a certain kind and number. This is consistent with the census procedure, which must locate as it counts: it cannot deal with wealth which is everywhere and nowhere. Subjects such as exports and imports are clearly out of the picture. But there are some limitations in the field of personal attributes. The enquiry must be capable of being simply put and answered. Intrinsically there is nothing to prevent the use of the census to ascertain the distribution of the national wealth or income; but the preparation of a statement in the form necessary to furnish the answer upon a uniform basis would be beyond the power of most individuals. If all particulars needed for the calculation were asked they would need a census schedule to themselves; and if the final figure alone were to be given there would be no security that it was properly arrived at. An enquiry of all wage-earners as to the rate of pay received (as in the Spanish census) would not be subject to the same objection.

Difficulty of Verification.—But in many countries another general limitation would apply. Census returns cannot be verified, in view of the magnitude of the operations; and it is useless to make any enquiry respecting which individuals may have any conscious motive, real or fancied, for suppressing or distorting the facts. Hence information which in the popular apprehension might be used by the authorities for enforcing individual liabilities, such as taxation, cannot profitably be asked; and truthful information upon subjects, such as illegitimacy, which are felt to be delicate is often unobtainable owing to a fear of it becoming public. These considerations have tended to emphasize the character of the modern census as a source of abstract statistical information only. Whatever expectations may have been formed in the early days of the census revival as to its incidental utility

for executive purposes, census administrators have had to choose between making it an effective instrument for the collection of statistics only and making the worst of both worlds. Another minor limitation applies to the doubtful ability of the individual to give reliable answers to enquiries as to infirmities such as blindness, deafness, etc. Even if no bias due to prejudice arises, the terms employed are unavoidably indefinite; and the conditions themselves cannot be properly assessed save by trained medical judgment. It is becoming recognized that the census can afford little assistance of value in this sphere.

Advantages.—Within limitations the census has the peculiar and enormous advantage that all the varied attributes which it records are related to the individual to whom they jointly belong. Hence every type and class of information obtained can be presented in combination with every other type and class. If it be assumed, for the sake of illustration, that the collection of occupational data is omitted from the census and separately organized by means of returns from employers, information might still be forthcoming of the number of metal spinners, while the census would continue to state the number of men aged 49. But between the two sets of figures there would be a gulf; it would be impossible to obtain the number of metal spinners aged 49. Given, however, the inclusion of both enquiries in the census any combination of these and other results is possible; and a census enquiry, as distinct from one separately promoted, not only affords the desired information but adds a fuller and richer significance to all those which it supplements.

Utility of Census.—And as the scope of the census has expanded, so the sphere of its utility has been enlarged. It still discharges its original function as an intelligence service of the government by which it is promoted in both legislation and administration. Estimates cannot be framed, for example, of the money provision requisite in future for the payment of old age pensions, or of the school provision needed for the rising generation, without the help of census material. Social insurance schemes equally rely upon such material for their actuarial foundation. Electoral redistribution must be largely based upon population distribution; in South Africa constituencies are rearranged on the results of each census. Census statistics are the common tools and material of the business of government in ways too numerous to detail; but they are equally indispensable to the direction of State policy. In matters of defence the most pacific nation cannot afford not to know where it stands and whither it is tending. Questions of unemployment cannot begin to be considered without a knowledge of the industrial disposition of the people. Policy respecting migration still depends upon a recognition of the forces of population pressure which have so often changed the face of history. Knowledge of all these facts, even where not directly contributing to the solution of the problems of statecraft or state-policy, nevertheless forms a background against which they must be viewed. And for the public service in its widest significance the census provides material for research and study, helping to define and clarify the issues on the great questions to which there is as yet no agreed answer, and which, so far from having been admitted within the sphere of government responsibility, are but vaguely stirring in the conscience of the community. Not among the least of the services of the census is that which it renders to statistical method whereby, for example, mortality data may be converted into mortality rates, thus eliminating variables and reducing to a comparable basis a wealth of material which for many purposes would otherwise be useless.

CENSUS METHOD AND PRACTICE

Within the essential framework of the census system—house-to-house visitation coupled with enquiries—diversities in national practice are for the most part of little moment. But in one case, at any rate, a question of method is also a question of principle. Populations are represented in some countries *de jure*, in others *de facto*. A *de facto* enumeration, following the principle of the instantaneous picture, allocates individuals to the areas in which they are physically found at the census date, regardless

of their usual residences. A *de jure* distribution, on the other hand, is that which assigns the population to the respective areas of usual residence. Where populations are immobile, one set of figures serves both purposes: but in most industrially developed countries there is much, and increasing, population movement. It is usual in *de facto* enumerations to select a census date which so far as possible avoids population movement and on which *de facto* thus approximates to *de jure*: otherwise a *de facto* distribution is apt to be fortuitous and meaningless. But *de jure* as a norm is not valid for all purposes. What, after all, is the population of Blackpool? The number of its permanent winter residents, or its doubled or tripled complement of the holiday season upon whom so much of its existence and conditions depends? The great daily migrations between home and workplace raise a similar question: what, it may again be asked, is the population of the City of London—the 13,000 night residents, or the 400,000 who spend there a third of the most active portion of their lives? The truth is, of course, that there is no one answer: the purpose to be served determines the choice. But it will be clear, at any rate, that the meaning of the term "population" admits of some refinements.

Typical Systems.—The following outline will afford an indication of the scope and salient features of a few typical census systems. The English census has been hitherto decennial, though quinquennial powers are now available. The return is made by the householder, the enumeration being *de facto*. The schedule (1921) includes name, relationship to householder, age, sex, marital condition, orphanhood, birthplace, nationality, school attendance, occupation, industry, industrial status (whether employer, employee or working on own account), place of work, and number and ages of living children and stepchildren under 16.

France.—In France the census is quinquennial: a skeleton household return is made by the householder, supplemented by a separate return by each member. The former includes absent members and distinguishes temporary residents, thus providing for a *de jure* distribution. The individual schedule (1921) requires name, sex, date and place of birth, nationality, marital condition, date of marriage, number of deceased and number and ages of living children of the marriage, usual residence (if temporarily present), literacy, and principal and secondary occupations, together with particulars of principal industry, industrial status, number of employees, or if employee, whether unemployed.

Italy.—In Italy the regular census is decennial: the return, which is made by the householder, includes particulars as in France for a *de jure* distribution. The schedule (1921) requires name, father's name (and whether alive or dead) relationship to householder, sex, date and place of birth, marital condition, literacy, principal and secondary occupations, whether owning property (distinguishing land and buildings), and nationality.

Germany.—Germany affords an interesting example of a quinquennial census of alternately greater and lesser scope. In 1919 the schedule comprised (apart from special post-war enquiries) name, relationship to householder, sex, date of birth and marital status, with the distinctions requisite to provide a *de jure* distribution. In 1925 these enquiries were supplemented by religion, nationality, mother tongue, last residence before the World War, principal and secondary occupations and industry and industrial status. The return is made by the householder.

Population Registers.—As seen in the foregoing examples, the frequency of the census series is usually decennial or quinquennial: the latter is generally deemed desirable on statistical grounds, but the census is an expensive and laborious undertaking. The attractive prospect has at times been indulged of the creation of population registers, containing in respect of each individual the particulars usually elucidated by the census, and accurately maintained, as a mirror of the people and of the passing phases of their lives, by reports of all changes in the personnel or in the particulars recorded about them. Given such registers, it has been urged, a census of the written records could be taken at any time, however frequent, to ascertain the current position regarding all or any of the recorded particulars

without the labour and expense of the census visitation. The prospect, though attractive, is hardly realizable. Were it the case that all the requisite information is already available through one channel or another, nothing would be needed but their complete co-ordination for the maintenance of the registers. But in all countries there are great gaps in the essential information which could not be filled without a revolution in national habits or administrative machinery. Maintenance of the occupational and industrial record, for example, would involve a duty to notify change of occupation or employment in the case of every individual. Maintenance of accurate particulars as to local distribution would involve an obligation to report every change of address.

Population registers with a limited scope exist in some countries, such as The Netherlands, Belgium and Sweden; and many systems of public supervision require the registration of residence, arrival and departure. But such countries do not dispense with a census, and it seems doubtful whether removals are notified with sufficient completeness for statistical purposes. It will be clear that in Great Britain, at any rate, and in other countries similarly situated, the proposition would impose upon every individual a host of new obligations which though trifling in themselves would not be discharged without legal enforcement, and which, for want of sympathy with their purpose, would appear meaningless and oppressive. Such a system even if practicable would not be less laborious and costly than the census: it would be rigid, moreover, and lacking the valuable capacity of the census proper to experiment in new methods and new fields of enquiry on each successive occasion.

But while the census remains indispensable, the essential element of value in such proposals is well recognized, viz., the co-ordination of all continuously available demographic material, such as that of vital registration, with the periodical census results. The census population of a given date may be corrected by allowance for births and deaths over any subsequent period to show the population at a later date as modified by net natural increase or decrease. Allowance for the remaining factor of migration is necessary to complete the adjustment; and, given adequate records of migration, a population figure may thus be constructed which is as correct and authoritative as any census product. The process could be carried into further detail were the migration records fully complementary to the registration data. But if inadequate for the construction of fully authentic intercensal statistics, the supplementary sources are invaluable in the framing of estimates to bridge the intercensal gap. Vital registration is closely related to the census both in subject-matter and through their association for joint or mutual service; and cannot be ignored in any study of the census system.

See POPULATION, OCCUPATIONS, BIRTH RATE, DEATH RATE AND MARRIAGE RATE; see also official census publications of the respective national governments (census of Commonwealth of Australia 1911; vol. i.: Statistician's report contains extensive commentary on census history and practice) and League of Nations series of "Statistical Handbooks" dealing with the official vital statistics of various countries. (S. P. V.)

UNITED STATES

The Federal census, which began in 1790 and has been taken every ten years since under a mandate contained in the U.S. Constitution, was the outgrowth of a controversy in the convention which prepared the document. Representatives of the smaller States as a rule claimed that the vote, and so the influence, of the States in the proposed Government should be equal. Representatives of the larger States as a rule claimed that their greater population and wealth were entitled to recognition. The controversy ended in the creation of a bicameral legislature in the lower branch of which the claim of the larger States found recognition, while in the upper, the Senate, each State had two votes. In the House of Representatives seats were to be distributed in proportion to the population, and the convention, foreseeing rapid changes of population, ordained an enumeration of the inhabitants and a redistribution or reapportionment of seats in the House of Representatives every ten years.

The provision of the Constitution on the subject is as follows:

Representatives and direct taxes shall be apportioned among the several states which may be included within this Union according to their respective numbers, which shall be determined by adding to the whole number of free persons, including those bound to service for a term of years and excluding Indians not taxed, three-fifths of all other persons. The actual enumeration shall be made within three years after the first meeting of the Congress of the United States, and within every subsequent term of ten years, in such manner as they shall by law direct.

In 1790 the population was reported classed as slaves and free, the free classed as white and others, the free whites as males and females, and the free white males as under or above sixteen years of age. In 1800 and 1810 the same classification was preserved, except that five age-groups instead of two were given for free white males and the same five were applied also to free white females. In connection with the census of 1810 an attempt was made to gather certain industrial statistics showing "the number, nature, extent, situation and value of the arts and manufactures of the United States." In 1820 a sixth age class was introduced for free white males, an age classification of four periods was applied to the free coloured and the slaves of each sex, and the number of aliens and of persons engaged in agriculture, in manufactures and in commerce was called for. The inquiry into industrial statistics begun in 1810 was also repeated and extended.

In 1830 13 age classes were employed for free whites of each sex, and six for the free coloured and the slaves of each sex. The numbers of aliens, of the deaf and dumb, and the blind were also gathered.

The law under which the census of 1840 was taken contained a novel provision for the preparation in connection with the census of statistical tables giving "such information in relation to mines, agriculture, commerce, manufactures and schools as will exhibit a full view of the pursuits, industry, education and resources of the country." This was almost the first indication of a tendency, which grew in strength for half a century, to load the Federal census with inquiries having no essential or necessary connection with its main purpose, which was to secure an accurate enumeration of the population as a basis for a reapportionment of seats in the House of Representatives. This tendency was largely due to a doubt whether the Federal Government, under the Constitution, possessed the power to initiate general statistical inquiries, a doubt well expressed in the 9th edition of the *Encyclopædia Britannica* by Francis A. Walker, himself a prominent member of the party whose contention he states:—

The reservation by the states of all rights not granted to the general government makes it fairly a matter of question whether purely statistical inquiries, other than for the single purpose of apportioning representation, could be initiated by any other authority than that of the states themselves. That large party which advocates a strict and jealous construction of the constitution would certainly oppose any independent legislation by the national Congress for providing a registration of births, marriages and deaths, or for obtaining social and industrial statistics, whether for the satisfaction of the publicist or for the guidance of the legislature. Even though the supreme court should decide such legislation to be within the grant of powers to the general government, the distrust and opposition, on constitutional grounds, of so large a portion of the people, could not but go far to defeat the object sought.

The difficulty stated in the foregoing quotation, although now mainly of historic importance, exerted great influence upon the development of the American census prior to 1900. The pioneer work of the census of 1840 in the fields of educational statistics, statistics of occupations, of defective classes and of causes of death, suffered from numerous errors and defects. Public discussion of them contributed to secure radical modifications of scope and method at the census of 1850. Before the census law was passed, a census board, consisting of three members of the president's cabinet, was appointed to draft plans for the inquiry, and the essential features of its report prepared after consultation with a number of leading statisticians and based largely upon the Boston census of 1845, which had introduced many innovations from the Irish census of 1841, were embodied in the law.

The census of 1850 was taken on six schedules; for free inhabitants, slaves, deaths during the preceding year, agriculture,

manufactures and for social statistics. The last asked for returns regarding valuation, taxation, educational and religious statistics, pauperism, crime and the prevailing rates of wages in each municipal division. It was also the first American census to give a line of the schedule to each person, death or establishment enumerated, and thus to make the returns in the individual form indispensable for a detailed classification and compilation. The results of this census were tabulated with care and skill, and a preliminary analysis gave the salient results and in some cases compared them with European figures.

The census of 1860 followed the model of its predecessor with slight changes. When the time for the next census approached it was felt that new legislation was needed, and a committee of the House of Representatives, with James A. Garfield, afterwards president of the United States, at its head, made a careful and thorough study of the situation and reported an excellent bill, which passed the House, but was defeated by untoward influences in the Senate. In consequence the census of 1870 was taken with the outgrown machinery established 20 years earlier, a law characterized by Francis A. Walker, the superintendent of the census, who administered it, as "clumsy, antiquated and barbarous." It suffered also from the fact that large parts of the country had not recovered from the ruin wrought by four years of civil war. In consequence this census marks the lowest ebb of American census work. The accuracy of the results is generally denied by competent experts. The serious errors were of omission, probably confined in the main to the Southern States, and especially frequent among the negroes.

Since 1870 the development of census work in the United States has been steady and rapid. The law, which had been prepared by the House committee for the census of 1870, furnished a basis for greatly improved legislation in 1879, under which the census of 1880 was taken. By this law the census office for the first time was allowed to call into existence and to control an adequate local staff of supervisors and enumerators. The scope of the work was so extended as to make the 22 quarto volumes of the tenth census almost an encyclopædia, not only of the population, but also of the products and resources of the United States. Probably no other census in the world has ever covered so wide a range of subjects, and perhaps none except that of India and the succeeding American census has extended through so many volumes. The topics usually contained in a census suffered from the great addition of other and less pertinent matter, and the reputation of the work was unfavourably affected by the length of time required to prepare and publish the volumes (the last ones not appearing until near the end of the decade), the original underestimate of the cost of the work, which made frequent supplementary appropriations necessary, the resignation of the superintendent, Francis A. Walker, in 1882, and the disability and death of his successor, Charles W. Seaton. The eleventh census was taken under a law almost identical with that of the tenth, and extended through 25 large volumes, presenting a work almost as encyclopædic, but much more distinctively statistical. Its results were received with wide-spread dissatisfaction. In each of the nine decades before 1880 except that including the period of the Civil War the increase of population had been more than 30%. In the decade 1880-90 immigration had been far greater in amount than ever before. And yet the increase of population, if the census was correct, was less than 26%. The popular criticisms aroused by this result were reinforced by the belief that the superintendent of the latest census was less of an impartial executive and more of a party leader than any recent predecessor and the certainty that some of the regions for which the reported population fell most below expectations, notably New York city, were areas likely to send to Congress opponents of the party in power. After protracted discussion of the evidence and especially after subsequent censuses had been taken, it was concluded that apart from certain districts of which New York city was the most important, the census of 1890 was nearly as accurate as others in the series, but perhaps suffered from a slightly larger proportion of omissions. But these omissions, if they existed, were not intentional. New York city includes probably the most densely

inhabited areas in the world and a large floating population. To count that population correctly is perhaps the most difficult field problem before the Census Bureau and in 1890 that particular task was ill done. An important reason, perhaps the main reason, for such defects as were found in the census of 1890 lay in the great number of inquiries conducted simultaneously, resulting in a variety and complexity of schedules which the enumerators were asked to fill.

SCOPE OF CENSUS NARROWED

Competent discussion between 1890 and 1900 fastened on this point, and under the law of 1899 the scope of the census of 1900 was greatly narrowed. This was secured not by abandoning any of the numerous inquiries which had overloaded the two preceding censuses, but by dividing them into major and minor groups, the major group embracing those inquiries, population vital statistics, agriculture and manufactures, for making which enumerators were needed in the field; the minor group embracing those which could be conducted by correspondence supplemented to a slight degree, if necessary, by field agents at strategic points. The law required the completion of the major inquiries in three years (the two preceding censuses had taken more than twice as long to finish) and postponed the minor inquiries until the major group was completed. The new law thus foreshadowed, but did not establish, an office functioning without interruption, and as a natural consequence of it, in 1902 the Bureau of the Census was made permanent. This important and salutary change has been maintained in all subsequent legislation.

In no field of census work has it been more beneficial than in that of vital statistics. Laws dealing with births, marriages and deaths cannot be enacted constitutionally by the Federal Government; only the States or municipalities have jurisdiction over those subjects. As a consequence the registration of such events is a State or local function, and before 1900 it had developed in desultory fashion, leaving the United States as the only large, wealthy and highly civilized country in the world which lacked a national registration system. After the establishment of a permanent census office the situation began to mend. With the help of committees from several national organizations interested in public health, a model law for the registration of deaths was drafted and submitted to the States. At the same time Congress passed a joint resolution commending the draft to their attention. Those States which were already registering deaths adopted or adapted the law, prescribed the model form of death certificate contained in it, and thus laid the basis for uniform records of deaths. State after State among those which had no system of registering deaths fell in line, and as a result, in 1915, a similar plan was applied to the registration of births. In 1927, 42 of the 48 States with 21 cities in the other six States registered their deaths under the model law and practice. These districts, including more than nine-tenths of the country's population, make up the death registration area of the United States, within which the death records are copied from State sources and compiled and published by the Census Bureau in its annual volumes of *Mortality Statistics*. In similar fashion since 1915 the birth records in a "birth registration area" are copied, compiled and published by the Census Bureau in the annual volumes of *Birth, Stillbirth, and Infant Mortality Statistics*, which now relate to more than eight-tenths of the population of the United States. Both systems are extending so rapidly as to justify the hope that within a few years they will have become country-wide. Beginning with 1922 the Bureau of the Census has been publishing annual reports also on marriage and divorce in the United States, so that now it has a promising and steadily improving system of vital statistics under a unique system of voluntary co-operation between the States and the Federal Government. The gradual extension of this system and its present situation appear in the tables.

In addition to its original field of population and its new field of vital statistics, the Federal census has long made periodical reports upon agriculture and manufactures. Between 1840 and 1925 these reports were made only as parts of the decennial censuses, but in 1919 provision was made for quinquennial censuses, those taken between successive decennial censuses being much

Number of Registered Deaths, Births, Marriages and Divorces in the Registration Area of Continental United States to Nearest Thousand for Each Fifth Year Since 1900, and Per Cent of Population Covered by the Returns

| Year | Deaths | Births | Marriages | Divorces | Per cent of population covered by returns | | | |
|--------|--------|--------|-----------|----------|---|--------|-----------|----------|
| | | | | | Deaths | Births | Marriages | Divorces |
| 1900 . | 540 | . | 685 | 56 | 40.5 | .. | 100 | 100 |
| 1905 . | 546 | .. | 805 | 68 | 40.4 | .. | 100 | 100 |
| 1910 . | 805 | .. | .. | .. | 58.3 | .. | .. | .. |
| 1915 . | 909 | 776 | .. | .. | 67.5 | 31.1 | .. | .. |
| 1920 . | 1,143 | 1,509 | .. | .. | 82.2 | 59.8 | .. | .. |
| 1925 . | 1,219 | 1,879 | 1,188 | 175 | 89.4 | 76.0 | 100 | 100 |
| 1926 . | 1,286 | 1,856 | 1,203 | 181 | 89.8 | 76.8 | 100 | 100 |
| 1927 . | 1,237 | 2,138 | 1,204 | 191 | 91.3 | 87.3 | 100 | 100 |

narrower in range than the others. Twenty years earlier a similar change had been made in the field of manufactures, and between 1900 and 1920, reports on that subject were issued quinquennially. But after the later date and beginning with 1921, reports on manufactures appeared biennially. The earlier quinquennial inquiries aimed to cover not merely all manufacturing establishments or factories, but also household or hand industries. The enumeration of the latter was far from complete, and after the census of 1900 the hand industries were excluded.

In comparison with the cost of European censuses the American census is very expensive. The following table gives the cost in thousands of dollars and the per caput cost of each census. The per caput cost for the last five censuses is computed after including the Indian population, that of Alaska, and, from the date of their acquisition, that of the various outlying possessions other than the Philippine Islands and the Virgin islands.

Total and Per Caput Cost of United States Censuses

| Census years | Cost of census in thousands of dollars | Per caput cost in cents |
|----------------|--|-------------------------|
| 1790 | 44 | 1.12 |
| 1800 | 66 | 1.24 |
| 1810 | 178 | 2.46 |
| 1820 | 209 | 2.16 |
| 1830 | 379 | 2.94 |
| 1840 | 833 | 4.88 |
| 1850 | 1,423 | 6.13 |
| 1860 | 1,969 | 6.26 |
| 1870 | 3,421 | 8.77 |
| 1880 | 5,791 | 11.48 |
| 1890 | 11,547 | 18.33 |
| 1900 | 11,855 | 15.53 |
| 1910 | 15,969 | 17.08 |
| 1920 | 25,117 | 23.36 |

(W. F. W.)

CENSUS OF AGRICULTURE: *see* AGRICULTURE, CENSUS OF.

CENSUS OF PRODUCTION: *see* PRODUCTION, CENSUS OF.

CENT. A small copper or bronze coin. In the United States and Canada, it is the one-hundredth part of a dollar, approximately equivalent to a British halfpenny. In Holland the guilder is divided into one hundred cents.

CENTAUREA, in botany, a genus of the family Compositae, containing about 600 species, almost all natives of the Old World, with the principal centre in the Mediterranean region. The plants are herbs with entire or cut, often spiny-toothed, leaves, and ovoid or globose involucre surrounding a number of tubular, oblique or two-lipped florets, the outer of which are usually large and neuter, the inner bisexual. Four species are native in Great Britain. *C. nigra* is the knapweed, common in meadows and pastureland; *C. Cyanus* is the bluebottle or cornflower, a well-known cornfield weed; *C. Calcitrapa* is the star-thistle, a rare plant, found in dry waste places in the south of England, and characterized by the

rose-purple flower-heads enveloped by involucre bracts which end in a long, stiff spine.

In eastern North America, in addition to the British species mentioned, the brown knapweed (*C. Jacea*), the scabious knapweed (*C. Scabiosa*), the Tirol knapweed (*C. Vochinensis*), the spotted knapweed (*C. maculosa*), the yellow star-thistle (*C. solstitialis*) and the rayless centaury (*C. melitensis*) are more or less extensively naturalized. On the Pacific coast *C. melitensis*, there known as Napa thistle, is a troublesome weed, especially in California, as is also *C. solstitialis*; less pernicious are the star-thistle, the blue-bottle and the Turkistan thistle (*C. repens*). The only native North American species, the basket-flower or American star-thistle (*C. americana*) is a robust annual 2 ft. to 6 ft. high, with very showy rose-coloured or purplish flower-heads, 3 in. to 5 in. across. It is found in dry plains from Missouri to Louisiana, and westward to Arizona and Mexico, and is also grown as an ornamental plant.

Numerous species are in cultivation as garden plants; among these the dusty miller (*C. Cineraria*), the bluebottle (*C. Cyanus*) and the sweet sultan (*C. moschata*).

CENTAURS (Gr. κένταυροι), in Greek mythology, a race of beings part horse, part man, dwelling in the mountains of Thessaly and Arcadia. The centaurs are usually said to be the offspring of Ixion and Nephele. They are best known for their fight with the Lapithae, caused by their attempt to carry off Deidameia on the day of her marriage to Peirithous, king of the Lapithae, himself the son of Ixion. In later times they are often represented drawing the car of Dionysus, or bound and ridden by Eros, in allusion to their drunken and amorous habits. Their general character is that of wild, lawless and inhospitable beings, the slaves of their animal passions, with the exception of Pholus and Cheiron.

They are variously explained by a fancied resemblance to the shapes of clouds, or as spirits of the rushing mountain torrents or winds, etc. Perhaps the likeliest suggestion is that they are a distorted recollection of some savage tribe, reputed by its neighbours to be composed of monsters. Like the defeat of the Titans by Zeus, the contests with the Centaurs typified the struggle between civilization and barbarism. In early art they were represented as human beings in front, with the body and hind legs of a horse attached to the back; later, they were men only as far as the waist.

See Roscher's *Lexikon*, s.v. *Kentauren*.

CENTAURUS (the "Centaur"), in astronomy, a southern constellation (invisible in northern lands) rich in bright stars and globular clusters. The two stars α , β are known as the southern Pointers since they point to the Southern Cross. One of these, α Centauri, is the third brightest star in the sky, and it is found to be our nearest neighbour; the distance is $4\frac{1}{2}$ light years (parallax = 0.75"). It is a double star of which the brighter component is almost a replica of the sun, having nearly the same brightness and mass but slightly lower surface temperature; there is also a third widely separated faint companion called Proxima Centauri, because it is slightly nearer to us than the main star. The constellation also contains ω Centauri which is the finest example of a globular star-cluster; it is probably the nearest object of this class, but the distance is no less than 20,000 light years. Photographs of it show more than 6,000 stars within a circle of 20' diameter, but the number must be much greater. (A. S. E.)

CENTAURY (*Erythraea Centaureum*), an annual herb of the family Gentianaceae, with an erect, smooth stem, usually branched above, and a terminal inflorescence with numerous small red or pink regular flowers with a funnel-shaped corolla. The plant occurs in dry pastures and on sandy coasts in Great Britain and has become naturalized in waste grounds in North America from Nova Scotia to Michigan. It presents many varieties, differing in length of stem, degree of branching, width and shape of leaves, and laxity or closeness of the inflorescence. Several other species of the genus are grown as rock-plants.

CENTENARY, the celebration of an event after a hundred years. The word "centennial" (from Lat. *centennius*, from *centum*, and *annus*, a year), though usually an adjective as in "the

Centennial State," the name given to Colorado on its admission to statehood in 1876, is also used as a synonym of centenary.

CENTERING, a term applied to the erection of temporary woodwork to support arches, etc., while they are setting. Thus in the case of an arch, the carpenter forms a "turning-piece" shaped to take the bricks or masonry, and properly tied and braced. This is strutted in position, when the arch is completed by the bricklayer or mason. As soon as the work is set, the centering is carefully removed, which is called "striking the centering." The same method is used in building brick sewers. The origin of the word "centering" is obvious from the primary use in centred arches, but the same term is applied to the use of scaffold-boards to support concrete floors while they are setting hard. (See CARPENTRY.)

CENTERVILLE, a city of southern Iowa, U.S.A., 90m. N.W. of Keokuk; the county seat of Appanoose county. It is served by the Burlington, the Rock Island and the Iowa Southern Utilities railways. The population in 1930 Federal census was 8,147. Large quantities of coal and of pure gypsum are mined in the vicinity, and there are great deposits of shale. The city has railway shops, iron works, a large creamery and a stump-puller factory. The town was platted in 1846, and chartered as a city in 1870. Until 1849 it was called Chaldea.

CENTIGRADE SCALE: see THERMOMETRY.

CENTIME. The one-hundredth part of a franc, the monetary unit of France, Belgium, and Switzerland, is termed a centime. It is from Lat. *centum*, hundred. In Italy the hundredth part of the *lira* is called a *centesimo*; in Spain the hundredth part of the *peseta* is called a *centimo*. (See METRIC SYSTEM.)

FIG. 1.—THE HYPOTHETICAL ANCESTOR OF THE MODERN CENTIPEDE

CENTIPEDE, an animal with a distinct head, one pair of feelers (antennae) and a long segmented body, each typical segment of which is provided with a single pair of walking legs. The Centipedes form in the phylum Arthropoda (q.v.), the distinct class Chilopoda in which well defined subdivisions may be made as follows:—

First Sub-class *Epimorpha*, in which the young leave the egg with the full number of body segments and walking legs.

This sub-class comprises two orders:—

(i.) *Geophilomorpha* (containing ten families) with *Geophilus* as the typical genus, and

(ii.) *Scolopendromorpha* (containing two families), *Scolopendra* being the typical genus.

Second Sub-class *Anamorpha*, in which the young leave the egg with 7 pairs of legs. Afterwards there are periods of growth each of which is followed by a change of skin, resulting in an increase in the number of pairs of limbs until the adult condition is reached. In this sub-class, also, there are two orders:—

(i.) *Lithobiomorpha* (containing three families).

Lithobius is the typical genus, and

(ii.) *Scutigleromorpha* (consisting of one family), with the genus *Scutigera* as type.

In considering the anatomy of the centipedes, we picture a

BY COURTESY OF HUGH MAIN
FIG. 2.—A TYPICAL MEMBER OF THE GEOPHILOMORPHA (*ORSA BARBARICA*), ONE OF THE LUMINOUS CENTIPEDES

hypothetical ancestor without a distinct head but provided in front of the mouth with a single undivided projecting lobe, the prostomium (seen to-day in the earthworm and its allies); the body otherwise consisted of a long series of similar ring-like segments or somites, each provided externally with a single pair of limbs and internally with its own share of the gut, and of the muscular, nervous, excretory, respiratory, blood-vascular and reproductive systems.

In the modern centipedes the head is distinct and may be regarded as a concentration and fusion of a pre-oral lobe (prosto-

BY COURTESY OF HUGH MAIN

FIG. 3.—SCOLOPENDRA MORSITANS A TYPICAL MEMBER OF THE SCOLOPENDROMORPHA

mium), one pre-antennal somite, one antennal somite, one intercalary somite and three somites bearing masticatory appendages (mandibles, first maxillae, second maxillae).

The segment immediately behind the head bears the poison claws or maxillipedes and this is followed by a variable number of segments, each bearing a single pair of limbs.

The head, body and limbs are invested with cuticle which remains flexible wherever movement of the parts is necessary and elsewhere is thickened by a deposition of horny chitin. In a typical limb-bearing segment consisting of a roof, a floor and side walls, the cuticle covering these is reinforced to form definite protecting and supporting plates or sclerites, differently arranged in different forms. Except at the joints the cuticle of the limbs is similarly hardened.

The last three segments of the body (called pre-genital, genital and anal segments) are without walking legs.

Eyes occur in most Lithobiomorpha, all Scutigleromorpha and in all Scolopendromorpha except one family (Cryptopidae). They are absent in Geophilomorpha. A simple eye (ocellus) or a group of separate ocelli is usual but in Scutigleromorpha the external lenses of the group of units fuse into a single faceted lens.

AFTER VERHOEFF, IN BRONN, "KLASSEN UND ORDNUNGEN DES TIER-REICHS" (WINTER)

FIG. 4.—A TYPICAL MEMBER OF THE LITHOBIOMORPHA, THE COMMON CENTIPEDE OF EUROPEAN FIELDS AND GARDENS

On each side of the head in Anamorpha a sense organ (organ of Tömösvary) of unknown function occurs; it consists of a group of cells below the chitin associated with an external hollow near the antenna. The frontal organ of *Lithobius* and *Scolopendra* consists of a group of deep-seated nerve cells behind each eye—its use is unknown.

The digestive tube is simple; it receives, in front, the products of the salivary glands and, further back, those of the excretory (Malpighian) tubules. Its opening is in the anal segment.

The main nerve-cord lies below the gut and ends in front in a nerve mass (the sub-oesophageal ganglion) united with the supra-oesophageal ganglion or "brain," which lies above the front of the gut, by a pair of stout nerve cords.

Breathing is by air tubes or tracheae which open at the sides of the body except in the Scutigleromorpha in which the openings are in the middle line of the back.

The heart, which lies above the gut, is a simple tube and the blood-circulation is in the direction usual in invertebrates—forward dorsally and backwards ventrally.

The reproductive system, which lies above the gut, varies in different centipedes. In the male the number of testes ranges from one to twenty-four. In the adult female the ovary is always unpaired. The reproductive system opens in the genital segment.

From any detailed consideration of anatomy it is clear that the centipede's nearest relatives are insects and that the relationship with millipedes is much more distant.

Owing to the retiring habits of centipedes comparatively little is known about their reproduction. Although the satisfactory observation of copulation has never been recorded, on anatomical grounds it is believed to take place. In the Anamorpha the female after laying each egg carries it about between the specialised claws at the hinder end of her body and eventually, when it has been smeared with a secretion or earth, or both, lays it down where its covering is sufficient protection against enemies.

The eggs of Epimorpha are laid in an open nest and the female guards them faithfully until hatching takes place.

The egg is rich in yolk; this serves as food for the developing centipede which grows from a special area in the lower part of the egg. An examination of the developing animal when the process has been some time in progress may reveal the beginnings of the various head segments and of the walking limbs. When the animal at length leaves the egg its form varies as already indicated, according to the order to which it belongs.

Centipedes as a class have a world-wide distribution.

Fossil centipedes occur in amber of Oligocene age but all older remains tentatively referred to the class Chilopoda are problematical. The least generalised centipedes (the Lithobiomorpha) are the shortest and we are led to conclude that in the evolution of the race the principle of contraction has been at work gradually reducing the number and similarity of the segments of the centipede's body.

Many Geophilomorpha have the power to give light, but as

FIG. 6.—DIGESTIVE TRACT OF A CENTIPEDE (LITHOBIUS FORFICATUS)

these animals are blind the property is perhaps accidental. The light is produced by the simultaneous discharge upon the lower surface of the body of two kinds of glands, which occur in the floor of the body segments. When the two fluids mix outside the body a light is produced.

When the gardener hunting for slugs at night with a lantern sees *Lithobius* carrying off a small slug and shaking it as a terrier shakes a rat he rightly assumes that the centipede is his friend;

but *Lithobius* may kill and eat beneficial insects as well. Geophilomorpha are certainly carnivorous at times, but one species (*Haplophilus subterraneus*) has been known to damage growing celery, lettuce and onions, and other species are likely to be similarly injurious at times.

The painful bite of large centipedes may on occasion cause danger to life. "The part bitten should be bathed in a solution of ammonia—about 1 in 5" (Hirst). Pseudo-parasitism in Man may be due to accidental invasion of the ear or nasal passages and adjacent sinuses by Chilopoda; or to swallowing them either accidentally or in a state of impaired mentality.

Brief mention of centipedes is made by early writers (Aristotle, Pliny, Aelian). Oviedo, the companion of Columbus, describes the occurrence of centipedes in the island of St. Domingo, where he was supervisor of gold smeltings, and mentions the bright light emitted by some of them.

The literature in English is very scattered—most of the best modern accounts are in German.

CENTLIVRE, SUSANNA (c. 1667–1723), English dramatic writer and actress, married at 16 the nephew of Sir Stephen Fox, and on his death within a year she married an officer named Carroll, who was killed in a duel. Left in poverty, she began to support herself by writing for the stage. Some of her early plays are signed S. Carroll. In 1706 she married Joseph Centlivre, chief cook to Queen Anne, who survived her. Her first play was a tragedy, *The Perjured Husband* (1700), and she herself appeared for the first time at Bath in her comedy *Love at a Venture* (1706). Among her most successful comedies are: *The Gamester* (1705); *The Busy Body* (1709); *A Bold Stroke for a Wife* (1718); *The Basset-table* (1706); and *The Wonder! a Woman keeps a Secret* (1714), in which as the jealous husband, Garrick found one of his best parts. Her plots, verging on the farcical, were always ingenious and amusing, and the dialogue fluent. She never seems to have acted in London, but she was a friend of Rowe, Farquhar and Steele. Mrs. Centlivre died on Dec. 1, 1723. Her dramatic works were published, with a biography, in 1761 (reprinted 1872).

CENTO, a town of Emilia, Italy, province of Ferrara, 18m. S.E. direct from the town of Ferrara, 50ft. above sea-level; it is reached by road (6m. to the west) from the station of S. Pietro in Casale, 15m. S.W. by W. of Ferrara, and also by a steam tramway (18m. N.) from Bologna to Pieve di Cento, on the opposite bank of the Reno. Pop. (1921) 4,942 (town); 21,084 (commune). It is connected by a navigable canal with Ferrara. It was the birthplace of the painter Giovanni Francesco Barbieri (Guercino), and there are several of his works in the town.

CENTO, a composition made up by collecting passages from various works. The Byzantine Greeks manufactured several out of the poems of Homer, among which may be mentioned the life of Christ by the famous empress Eudoxia, and a version of the biblical history of Eden and the Fall. The Romans of the later empire and the monks of the middle ages were fond of constructing poems out of the verse of Virgil. Such were the *Cento Nuptialis* of Ausonius, the sketch of biblical history which was compiled in the 4th century by Proba Falconia, wife of a Roman proconsul, and the hymns in honour of St. Quirinus taken from Virgil and Horace by Metellus, a monk of Tegernsee, in the latter half of the 12th century. Specimens may be found in the work of Aldus Manutius (Venice, 1504; Frankfurt, 1541, 1544). In 1535 Laelius Capitulus produced from Virgil an attack upon the dissolute lives of the monks; in 1536 there appeared at Venice a *Petrarca Spirituale*; and in 1634 Alexander Ross (a Scotsman, and one of the chaplains of Charles I.) published a *Virgilius Evangelizans, seu Historia Domini nostri Jesu Christi Virgilianis verbis et versibus descripta*.

CENTRAL AMERICA, geographically that portion of the American continent lying between the Isthmus of Tehuantepec in Mexico, and the Isthmus of Panama, or Darien, in the republic of Panama; politically, the five republics of Costa Rica, Nicaragua, Honduras, Salvador and Guatemala, and the British crown colony of Belize, or British Honduras. The geographical division is commonly known as "the isthmus," lying as it does between the narrowest portion of Mexico (Tehuantepec), immediately north of which Mexico broadens to continental proportions, and Panama, the narrow neck of land now cut by the canal, immediately south of which Panama and then Colombia broaden into the South American continent. The political delimitation of Central America, that is, the giving of the name to the five republics and British Honduras, is based, like most of the present boundaries of Spanish America, on the old Spanish colonial administrative areas. Central America is now, roughly, what was comprised in the captain generalcy of Guatemala, on the north of which was the viceroyalty of Mexico, or New Spain, and on the south the viceroyalty of Nueva Granada, out of which have since been carved Panama, Colombia, Venezuela and Ecuador. The inclusion of Panama in Central America, while now common, is the result of a loose lumping of the smaller Caribbean republics of the isthmus into one group in our common thinking, but Panama was never politically associated with the Central American countries and until 1903, indeed, had no political life separate from Colombia. Geologically and climatically, however, Panama might properly be included in Central America, owing to the fact that the geographical division which is called "the isthmus" is thus, also, the natural geological and climatic unit.

Central America, as politically delimited, lies between 8° and 18° 3' north latitude and between 82° 50' and 92° 17' longitude west. The easternmost point of Central America is thus almost directly south of Florida, in the United States, and the most westernly point is almost directly south of Galveston, Texas. The northern boundary is Mexico for a portion of the distance (north of Guatemala and British Honduras), and the Caribbean sea for the long northern boundary of Honduras. On the east is the Caribbean and on the south and west the Pacific ocean. British Honduras stands vertical, north and south, along the eastern edge of the almost uninhabited wilderness of Peten, in Northern Guatemala, once the seat of the great "old" Maya empire, and the British colony faces on the Caribbean. The five republics, on the other hand, trail off from north-west to south-east, some 600m. long and 250m. wide at their widest point (between the north-eastern corner of Honduras and the south-western coast of Nicaragua). The longest straight north and south line in the entire isthmus is between the northern coast of Honduras and the peninsula of Nicoya in Costa Rica, about 450m. The total area is approximately 185,000 square miles.

Physical Features.—The main *cordillera* of the American hemisphere traverses Central America, leaving the countries divided into the high plateaux in the centre and the lowland coastal country on either side. Tehuantepec (far to the north), Nicaragua

and Panama (to the south of Central America proper) each present, however, the anomaly of low passes through which a transcontinental railway, a river and an interoceanic canal cross, respectively, between the Atlantic and the Pacific. The mountains are elsewhere continuous, and the high plateaux in each country are marked with hundreds of small, fertile valleys, enjoying salubrious climates and great fertility. Part of the fertility is due

THE CHURCH OF LA MERCED AT ANTIGUA, GUATEMALA, THE CHIEF CHURCH OF THE OLD CAPITAL AND ONE OF THE FEW THAT RESISTED THE EARTHQUAKE OF 1773

to the volcanic ashes which form the subsoil and often the soil itself, in these areas. The high peaks of Central America, rising, some of them, far above the granite and conglomerate rocks of the mountains, are volcanic cones, some reaching a height of 13,000ft. above sea-level (the mountains are described in the articles on each of the countries). Volcanoes smoking or silent, mark the landscape in every country, sometimes as many as a dozen volcanoes being visible from one spot, while eruptions in relatively recent years have in some cases caused the rebuilding of railways around or across the blackened lava beds.

Central America boasts the largest lake south of the great lakes of Canada and the United States, and north of Lake Titicaca in Peru and Bolivia. This is Lake Nicaragua, 110m. long by 45m. wide, while Lake Managua, 38m. long by 16m. wide, is connected with it by a short river. Salvador has a number of beautiful lakes as has Guatemala, Lake Atitlan being one of the most beautiful spots in the Central American mountains. The rivers on the Pacific side are most of them short and swift, as the coast is narrow, the Lempa, in Guatemala, Honduras and Salvador being the most important. On the Caribbean side the rivers are longer and more important, the Segovia or Wanq being some 450m. long. The Caribbean coast is marked by lagoons and great bays, which are virtually landlocked salt water lakes. (W. THO.)

Geology.—The trend of the structural lines in South America is not continued in Central America, where the strata are bent into folds whose axes extend nearly east and west. The mountain ranges in Central America are therefore assigned to what is called the Antillean system, as distinguished from the Andean system. Two submarine ridges that extend across the Caribbean sea, one between Honduras and the Sierra Maestra range in Cuba and the other between Cape Gracias a Dios and Jamaica, are regarded as submarine Antillean ranges. An exception to the general eastern direction of the folding is seen in the depression that crosses Honduras from the Gulf of Fonseca to Puerto Cortes, where the trend of the folding is generally northward. This depression may be a trough formed by faulting.

In Guatemala there is a group of eastward-trending ridges composed of old granite and schist, and areas of similar rocks, presumably Archaean or Palaeozoic, are found in British Honduras, Honduras and Costa Rica. In Guatemala these old crystalline rocks are at some places overlain by beds of Carboniferous limestone. The oldest Mesozoic rocks are some isolated beds of sand and clay, possibly of Triassic age, containing the remains of

plants. Large areas of Cretaceous clay, sandstone and conglomerate and an overlying series of beds of limestone are found in Guatemala, Honduras and Costa Rica. The Tertiary rocks, which are widespread, may be divided into two parts. The lower part consists of Eocene and Oligocene beds, chiefly sand and clay, which were evidently laid down in shallow water, near the shore. The upper part includes Pliocene beds, which were also laid down mainly in shallow water.

All the beds up to those of the Oligocene series are involved in the structural folds. The Pliocene beds are generally undisturbed. The Miocene epoch appears to have been a time of uplift and great disturbance throughout the Caribbean region. The two continents were probably brought together by the Isthmus of Panama during that epoch. The record disclosed by a study of the fossils of North and South America confirms this conclusion. It shows that the mammals of South America in middle Tertiary (Oligocene) times included none of those that then inhabited North America. The South American mammals of this time included armadillos, sloths, ant bears and a number of peculiar rodents, among them the water hog, the largest rodent known, none of which are represented by middle Tertiary fossils found in North America. The middle Tertiary North American mammals, on the other hand, included several species of deer, wild hogs, wolves, rabbits, squirrels and other well-known animals. The deposits of late Tertiary (Pliocene) times of both continents, however, show a mingling of animals belonging to both groups, confirming the conclusion indicated by the geologic record—that the two continents were joined late in Miocene times by an uplift of the land that made possible the migration of animals from one to the other. Further confirmation of this conclusion is found in the results of the studies of the sea fishes on both sides of the Isthmus of Panama, which show differences indicating a separation of the fishes in Miocene times.

The volcanoes in Central America stand along the west coast. The volcanic deposits are extensive and deep. The eruptions began near the end of the Cretaceous period and still continue intermittently. The eruptive lavas and ashes are mostly andesite and basalt but include also rhyolite and trachyte, and, at a few places, some phonolite. (G. McL. Wo.)

Population.—The total population of Central America (excepting British Honduras) as estimated by official bureaux of the government of the countries, is 5,965,913. Its composition is varied, from virtually pure-blooded Spanish whites on the highlands of Costa Rica to a mixture of Indian and negro which calls itself "Carib Indian" on the Caribbean coast of Nicaragua, Honduras and Guatemala (*see* *Ethnology*, p. 128).

HISTORY

Central America was discovered by Christopher Columbus himself on that last fateful voyage when he drove desperately westward from the Caribbean islands in a determination to find the strait to the China seas which he believed existed just beyond the barrier of the great continent that he had revealed to the world. He skirted the coast of Central America for virtually its full length, exploring the inlets and the immense lagoons, to the greatest of which his own crew gave a name in his honour—the Laguna del Almirante ("the Lagoon of the Admiral"). On this voyage, in 1502, Columbus founded in Costa Rica, the first colony in Central America, leaving his brother Bartholemew, in command, but the Indians, whose gold ornaments had been accepted by the Spaniards as assurance that gold was abundant there, quickly dispersed the colony and its survivors rejoined Columbus. No rich source of the gold of these ornaments—rare archaeological treasures to-day—has ever been found in Costa Rica, and the absence of treasure in Central America was doubtless largely responsible for the fact that Central America was not the subject of spoliation. Its location close to what was to become the chief route of shipment to Spain of the treasures of Peru and of the Orient, made its control and its wise political administration important in the eyes of Madrid.

Guatemala was conquered by Pedro de Alvarado, as lieutenant and representative of Hernando Cortez, who himself led his army

for part of the way from Mexico through the jungle wilderness in 1522 and 1523. Alvarado was opposed by the highland Indian and a terrible battle was fought not far from Quezaltenango between the Spaniards and the Indians under Tecum, resulting in defeat of the Indians which was apparently decisive. Costa Rica was conquered in 1513 by Pedro Arias de Avila, but the entire region from Mexico to Panama was made a portion of the vice-royalty of New Spain or Mexico, and after its organization as a captaincy general Costa Rica was included in the administrative unit. The conquest of the other Central American provinces was largely perfunctory, little opposition being encountered excepting on the Caribbean coast, where the Carib Indians were virtually exterminated.

The captaincy general of Guatemala, including all of present day Central America and a portion of Mexico, declared its independence of Spain, with little bloodshed, on Sept. 15, 1821, and almost immediately thereafter came under the domination of the Emperor Iturbide of Mexico, and was part of his empire. The overthrow of the Mexican empire, however, returned the autonomy of Central America to its own people, the Mexicans retaining the former Guatemala territory now incorporated in the recognized national boundaries, long regarded as a Guatemalan "irredenta."

Central American Union.—On July 1, 1823, the first Central American union was formed, comprising the five old Spanish provinces, now Guatemala, Honduras, El Salvador, Nicaragua and Costa Rica, the only boundaries between the provinces and between Central America and the outside, being those of the old Spanish administration; Belize had been occupied by British traders engaged in the hardwood lumber trade since the 17th century, and the eastern coast of Nicaragua was practically a British protectorate, under the name of "the Mosquito kingdom." By the Clayton-Bulwer treaty of 1850 between the United States and Great Britain, Belize was recognized as a British possession and became British Honduras, while the protectorate of the Mosquito coast was surrendered by Great Britain and the territory reverted to Nicaragua. The boundary between Costa Rica and Colombia was then, and continued until 1921 (when the controversy was, of course, between Costa Rica and Panama) to be in question, the settlement by Chief Justice White of the U.S. Supreme Court, confirming the earlier decision of the king of Spain, being accepted that year. The Mexican boundary and that of British Honduras, while somewhat vague in actual location, owing to the undeveloped condition of the country, were firmly established along parallels of latitude or degrees of longitude.

The first Central American union, as formed in 1823, was dominated by the conservative elements of Guatemala, including the clergy and Spanish administrators, and this domination proved irksome to the elements which, distant from Guatemala, had a more liberal idea of the independence and its potential possibilities for themselves. The first opposition to this union broke out in Honduras, where the Federalist or Liberal party had grown powerful and had evolved strong leaders. Since that date, the political parties of all the Central American countries have sprung from these two parent stems, and continue the use of the names Conservative and Liberal. Thus, even to-day, it may be safely said that the Conservatives of any one of the countries are closer to the Conservatives of the other countries than they are to the Liberals of their own country, the same being true of the Liberals. The complicated politics of Central America, with its wars and revolutions, are understandable only if that fact is remembered and counted upon.

The bitter struggle which began in the '20s continued finally under the leadership of the great Guatemalan Conservative Rafael Cabrera, and the equally able and more spectacular Liberal leader of Honduras, Francisco Morazan. Morazan was finally defeated and executed in 1842, and the federal union, which he had made his battle-cry, was dissolved. A union dominated from Guatemala was formed in the same year but without Costa Rica. This dissolved in 1825, and in 1850 Honduras, Salvador and Nicaragua formed another union which was broken up by the Guatemalans under Cabrera, as being a threat against the autonomy of that country and the power of the Conservative party.

The battle for the union was the occasion of the landing in Nicaragua in 1856 of the American filibusterer, William Walker (*q.v.*), who joined forces with the Liberals in the struggle for the control of Nicaragua and was for a time the Liberal president of that Republic, and was attacked by the Conservative forces of all the countries of Central America, ultimately suffering defeat and death at their hands.

The efforts to form the Central American union lapsed after about 1860, until 1876, when Justo Rufino Bárrios, the great Liberal leader of Guatemala, endeavoured to revive the old federal union, under various plans. He was killed in battle in 1885, in the course of an invasion of Salvador, then ruled by the Conservatives, in a final effort to impose the union by force. Futile efforts at union were made in 1887, 1892, 1895, 1897 and 1898.

In 1902, a move of considerable significance in Central American history took place at Corinto, Nicaragua, when representatives of Costa Rica, Nicaragua, Honduras and Salvador drew up a treaty creating a tribunal of Central American arbitrators for the pacific settlement of international disputes. Four years later, a dispute between Guatemala and Salvador reached a point where war was avoided only by the intervention of President Roosevelt of the United States and President Diaz of Mexico. This was followed by a conference on the high seas aboard the U.S. cruiser "Marblehead," one of the shortest and most effective peace conferences on record and known in Central America as the "Peace of the *mal de mer*." As a result there was drawn up in San Jose, Costa Rica, on Sept. 15, 1906, a new treaty between Costa Rica, Honduras, Salvador and Guatemala, under the provisions of which the presidents of the United States and Mexico were agreed upon as umpires in any future international disputes between the signatory nations.

Nicaragua was not a party to the San Jose pact, and its president, Jose Santos Zelaya, declined to join in it. Therefore, in 1907, when Zelaya became involved in a controversy with Honduras over revolutionary activities in the ill-defined borderland between the two countries, Nicaragua offered to arbitrate under the Corinto plan before a commission of Central Americans, while Honduras was willing to arbitrate only under the San Jose plan, before the presidents of the United States and Mexico. No arbitration was taken, therefore, and the situation grew more serious, involving Salvador and threatening to involve Guatemala. The ultimate result was the mediation of the United States and the calling of the first Central American conference at Washington, which met on Nov. 13, 1907, representatives of all five of the republics being present.

The conference resulted in the signing of a general treaty of peace and amity, including a provision that recognition should be withheld from revolutionary governments until the country suffering the revolution had been reorganized by constitutional means. It also resulted in the creation of the Central American court of justice, to be located at Cartago, Costa Rica, and to be formed of judges named by the five countries, sitting virtually continuously or subject to immediate call to settle all questions which diplomacy should fail to resolve, and to determine cases involving alleged denials of justice to private citizens of one country by the courts of another.

Central American Court.—The court was established on May 25, 1908, at Cartago, and was later removed to San Jose, where a handsome building, the gift of Andrew Carnegie, was erected for it. The court functioned smoothly until Costa Rica and Salvador brought before it their claims for alleged damages from the signing by Nicaragua of the Bryan-Chamorro treaty of 1916, by which Nicaragua ceded to the United States in perpetuity the right to build an interoceanic canal following the channel of the San Juan river and gave the United States the right to erect naval bases on the Corn islands on the Caribbean coast and on Fonseca bay on the Pacific. Costa Rica held that its title to the southern shore of the chief mouth of the San Juan river had not been recognized in the negotiations and Salvador that an American naval base on Fonseca bay constituted a direct threat against its peace and sovereignty, as Salvador, equally with Honduras and Nicaragua, fronted upon and was exposed to the Bay

of Fonseca which the proposed base would command.

In the controversy before the Central American court Nicaragua held that its treaties and relations with other powers were not subject to the scrutiny of the court, and when defeated in this stand, by a vote of four to one, withdrew from the court, and shortly thereafter the court ceased its functions.

The 1923 Conference.—In 1920, new agitation for the formation of a Central American union arose, the interest centring in Guatemala, where this time the unionist movement was largely Conservative. The movement resulted, in Guatemala, in the overthrow of the government of Manuel Estrada Cabrera, who had been president of Guatemala for 18 years. A pact of union was drawn up, in Dec. 1920, with Guatemala, Salvador and Honduras signing, Costa Rica favourable and Nicaragua noncommittal. Honduras was prepared to give up its capital city, Tegucigalpa, to be made the capital of the union, and to remove its own capital to its former site, Comayagua. The overthrow of President Herrera of Guatemala by a Liberal counter-revolution led by Jose Maria Orellana came on Dec. 6, 1920, and following its success, Guatemala withdrew from the union and the plan collapsed. The collapse of the 1920 effort for the union left Central America in a state of political uncertainty. Costa Rica in the meantime had had her unpleasant experience with the Tinoco revolution and non-recognition abroad, and the counter-revolution had restored the old succession; Salvador had passed through a period of political uncertainty saved, finally, by the election of President Alfonso Quiñonez, a strong ruler; Guatemala, under President Orellana, was settling down to prosperity and peace, but Honduras was uncertain, and the revolution which broke out in 1924 was in the air, with danger to all established governments in Central America.

At this juncture, a second Washington conference of the Central American States was called, which met on Dec. 4, 1922, and adjourned on Feb. 7, 1923. The American secretary of State, Charles E. Hughes, presided personally at all the sessions, and the 14 treaties and conventions then drawn up were signed by all the countries, and one of them (providing for commissions of inquiry as a basis for arbitration) by the United States as well. The 1923 conventions and treaties were regarded in Washington as destined to clear the troubled political waters of Central America, but none of the five countries ratified all of the treaties, and those still unratified include that providing for commissions of inquiry, the only one to which the United States is a signatory. The general treaty of peace and amity, signed by all the countries, went further than that of 1907 and provided that the nations would not recognize rulers in the other nations who had come into power by a revolution or *coup d'état*, nor the succeeding governments, even if installed as a result of an election, if the head of the State was a leader, or a close relative of a leader of the revolution or *coup d'état*. The department of State of the United States, in connection with its efforts to forestall the Honduran revolution of 1924, issued a note to the contending parties in Honduras (and caused it to be sent to the foreign offices of the other Central American countries) to the effect that while not a signatory to this treaty, it would follow this test of legitimacy in according its own recognition to new governments in Central America.

The political developments in Nicaragua following the withdrawal of the American marines in 1925 (*see NICARAGUA*) were based in part on the literal support of Washington of this policy, and this in turn has brought forward the criticism that with Washington's effort to eliminate the right of revolution as the escape-valve of oppressed peoples, there should go a corresponding provision, by Washington, of the assurance of fair elections at which the majority might express itself, and that Washington should support the legitimate succession when imperilled. The former dictum was accepted by Henry L. Stimson, the investigator sent by President Coolidge in 1927, and an election guarded by U.S. marines was assured for 1928, but the policy of supporting legitimate governments was declared an impossible development of the situation enunciated in the case of Washington's refusal of aid to Vice President Juan B. Sacasa when he was driven out of Nicaragua by the Chamorro revolution in 1925.

Communications.—The geographical situation in Central America is such that peace between the countries, freedom from domestic disturbance within and, probably, the possibility of a federation of the five countries in a union at some future date, is more dependent on communications than on politics. It is probable that peace will be assured with an adequate system of roads within the countries and that international wars will end with the building of railways between countries.

Two of the countries, Guatemala and Costa Rica, have transcontinental railway systems. Practically all the commercial railways in Central America are 36 in. gauge. One country, Honduras, has only one general commercial line, the others being owned and operated by banana companies on the Caribbean coast. Nicaragua has only one railway, paralleling the Pacific coast, from the port of Cortino to Leon, Managua and Granada. Salvador and Guatemala have comparatively adequate railway systems, all—excepting the British-owned line from San Salvador to Acajutla in Salvador—owned by the International Railways of Central America, a United States enterprise.

The highway development of Central America, while not so rapid, even proportionately, as in South American countries generally, is advancing steadily. Salvador is the most advanced, a nation-wide system having been planned in 1926 and being now steadily under way. Guatemala is second, with a fairly general highway plan, partially executed. Honduras has depended more on highways than have the other countries, and has a magnificent and extremely expensive road from the Pacific port of Amapala (San Lorenzo on the mainland is the terminus of the highway) to Tegucigalpa, and the through road to the Caribbean coast, by highway and lake boat, to the head of the National railway at Portrerillos is now open most of the year making automobile traffic comfortable.

Nicaragua has suffered more than any of the other countries from lack of adequate communications, and excepting for the highway from Managua to Matagalpa, open during the dry season and usually passable in the wet season, has been almost undeveloped. On the Atlantic and Pacific sides, the lack of rock for road construction has been a serious obstacle, and in the mountains the absence of settlements has made the construction of roads expensive in proportion to their benefit. The railway to the Atlantic coast has long been an unattainable ideal, and adequate highway development a serious government problem. Costa Rica, with its transcontinental railway system, has been virtually without feeder railways or roads, and concentration of the life of the country on the plateau has been a necessary result. It has planned an adequate highway system, but so far development has been slow.

Economic Development.—Economically, Central America is still in an era of paternalistic plantation production, having few factories, a small variety of agricultural products, and importing a great variety of goods in exchange for its staple products: coffee, sugar, hides and bananas. Costa Rica produces little excepting coffee and bananas and a small quantity of gold, importing cattle, wheat, rice and beans from Nicaragua and Salvador. Nicaragua is a producer of coffee and sugar, while cattle and foodstuffs are also listed in its export products. Honduras is a cattle and banana country, but produces much of the food and coffee consumed and considerable tobacco and sugar. Salvador is a producer of coffee, although it also produces and exports foodstuffs and certain specialties like balsam and indigo. Guatemala is a producer of coffee, sugar and bananas; cattle are fattened on its ranges and slaughtered for the market in Mexico. The countries are as a whole, however, producers of but two crops; coffee and bananas. Coffee is grown under plantation conditions with many disadvantages to the working population. The coffee of Central America is of an exceptional quality, that of Costa Rica being virtually all sold in London for special blends, and that of Guatemala finding its best market in Germany. The banana industry, while highly productive, is a foreign-owned enterprise, highly organized and not closely identified with the countries.

The opportunities for the development of Central America have always seemed tempting, and British and German capital has

found a ready investment as has, in more recent years, American capital, in increasing amounts. The lack of abundant labour supplies has been a deterrent to Central America's economic development, but the proximity of the producing regions to the long coastline and the possibilities of machine development of the agricultural resources have been tempting. Little mining has been done on a large scale, owing to the character of the country, which has few mineralized sections, and these not of great richness. The chief importance of Central America as an economic unit seems to be derived from its proximity to the Panama canal, and from the possibility of the building of another canal through Nicaragua, placing the countries close to the interest and possible economic development of the United States.

ETHNOLOGY

The aboriginal inhabitants of Central America differ in speech, in physical type, and in manner of life. Before the Spanish colonization these contrasts were much more marked, and from the study of linguistic and archaeological evidence it is clear that the district comprising southern Mexico and Central America never was an isolated and self-contained ethnic unit. On the contrary, to this focus of highly developed civilizations barbarian tribes had pressed from both the north and the south. Hence to explain the present it is necessary to examine the past.

The most ancient people as yet revealed by the spade in Middle America have lost their very name in the mists of the past, and their culture is known to-day simply as the "archaic." It has been traced under lava flows and huge beds of volcanic ash from the Valley of Mexico to Salvador. These people were not primitive, for they understood the arts of weaving and pottery making.

NATIVES OF GUATEMALA AT A MARKET

Their cultural status may be compared to that of the present Pueblo Indians. How long ago they flourished cannot be said. There is also reason to believe that at least one other stream of culture existed contemporaneously in Middle America.

Before the beginning of the Christian era there began an influx of population from South America, represented by archaeological remains and by many tribes speaking dialects of the Chibchan tongue of Colombia and Ecuador. In the 16th century they occupied practically all of Panama and Costa Rica, eastern Nicaragua, and possibly eastern Honduras. These various historic groups probably do not represent the spearhead of the thrust northward

3. Street scene in a Honduras village, characteristic of all Central American countries
4. Guatemala. Agua, the volcano which overhangs Antigua, the old capital. Eruptions have destroyed the city thrice in four centuries
5. Managua, Nicaragua. A better-class patio, showing kitchen and laundry
6. Guatemala. Market place in Quezaltenango
7. Outskirts of Port Barrios, Guatemala. Note the flimsy construction of the houses

The first comers either may have been the Maya and Chorotega (*see below*), or else some of the small isolated tribes living in areas of refuge, such as the Xinca.

By the beginning of the Christian era two large linguistic groups, Maya and Chorotega, had assumed a definitely historic pattern. Owing to their use of writing and the calendar, definite dates can be applied to their archaeological remains thenceforward. The Chorotega then lived in western Honduras and possibly parts of Guatemala. From this region they were displaced by the Maya, who forced them to move to the north and south. At the time of the Spanish conquest they had settled in southern Mexico and also on the south coasts of Costa Rica, Nicaragua and Honduras. The first great Maya cities arose on the plains of northern Guatemala, to-day an almost uninhabited jungle. Here they erected a host of well-built edifices of stone and concrete. About the beginning of the 6th century A.D. construction ceased, and it has generally been assumed that the Maya immediately abandoned these cities. Recent archaeological studies, however, indicate that they continued to occupy some at least of the older towns. At any rate, it is known, from ancient writings, that the Maya had discovered and partly colonized Yucatan as early as the 4th century. They now proceeded to populate it and also the highlands of southern Mexico and Guatemala. By the 11th century both in Yucatan and Guatemala the Maya had established a series of powerful principalities and again were housed in well-built cities of stone. In Yucatan there arose a league of three princely houses, the Itza, Xiu, and Cocom, who dominated the peninsula in unity for 200 years. In A.D. 1201, a civil war broke out, the Itza capital was sacked with the aid of Toltec mercenaries, and the Itza were forced to withdraw to the jungles of Guatemala, where they maintained their ancient civilization against all attacks until the end of the 17th century. In Yucatan the Cocom family became the overlords of the peninsula, but they were overthrown in turn by a coalition of petty princes organized by the Xiu in 1458. When the Spaniards reached Yucatan it was badly disorganized politically as it had been ravaged for over 300 years by intermittent warfare.

In Guatemala by the 12th century there had also arisen a series of well-organized kingdoms and principalities, of which those of the Quiché (*q.v.*), Cakchiquel, and Zutuhil were the most noteworthy. Here again was enacted a series of bitter wars which terminated only with the Spanish conquest.

According to their traditions the Toltec settled in central Mexico in A.D. 752, and there developed a kingdom which lasted until 1070. By all accounts, it is clear that the Toltec and Maya princes of both Yucatan and Guatemala were friendly, and that intermarriages took place occasionally. Indeed it has been suggested that the Toltec were a Maya tribe who wandered to Mexico and there borrowed the Nahuatl tongue of their neighbours. Upon the downfall of their empire part of the Toltec went to Yucatan as mercenaries. Others pushed southward and settled in Guatemala, Honduras, Salvador and Nicaragua, where they were encountered by the Spaniards.

The Aztec, the last comers in the Valley of Mexico, founded their capital in 1325 and rapidly rose in military power. Like the Toltec they spoke Nahuatl, a tongue related to Indian languages of the United States, such as the Ute. Although they overran Central America with semi-military trading expeditions, they made no permanent settlements except two small colonies in Salvador and Panama. Two other tribes, the Subtiaba of Nicaragua and the Tlapanec of Guerrero, both small and obscure peoples, show linguistic connection with the United States. Their tongues have recently been connected with the Coahuiltecan languages of northern Mexico and Texas as well as with the Hokan of California. Other small tribes exist in Central America but their linguistic relationship remains doubtful. These include the Xicaque, Lenca and Paya of Honduras and the Xinca of Guatemala. It has been suggested that they are related to each other and to the Mixe-Zoque tongues of southern Mexico.

Finally, on the north coast of Honduras and adjacent portions of British Honduras there live Carib Indians. They came originally from St. Vincent where they caused the English much

trouble. In 1796 they were deported at a cost of nearly \$5,000,000. Many of them show a strong infusion of negro blood.

The conditions under which individual Indian tribes live to-day in Central America depends on their inherited culture, their environment, and their culture-contacts with Europeans. In Guatemala throughout the highlands the Indian has been forced to support the European population through a system of peonage little better than slavery. However, he has maintained his racial purity, his language, his distinctive and beautiful costumes, and beneath a veneer of Christianity, much of his ancient religion. In this region, the European domination has meant for the Indian the introduction of new food plants such as coffee, the substitution of taskmasters of his own race by foreigners, and the suppression of certain liberties such as intertribal warfare and religious ritual. Their lot is not enviable, but probably they are as well off materially, excepting the ancient nobility, as before the Conquest. In Honduras, Salvador (except the west) and Nicaragua, most of the Indian population has fused with European blood to form the *ladino* class, which makes up the bulk of the population. Aspiring to a European scale of living, these people often retain many traits of their Indian ancestors, and through poverty are forced to exist in the same manner as the Indians themselves. There is little social discrimination against the *ladino*, so, as he usually

owns little or no property, he often resorts to violent political action as a short cut to wealth. Indeed it is said that the present political divisions in Nicaragua are based on the pre-Columbian hostility of the Mangue and Nicaraao tribes.

Along the Atlantic coast of Central America from central Honduras to the south-east there exist scattered Indian tribes who maintain a semi-independence. They live chiefly by hunting and

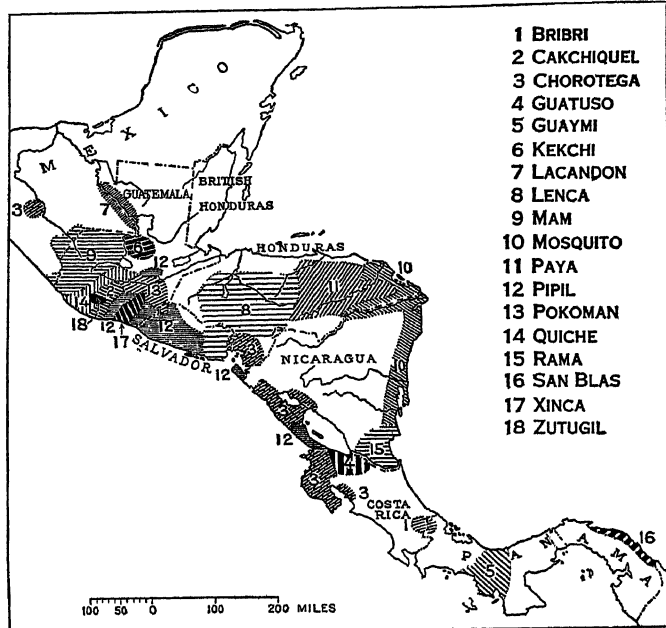

CHART SHOWING THE DISTRIBUTION OF THE CHIEF INDIAN TRIBES OF CENTRAL AMERICA

fishing. All of them are agriculturalists, but in general their food-plants point towards South America rather than North America. European diseases, alcohol, and a jungle environment are leading them towards extinction. The San Blas, who have excluded Europeans from their territory, are the largest and most vigorous of these hunting tribes.

All of the Central American Indians have come under the influence of Christianity. Even some of the wilder tribes call themselves Christians. In general the Indian has not been hostile to the new religion, but has seen no reason for abandoning his own. The result has been a curious blend, finding expression in exotic cults such as the famous Black Christ of Esquipulas. In Central America, as long ago in Europe, the church has had to extend its mantle over paganism which it could not extirpate.

ARCHAEOLOGY

The archaeology of Mexico and Central America cannot be discussed in terms of modern geography. The southern half of Mexico, with Guatemala, British Honduras, the north of the republic of Honduras (at least) and Salvador, constitute an archaeological complex which can only be examined as a whole. Further south, the ancient culture of Nicaragua is still very obscure, although it was evidently subjected to influences from the north. These influences extended into certain regions of Costa Rica, and even of Panama, although, in the two last-named Republics, they were clearly of late introduction, and the indigenous culture displays increasing affinities with that of the Southern

Continent. The region as a whole is characterised by great linguistic diversity, but certain main groups may be distinguished which appear to coincide fairly accurately with the archaeological areas. Details may be obtained from the linguistic surveys published by Thomas, Swanton and Lehmann.

The Antilles, ethnologically and culturally belong to South America, and their archaeology is treated in connection with that of the Southern Continent.

The Ancient Maya.—The earliest manifestation of a superior form of culture in the area is associated with the Maya. The term is linguistic, and includes a large number of tribes speaking different dialects spread over a wide area. The culture, in its earliest known phases, attained a high level and is characterised by great proficiency in architecture, stone-carving, pottery and the textile arts, in spite of a complete ignorance of iron, of the principle of the wheel (either for pottery or traction), and of the true arch. A special feature of this semi-civilization was an elaborate "hieroglyphic" script, and a very complicated calendar. The greater part of the recorded inscriptions consist of elaborate calendrical computations, which can now be read, and many of the monuments can be placed in their chronological sequence. The correlation of Maya dating with European chronology, however, is still somewhat obscure, though the most likely theories differ by less than three centuries (see *CHRONOLOGY* and *CALENDAR*).

Early History.—The earliest phase of Maya culture, to judge from recorded dates, occupied a very definite area, roughly in the shape of an inverted triangle, the base of which extends almost horizontally from the ruined site of Palenque, in the Mexican state of Chiapas, to the Atlantic, with its apex resting on the site of Copan, in the Republic of Honduras. The earliest dates so far recorded have been found at Tikal and Uaxactun towards the north-eastern corner of the area. The continuity of dates at various settlements indicates that the region was in continuous occupation for over four centuries. This period is known as the Early Maya Empire. Towards the close of the period, there is evidence of an extension northwards, resulting in an abrupt desertion of the ancient sites, and a transference of the population to Yucatan. The latest dates at the important Old Empire sites are

MAYAN MONUMENT DISCOVERED IN THE JUNGLE OF QUIRIGUÁ, GUATEMALA

covered by a very short span of years. The cause, or combination of causes, which led to this migration, are still obscure.

The Maya occupation of Yucatan is generally known as the "New Empire," and is distinguished by a modification of the dating system, and certain architectural and artistic peculiarities, best expressed in the important settlements of Chichén Itzá and Uxmal. A further development occurred later, owing to Toltec influences emanating from the Valley of Mexico (see below). For this period there exist certain semi-historical documents, the chronicles of the Tutul-Xiu tribe (known as the *Books of Chillon Balam*), which were reduced to writing in post-conquest times and the invaluable account of Bishop Landa (1566) (see *Bibli*

ography). Though the main body of the early Maya migrated north, it is clear that a branch travelled west, because monuments, bearing dates later than any of those within the early Maya area, have been discovered at Sacchana in the direction of Oaxaca. In fact the Maya calendar, and much of Maya culture, appears to have been adopted by the Zapotec tribes of Oaxaca, and to have spread thence to the Valley of Mexico, though in attenuated form. Here it was developed by the Toltec, the first wave of a stream of immigrants from the north (all speaking dialects of a common language, known as Nahuatl) of which the final wave was represented by the Aztec. The ultimate rise to power of the Aztec resulted in the emigration of large bodies of Toltec from Mexico, and the spread of Toltec influence among the Totonac peoples of Vera Cruz, and the later Maya of Yucatan. An interesting problem is provided by the Huastec people, inhabiting the Panuco Valley, north of the Totonac, and separated by them from the main body of Maya to whom they belong linguistically. Stone sculpture has been found in this area, but no trace of a script. Their pottery bears a close resemblance to the pre-Toltec remains of the Mexican Valley, and to certain, apparently, very early pottery discovered in the Maya Area. They represent apparently, a very early branch of the Maya stock, isolated by the intrusion of immigrant tribes before the great development of Maya culture. Further results of the successive incursions of Nahuatl-speaking tribes from the north are indicated in subsequent paragraphs.

Mexican immigration into Yucatan heralded the disruption of the later Maya Empire. For two centuries the country was controlled by a "triple alliance" between the settlements of Chichén Itzá, Uxmal and Mayapan. Dissension arose and the rulers of Mayapan employed Toltec mercenaries to coerce their allies. The Toltec received Chichén Itzá as the reward of their aid, and erected there some of the most imposing buildings in their own traditional style. Subsequent history is concerned with the internecine feuds of the various clans, and internal strife, complicated by pestilence, had seriously reduced the level of Maya culture by the time that the arrival of the Spaniards extinguished it for ever.

Architecture.—The stone-built settlements consist for the most part of a complex arrangement of pyramidal mounds, often crowned by temples, and other buildings, usually arranged round open courts, in which were erected monolithic stelae and altars. The pyramids are of the "stepped" variety, faced with cut stone blocks, and usually furnished with a stairway on one or more sides. These American mounds, though superficially resembling certain of the pyramids of Egypt, performed a different function. The Egyptian pyramid was fundamentally a tomb; the American pyramid was a substructure for a temple or an altar. Such erections, as a settlement grew in importance, were often enlarged by the addition of another "skin" of masonry. Stone tools alone were available for quarrying and carving, and the remains so far discovered represent a remarkable achievement on the part of a primitive people. The Maya mason was ignorant of the true arch. Buildings were roofed by means of a series of over-stepping courses, which approached one another until they could be united by a series of single slabs. Above this was added a thick layer of solid masonry, and in many cases a lofty "roof-comb," the weight of which kept the false arch firm. But the system entailed great thickness of walls (to withstand the outward thrust of the false arch), and provided for interior chambers only of very restricted width. But the deep entablatures and lofty roof-combs provided a wonderful space for exterior ornamentation, and of this the Maya builder took full advantage. At some sites ornamentation in stucco was applied (notably at Palenque), but in the Later Empire, when the desire for decoration lost all restraint, the stone blocks were carved so that the whole façade of a building became a kind of architectural mosaic. Doorways were usually bridged with wooden lintels, the decay of which has led to the collapse of many of the heavy entablatures. The pillar, as such, was practically non-existent in Old Empire times; broken sections of the wall served the purpose. But as, in later times, buildings became lighter and more commodious, Toltec influence introduced serpent-forms and caryatids (notably at Chichén Itzá). In the erection of buildings relatively small blocks of stone were employed, the

bonding of corners was not practised, and mortar was not used. The rapid growth of tropical vegetation, thrusting its roots between unmortared blocks, is mainly responsible for the collapse of Maya structures. In one site alone, the newly-explored site of Lubaantun in British Honduras, has megalithic building been found. Here a hill-terrace, concealed by later masonry, was revealed by excavation, constructed of huge blocks some of which measure $5 \times 4 \times 2$ feet. But the stelae and altars found at most of the important sites are megalithic; huge blocks of stone, covered with intricate carving, the largest of which (at Quirigua) measures some 25 ft. above ground. These stelae were erected to mark the passing of a *katun* (a period of, roughly, 20 years). At the site last mentioned they were replaced for a certain period by the monolithic figures of grotesque monsters. The quarrying, transport, and sculpturing of such huge blocks constitute a remarkable achievement on the part of artisans working by stone-age methods. (See Holmes in the Bibliography.) The Maya "cities" were not cities in the ordinary sense. They cannot have been citadels, because the most elementary rules of defence are neglected. They were probably observatories and ceremonial centres, inhabited by the priests and chiefs, whither the population at large repaired to perform their religious ceremonies at stated times.

Religion.—The early Maya religion can only be guessed from the accounts given of the beliefs of the later Maya (overlaid by Mexican influence), recorded by Landa and Cogolludo; such echoes as are provided by Mexican ritual; the tribal traditions of the Quiché people of western Guatemala (contained in the *Popol Vuh*, reduced to writing in post-conquest times, but obviously Toltec in origin); and the Maya sculptures and three surviving Maya manuscripts. (For details see the BIBLIOGRAPHY.) The great creator-god of the Maya was Kukulcan (*kukul*=the quetzal-bird; *can*=snake), whose name was literally translated by the Toltec and Aztec as Quetzalcoatl. It appears in the Quiché legends as Gucumatz. His emblem was a feathered serpent, and, in later times, a man with bird and serpent attributes. He was "the feathered snake that goes in the waters," the ripple, born of wind and water, representing breath and movement and therefore life. Another high god was Itzamna, a sky-god, corresponding to the Greek Zeus. He is represented by the Hurakan of the Quiché legend, and exactly paralleled by the Aztec Tezcatlipoca. But more important in popular ritual was the rain-god Chac, whose portrait with pendulous nose is the most frequent in Maya art. The nose was borrowed from the rudimentary trunk of the tapir which was believed to be closely associated with lightning. Highly important also was the death-god, whose portrait as a skull or skeleton is almost as frequent in the sculptures. The sun-god and maize-god appear to have played less important parts, though the former had considerable significance in connection with the calendar. Many other deities of lesser importance are mentioned by the early chroniclers, as presiding over certain arts and occupations (see especially the account of the seasonal festivals given by Landa). On the whole, Maya religion was a worship of the powers of nature, plus a mysterious creator- and culture-god, whose worship was of rather an esoteric nature. In the life of the ordinary individual the rain-god was probably of primary importance, because economic life was based on the maize-plant. Of ritual in the early times practically nothing is known, but all evidence seems to indicate that human sacrifice was not practised. On the other hand blood-offerings were made on the part of individual worshippers by piercing the ears or tongue. Human sacrifice seems to have been introduced into Yucatan from Mexico, and was certainly prevalent there at the time of the Spanish conquest, though it was not practised on the same scale as among the Aztec. Burial customs are obscure, because the climate, both humid and tropical, is not favourable to the preservation of human remains. Both inhumation and cremation were practised by the Maya of Yucatan at the Conquest, but cremation seems to have been restricted to certain ruling families who had immigrated from Mexico in Toltec times and later. Certainly there is no evidence which would associate cremation with the Early Maya.

Social Life.—The social life of the Early Maya can only be guessed. Stone-built settlements of such size, bearing evidence of long occupation, could only have been erected and developed by a large, settled population, held under strong control. The evidence of the monuments implies that this control, in early times, was religious. Presumably many of the figures in Maya sculpture represent chiefs, but in every case the priestly aspect of chieftainship is accentuated. Their equipment is of a highly ceremonial nature, even to their stone-bladed spears and axes. In the Later Empire, the reliefs carved under Toltec influence show real fighting-weapons, barbed throwing spears and hooked spear-throwers. The Spaniards found the inhabitants of Yucatan equipped with bows, which do not appear on the monuments. In brief, the evidence seems to indicate that the early Maya were a peaceable people, ruled by priest-kings. Mexican immigration into Yucatan accentuated the secular side of rulership, especially in connection with leadership in war. Later still, the bow was introduced, again from Mexico, and this weapon, at the time of the Conquest, was particularly associated with the upper classes, who were of immigrant (Nahuatl) stock. The introduction of the bow into Mexico and the Maya region marks a definite phase in the cultural development of Central America. As regards the daily life of the late Maya at the time of the Conquest, details can be found in the works of Cogolludo and Landa and in the *Popol Vuh*. They are epitomized in Joyce (see Bibliography). But the practice of artificial deformation practised by the Maya from the earliest times needs especial mention. A receding forehead was a canon of beauty, and the desired effect was produced by fastening a board across the head of the infant in its cradle. Hence the rather displeasing (to European eyes) physiognomy shown in the monuments. The filing and inlay of the front teeth (with turquoise or obsidian) was also practised, and inlaid teeth are not infrequent in Early Maya burials.

Economic Life.—The basis of the economic life of the Maya was the cultivation of the maize-plant, of which many varieties were found in America at the time of the Discovery. The wild parent-plant has only recently been identified as the "teosinte" (*Euchlaena mexicana*), indigenous to the uplands of Mexico and Guatemala. But the wide gap which separates the two suggests a long period of intensive cultivation, which would relate the beginnings of American culture to a period far anterior to the earliest dated Maya monument, and has a distinct bearing on the question of the indigenous nature of Maya culture. But though maize was the staple, other food-plants were cultivated, such as cacao and beans. Hunting and trapping occupied much of the time of the male population, and bee-keeping was an important industry. Fishing, where rivers and lagoons provided the opportunity, provided a further food-supply, and various food-animals, such as turkeys and geese, were kept in domesticity. The early monuments, which represent in the main only ceremonial scenes, shed little light on the daily life of the early Empire, but there is no reason to suppose that it differed in essentials from that of their descendants in Yucatan as described by Landa and Cogolludo.

Arts and Crafts.—Judged by the highest standards, the Maya were eminent as wood-carvers, stone-workers, potters and weavers. Their achievements are the more remarkable because they were ignorant of any "useful" metal, of the potter's wheel, and of any but the most primitive form of loom. Examples of early Maya wood-carving are excessively rare, owing to climatic conditions, but the few specimens preserved (mostly from the early site at Tikal) show an extraordinary delicacy in relief-treatment. In the handling of stone, especially the monolithic stelae, the Maya mason showed an almost contemptuous mastery of his material. The mere quarrying of such huge blocks, by means of stone tools, is a remarkable feat, apart from subsequent transport and carving. The earliest dated stelae exhibit a "wood" technique; quadrangular pillars with a human figure in relief practically enclosed in the block. Later sculptures show the figure emerging from the block and approximating to the "round." The earliest sculptures show a highly-sophisticated art, conventionalized and overlaid with symbolical details. It is probable that during the

long years which went to the development of Maya culture, wooden monuments were erected which have not survived the climate. In low-relief carving the Maya excelled, and the examples from such sites as Palenque and Menché surpass, in point of perspective, the reliefs of Egypt or Mesopotamia. Sculpture in the round, on a life-size scale, is rare, except at Palenque, but many of the lesser carvings in basalts and jadeites exhibit the same

AN INDIAN OF THE HIGHLANDS OF CENTRAL AMERICA

purity of line and aloof dignity as the reliefs. Maya sculptural art is essentially static, and, owing to its religious basis, often overlaid with symbolical detail; but many of the sculptures express movement, although this feature was lost in the more highly conventionalized sculptures of the New Empire.

The Early Maya were masters in the art not only of stone-cutting and polishing, but of stone-flaking. The implements of chert, chalcedony and obsidian, fashioned both by primary and secondary flaking, can hardly be surpassed throughout the world. The art of pottery-making was highly developed under the Early Maya regime. The wheel was unknown, but the various processes of modelling, coiling and even moulding were practised from early times. Ornamentation was provided by means of painting in slip, by incision in the damp clay, by engraving after sun-drying or firing, or by means of stamps. Forms were extremely varied. Tripod bowls and vertical-sided beakers are especially characteristic, but vases in animal form were not uncommon. Apart from the coarse domestic utensils, Maya pottery shows good quality in paste and firing, and certain of the polychrome varieties are excellent examples of slip-painting. At present, investigation has not proceeded far enough to enable Maya pottery to be classified, save very roughly, in any sort of chronological sequence. An intensive study of Maya ceramics from this point of view would undoubtedly produce results of the highest importance. There is strong indication that certain districts within the Maya area were centres of pottery manufacture, whence the products of the local industry were distributed far and wide by exchange and trade. Further investigation in this direction provides a very promising field of inquiry. Pottery figurines, often in the form of ocarinas, are common, and it is recorded that idols on a comparatively large scale were made by the late Maya in this material. (See Joyce in Bibliography.)

No specimens of textile art belonging to the Maya Period have survived the climate. But the monuments provide ample evidence that the weaver's art had reached a high degree of proficiency. Many of the figures are shown with garments ornamented with inwoven patterns and furnished with embroidered borders and tasselled fringes. All of these exhibit a perfection of technique which, like the stone-carving, implies a long period of development.

It is a little uncertain whether the Maya of the early period were acquainted with metal in any form. The late Maya certainly knew gold, worked it both by hammering and by the *cire-perdue* process, and also used copper to a limited extent, principally for ornaments. But only a single object in gold has been discovered at an early Maya site and this may well be relatively late in date.

MEXICAN PEOPLES

The Nahuatl-speaking Peoples.—In this section the centre of interest is the Valley of Mexico, where Mexico City (Tenochtitlan) was, at the time of the Conquest, the seat of Aztec power. Excavation, principally at Azcapotzalco, has demonstrated that the earliest remains show close affinity with those of the Huastec region, of the Tarascan area (in Guadalajara), and with certain archaic pottery found in the Maya district. Superimposed are objects which can be related with the Toltec, which exhibit a close relation to Maya art of the finer period. Above these are

the inferior relics of the Aztec régime. So far these results suggest that a common culture, based on agricultural life (with maize as the staple plant), extended throughout. The development of Maya culture in the south had very far-reaching effects upon the Mexican Valley, the Zapotec tribes of Oaxaca acting as intermediaries. The successive waves of Nahuatl-speaking tribes, immigrants from the north (fundamentally hunters) adopted this culture when they became sedentary and developed it, though in rather degraded form, according to their own psychology. In brief, the history of the Nahuatl, summarized from legends collected by the early chroniclers (such as Sahagun and Ixtlilxochitl) supplemented by native pictographical manuscripts, appears to be as set out in the accompanying chronological table. This table, taken from Joyce's *Mexican Archaeology*, is explained in detail in that work. The first wave of immigrants appears to have been constituted by the people known to history as Toltec, who, establishing themselves at the "city" of Tula, gradually extended their power over the Valley of Mexico, and absorbed, to the best of their ability, those elements of early Maya culture which had percolated to that region. Three centuries of development followed, during which arts and crafts were brought to a high pitch of perfection. So that, when eventually the Toltec "empire" collapsed under further pressure of hunting tribes from the north, the name of the Toltec survived in tradition as the great exponents of culture. The generic name given to these

later immigrants is "Chichimec." Like the Toltec, they were speakers of the Nahuatl tongue, and the name survived in Aztec times as applied to the rude hunting-tribes on the northern borders, who still lived under the primitive conditions which characterized the earliest Nahuatl immigrants. The terminology is confusing, because in the widest sense the term Chichimec is equivalent to Nahuatl; in the narrower sense it applies to that branch of Nahuatl who settled at Tenayocan, under the "Chichimec" chief Xolotl, at the time of the Toltec downfall, and who appear to have exercised a loose suzerainty over the remaining Toltec, whose legitimate ruler had moved to Colhuacan. The population of this settlement were termed "Acolhua," but the term was later expanded to include all those "Chichimec" who adopted settled life.

The "Chichimec" (using the word in the narrower sense) in course of time transferred their seat of power to Tezcoco. The next wave of immigration, the Tepanec, settled at Azcapotzalco and later at Tlacopan. The final wave, the Aztec, after some years spent in subordination to the earlier immigrants, finally established themselves on the islands of Tenochtitlan and Tlatelolco in the Lake of Mexico, and eventually became rulers, not only of the Valley, but suzerains of countries far to the south. (For details see Bibliography, Joyce.)

The break-up of the Toltec "empire" led to a whole-sale emigration of Toltec clans, which had far-reaching effects on the

populations to the south and east, resulting in the introduction of Toltec art into Yucatan and Salvador. Further pressure sent Nahuatl influence further afield, with the result that, at the time of the Conquest, tribes speaking Nahuatl were found in Nicaragua (Rivas) and even in Panama (Chiriqui Lagoon). It seems certain that the Nahuatl were responsible for the introduction of the bow into the areas previously dominated by Maya culture, and this weapon no doubt facilitated their progress as conquerors. There is no trace of the bow among the early Maya, but references occur in the tribal legends of the Quiché (*Popol Vuh*) and Kakchiquel (*Annals of Xahila*) in the region of Lake Atitlán in Guatemala; and the bow was the weapon of the immigrant aristocracy in Yucatan at the time of the Conquest. Further, the Aztec historical manuscripts show, in pictographic form, the immigrant Aztec, skin-clad and armed with the bow, overcoming the valley-dwellers clothed in cotton garments but armed only with the *macquauitl*, a wooden club edged with obsidian.

Settled on their islands in the Lake of Mexico, for a century the Aztec played an unimportant part in the politics of the Mexican Valley. But under their fourth historical ruler, Itzcoatl, in the early part of the 15th century, owing to intertribal conflicts, they rose to prominence. A league was formed between Tenochtitlan (including Tlaltelolco), the Acolhua settlement of Tezcoco, and the Tepanec settlement at Tlacopan, and this confederation endured until the Conquest. The Aztec reserved for themselves the direction of the military policy of the confederation, and thereby became the paramount power, owing to the intimate connection of war with religion. Tezcoco, however, was, to the end, regarded as the seat of learning and culture, the Mexican "Athens." One settlement alone held its independence, the "city" of Tlaxcala, where Toltec traditions still survived. Though the league maintained continual hostilities against the Tlaxcalans, no very serious effort appears to have been made to conquer them, owing to the ceremonial nature of Mexican warfare as explained below. The long-enduring hostility felt by the Tlaxcalans for the Aztec led them to ally themselves with the Spaniards to whom they gave invaluable assistance.

The final step in the consolidation of the Aztec "Empire" was the incorporation of the island of Tlaltelolco, which had previously been ruled by its own chiefs, with that of Tenochtitlan. This occurred in 1473, when Axayacatl attacked Tlaltelolco, killed the ruler Moquiux and incorporated the smaller island with Tenochtitlan. Axayacatl, by means of various expeditions, extended Aztec influence far beyond the confines of the Valley, and his policy of expansion was continued by his successors. Such expeditions were not conquests in the normal sense of the word, owing to the Mexican attitude towards war; but they resulted eventually in a complex system of trade and tribute, extending from the Panuco River to Central Guatemala. The "tribute-lists" of the Mexican ms. known as the Codex Mendoza (preserved in the Bodleian Library at Oxford) shows the enormous extent of territory from which Mexico City drew "tribute" at the time of the Conquest.

Architecture.—Mexican architecture followed the same lines as that of the Maya, but, in Toltec times led to a development of the pyramid form of substructure to huge dimensions. The site of San Juan Teotihuacan, not far from Mexico city, includes in an enormous complex of mounds, two of the largest of the American pyramids. Aztec tradition associated this site with the name of the Toltec, and recent excavation has revealed sculptured ornament in pure Toltec style. To the west of Mexico, is the well-known low pyramid of Xochicalco, with sculptured decoration of the Toltec period; and in Oaxaca is the large site of Monte Alban, at present unexcavated, but showing, as regards its plan, a close similarity with that of Teotihuacan. Near to the last is the puzzling site of Mitla. The mosaic-sculpture ornament of Mitla is unique in Central America and bears little relation, from the artistic standpoint, to either Maya or Toltec. It is clearly based on textile designs, and resembles very closely the mural decoration of the Northern Peruvian coast, and the painted designs on certain pottery of the Pueblo area of Arizona and New Mexico. This feature, taken into consideration with the fact that

the Mitla buildings were obviously flat-roofed, by means of beams, renders them rather exceptional. It is more than probable that a properly-conducted exploration of the Zapotec sites of Oaxaca would shed much light on the development of early American culture.

Of Aztec buildings, little trace has remained. The two great pyramids of Tenochtitlan and Tlaltelolco, each supporting two shrines, were utterly destroyed by the Conquistadores, but contemporary accounts suggest that they were built on the Toltec model, i.e., stepped pyramids, with a stairway on the west. As regards the shrines, native manuscripts suggest that they were small and flat-roofed, with an embattled pediment, or roof-comb, and built probably of wood. One sole survivor of Aztec religious architecture remains, in ruined form, at Tepoztlan and has been described by Seler. The same author has recorded buildings belonging to the Aztec period in the Huastec and Totonac settlements of Papantla and Cempoala. Both here, and in Mexico City, stucco was freely used as a coating to masonry, and the facing of the Totonac buildings was so perfect that the spies sent in advance by Cortes, reported that they were faced with silver plates.

As regards secular buildings, the reports of the Conquistadores provide the only source of information. The houses of the upper class were built on terraces and constructed of stone. The buildings usually enclosed a court, where the girls of the household could walk under the supervision of duennas; and the roofs of the more important buildings were flat and battlemented. In fact there is little trace of the Maya false arch in Aztec buildings.

Less pretentious dwellings were constructed of sunbaked bricks (*adobe*), while the poorest class lived in flimsy structures of reeds and mud, roofed with straw of leaves of *maguey*.

A remarkable architectural achievement on the part of the Aztec was the series of causeways which connected the island with the mainland. In building them, a double palisade was first erected and the space between filled with earth and rubble and faced with stones. The great dam, which led from Iztapalapa to Atzacualco (built by Montecuzoma I. on the advice of Nezahualcoyotl of Tezcoco), was ten miles long, perforated by sluices and was erected in an attempt to control the inundations to which Tenochtitlan was subject. Another work of great economic importance was a double stone aqueduct, which brought water to the city from Chapultepec.

Religion and Burial.—Mexican religion, at the time of the Conquest, was of a highly composite nature; this feature is founded on the history of the people in their role as immigrant conquerors, and is apparent even in Toltec times, although little detail has survived concerning this early people. The Toltec, like all the Nahuatl tribes in their migratory days, were led by chiefs who were also priests. In the case of the Toltec, after they settled in the Valley of Mexico, the priestly side of "kingship" became accentuated, and the gods who presided over the sedentary arts and crafts (which were of necessity borrowed from the people of the valley), became of greater importance. So Quetzalcoatl, the god of Arts and Crafts, of the Calendar, and of general culture, was adopted by the Toltec as their own particular divinity. The word Quetzalcoatl, as explained above, is a literal translation of the name of the great Maya god, Kukulcan, who bore the same attributes of combined bird and snake. Of almost equal importance was the god Tlaloc, the god of rain, the counterpart of the Maya *Chaac*. The Nahuatl nomads, when they took to settled life based on agriculture, were forced to borrow the gods of the sedentary population upon whom they imposed themselves, and these gods, or at least the most important of them, were almost certainly derived from the Maya. The original tribal gods of the Nahuatl people were hunting- and war-gods, connected with the stars rather than with the sun, and they could hardly be expected to know anything about agriculture or the arts based on settled life. All evidence seems to show that the Toltec, being the first-comers were more influenced by such elements of Maya religion as had permeated to Mexico than the subsequent immigrants. The latter, especially the Aztec, while accepting the local deities of agriculture and craftsmanship, main-

tained the worship of their tribal god, whom they often invested with qualities and powers borrowed from the adopted deities. A case in point is the Aztec tribal god, Uitzilopochtli, at first a stellar-war- and hunting-god; later associated with the sun, and finally imposed as the most important deity in ritual upon all the tributaries within the Aztec "Empire." The growth of sun-worship is interesting. Certainly the early Maya worshipped a sun-god, and there are indications that he was associated with war, but there is little evidence that either the sun-god or war were of great importance in religious or secular life. But, under the Aztec régime, war, intimately connected with sun-worship, became a religious duty, because the belief had arisen that the sun needed the blood of human hearts as nourishment, and war was necessary in order to procure prisoners for sacrifice. The ceremonial nature of war is a most important feature of Aztec "civilization." The object of war was the capture of prisoners, not the killing of enemies, and warriors obtained promotion in accordance with the number of prisoners which they took. A state of peace within the sphere of Aztec influence would have been a religious calamity; the Aztec therefore held their dependencies very lightly and were not in the least averse to revolt, but rather welcomed it. The introduction and development of human sacrifice (which was not practised by the early Maya) into the Mexican valley, is, according to tradition, responsible for the breakup of the Toltec "Empire" and the migration of Toltec clans eastwards and southwards. In Aztec times the practice was the normal accompaniment of nearly all religious festivals, and had attained such proportions that, according to the native mss. no less than 20,000 human victims were slaughtered on the occasion of the dedication of the great pyramid in Tenochtitlan in the reign of Auitzotl. In Mexican sacrifice, the essential feature was the offering of the heart, but variations of the normal ritual prevailed in ceremonies held in honour of specific deities, many of which had been adopted from surrounding tribes. For instance, the victims offered to the fire-god were thrown into a huge fire before the heart was extracted; the female victims offered to the fertility goddesses were decapitated (a rite representing, symbolically, the reaping of the maize-cob); the prisoners offered to Xipe (the god of young vegetation) were flayed, and their captors wore the skins for the duration of the festival. The casting off of the dead skins, which was performed ceremonially, was a magico-religious act, and was supposed to assist in the resurrection of the food-crop. Mexican religion, though often revolting in its expression, was based on the idea that the powers of nature needed continual regeneration which could only be afforded by human aid in the form of personal sacrifice. Death on the sacrificial stone was the same as death in war; the normal death of a fighting-man; and each was the avenue to the Paradise of the Sun. Most of the victims were identified with the god to whom they were sacrificed, but the principal instance is the youth who was offered up at the feast of Toxcatl held in honour of the High-god Tezcatlipoca. Tezcatlipoca was the "Jupiter" of the Nahuatl pantheon, worshipped by all in common, a creator- and sky-god. The chosen victim was not only his representative, but the vehicle which enabled the god-spirit to associate with mankind, and so ensure the prosperity of the community. But it was essential that the god-spirit should not be weakened by the decay which is the heritage of mortals, consequently the human vehicle, after living in divine state for a year, was sacrificed, and the spirit transferred to another predestined victim in the prime of youth.

Ceremonial cannibalism was an occasional feature of sacrifice, certain individuals being privileged to partake of the body of the victim. But the act was purely ritual, and, in fact, an act of communion, for which many parallels can be found in other parts of the world.

To Quetzalcoatl no human sacrifices were made, and, as it is clear that this god was originally adopted from the early Maya, further support is given to the theory that human offerings were introduced into Mexico by the Nahuatl immigrants.

The composite nature of Aztec religion is equally expressed in the method of disposing of the dead. Both cremation and inhumation were practised, but the two methods bore a definite

relation both to the method of death of the individual, and to the worship of certain gods. The fate of the soul varied accordingly. Men killed in battle or by sacrifice reached the Paradise of the Sun; women dying in child-birth had a paradise of their own, because their death was considered a warrior-death. Persons who were drowned, or who perished of dropsical affections were accommodated in a separate paradise belonging to the pre-Aztec fertility- and rain-god Tlaloc. People dying normally had only the dim underworld of the death-god, Mictlantecutli, as their future abode. Cremation was the fate of all except those who were destined for Tlaloc's paradise. This fact affords a clear indication that inhumation was the early form of funerary rite, and that cremation was introduced by the Nahuatl immigrants. Much has been recorded on the subject of Mexican religion, the gods, their respective ritual and feast, their attributes and tribal affinities. For details see Bibliography under Sahagun, Seler and Joyce.

In their contest with the Spaniards the Mexicans were, in a sense, betrayed by their own religion. There was an ancient legend that the great culture-god, Quetzalcoatl, after instructing the people in the useful arts, departed eastward over the sea, promising to return in a year of a certain date. According to tradition, Quetzalcoatl was white-skinned and bearded and the arrival of the Spaniards, in the appropriate year, led Montecuzoma II., who had been trained as a priest, to adopt a fatally hesitating policy towards them. Again, the fact that the Aztec fought, not to kill, but to capture, on more than one occasion saved the small force of Cortéz from annihilation.

Economic Life.—As in the case of the Maya, the economic life of the Mexicans was based fundamentally on maize-cultivation. Since the Aztec, in the earlier period of their settled life, occupied only a very restricted land-area, cultivation was intensive, and the practice of manuring the fields, rare among primitive peoples, had been systematically developed. Even the waters of the lake were pressed into service, and many food-plants were grown on floating rafts loaded with soil. The lake and its marshes provided abundance of fish and wild-fowl, and on the mainland, deer, rabbits and various game-birds afforded a plentiful supply of flesh-food. Two plants of great economic importance need mention. First the cacao, from which the drink known as *chocolatl* (whence our "chocolate") was prepared. Second the *maguey* or Mexican aloe (*agave americana*), the various uses of which are best described in the words of one of the conquerors. "This tree is of the greatest utility. From it is made wine, vinegar, honey, a syrup-like grape-juice. They employ it (*i.e.*, the fibre) in the manufacture of garments for men and women, for foot gear, ropes, the ties used in building houses, the roofing of these houses (the leaves), for sewing needles (the spines), for dressings for wounds and other purposes." From the sap an intoxicating drink was prepared, known as *octli* (at the present day, *pulque*), indulgence in which, however, was controlled by law. Tobacco was smoked in tubes. The hunting instinct of the Aztec, after they became a settled people, found a free vent in trade, and one of the most important sections of the community was the guild of *Pochteca*, or travelling merchants. These grew to be a privileged class, worshipping special gods, and practising private ceremonies. Their extended wanderings helped to spread Aztec influence far into Guatemala and other districts to the south and east, and, apart from their position as traders, they played the part of military spies. The death of one of these merchants, at the hands of a foreign tribe, was never left unavenged in the days of the Aztec supremacy, but afforded an excuse for a military expedition which brought further tribute and sacrificial victims to Tenochtitlan. The economic prosperity of this city at the time of the conquest is amply illustrated in the account of the great mart at Talatelolco, described by the so-called "Anonymous Conqueror," and the tribute lists of the Mendoza Codex.

Arts and Crafts.—The Nahuatl tribes, after their settlement, knew and worked gold, silver and copper. Of these, copper alone is useful as a tool, and its use is very limited. In the main, therefore, implements were made of stone or of the natural glass known as obsidian. Expert as they were in the flaking of these materials,

their products do not attain the perfection of the Maya or Zapotec; but their technique in the manufacture of implements, masks, bowls and so forth, of polished stone, obsidian jadeite and crystal, is remarkable. Such works of art were produced by the lengthy process of rubbing and the free use of sand. Hollows were cut by means of tubular drill of cane, also armatured with sand, and the final polish was given with bamboo. To the Aztec, the Toltec were the great masters of stone-cutting, and most, if not all, of the late Mexican lapidaries were of Toltec descent. The Aztec themselves were warriors and political organizers. Nearly all the industrial pursuits were in the hands of close clan-corporations, the great majority of which claimed Toltec ancestry. These industrial corporations worshipped special gods, and practised ceremonies of their own (details in Sahagun and Joyce). Perhaps the most spectacular examples of the lapidaries' art are the mosaics of turquoise, lignite, shell and pyrites, applied, usually, to a wooden foundation, which are amply described in Saville's monograph (see Bibliography).

Metal-working in Mexico was, in the main, confined to gold, and there were two separate "guilds" of gold-workers, the beaters and the casters. Casting was done by means of the "cire-perdue" method, and the same process was employed, especially by the Totonac, in dealing with copper, which, owing to the presence of a percentage of tin (as an impurity) was, in fact, an accidental bronze. Gold-foil, of extreme thinness, was produced by the beaters, and frequently applied to wood-carving. Many works of art, known to us by description, have perished in the melting-pot being composed of a metal precious in European economy, with the result that Mexican gold-work is extremely rare in Museums. Wood was used both for building and in the manufacture of various utensils and instruments, especially gongs (*teponaztlí*), but, owing to the perishable nature of the material, specimens are scarce (see Saville, Bibliography). The art of the potter flourished in Mexico, and though the wheel was unknown, certain classes of ware are remarkable for the perfection of their shape, firing and decoration. For the most part the coiling process was employed, but the use of moulds was also known. The pottery of the Aztec is distinctly inferior from every point of view. Toltec ware shows close affinities with the Maya, but exhibits in the most characteristic examples a peculiar "cloisonné" technique, in which a dark slip, added to the surface of the pot has been cut out to form outlines, and slips of other colours, principally turquoise-blue, inlaid between them. Ware of this class is found in the Totonac area of Vera Cruz, and bears witness to the close association of the Totonac with Toltec culture. But such examples are rare, and as regards the two qualities of form and firing, Totonac pottery (of which the most notable series is preserved in the British Museum), represents the finest achievement of the Mexican potter. In colour and burnish, however, the pottery of Cholula (in the state of Puebla), and of the Zapotec, are paramount. The two classes of ceramic ware show very close similarities, and the colours employed are those of the finest Maya pottery. Puebla was peopled by clans of Toltec origin and the Zapotec country had been permeated by Maya influence. The inference is that the population of Puebla had received, through the Zapotec, the tradition of Maya colouration. In any case under the late Aztec régime, the potters of Cholula were regarded as the masters of the ceramic art, and the table-ware of Montecuzoma and the Aztec nobles was provided by this province.

Good pottery was manufactured also by the Huastec and Tarascans, the large figurines of the latter people showing conspicuous freedom and originality in modelling.

The textile art was developed to a high degree by means of a very simple form of loom. Patterns of the most intricate type were inwoven or embroidered, and one of the most important dyes was that produced by the cochineal insect, which constituted an important item of tribute to Mexico City. Very few Mexican textiles have survived, but the native mss. bear witness to the perfection of technique and brilliancy of colouring.

The art of feather-mosaic was extensively practised in Aztec times. Complicated designs were produced by the meticulous application of the small feathers of tropical birds to a background

of cloth or maguey (aloe) paper. Practically all the surviving specimens relate to post-conquest times, when, under the influence of missionaries, numbers of sacred pictures were produced in this technique. Complicated arrangements of feathers, secured to a bamboo framework, were worn by warriors of different ranks attached to the back, and military standards were constructed of the same materials. Art can best be studied in Museums, or by

UNLOADING A SQUARED MAHOGANY LOG AT THE RIVER BANK FROM A PRIMITIVE, HIGH-WHEELED TRINQUIVAL

means of well-illustrated books devoted to this subject (see Joyce, Bibliography). Toltec art shows a very close correspondence with that of the Maya, with a tendency to stylization in angular form. The flowing line was not lost, but the increased conventionalism often gives to Toltec art a slightly "mechanical" aspect. In Aztec times the angularity is accentuated in the mss., but in sculpture there is a great tendency towards simplification combined with a subtle suggestion of ferocity.

Social Life.—The Nahuatl-speaking tribes, being nomadic, were controlled originally by chiefs who were skilled warriors and hunters, supported by an advisory council of elders. Since these tribes recognized gods of their own, who were regarded as tribal leaders, the function of the priest became immensely important. In many cases the office of chief and priest was combined and the priestly aspect of the Toltec rulers is very clearly expressed in tradition. The Toltec were more affected by the eminently peaceful sociology of the Maya than their successors, and the priestly side of "king-ship" became accentuated. Later, successive immigrations of warlike tribes, and the development of the ceremonial importance of war, as the means of procuring victims for sacrifice, led, in Aztec times, to a reversion to type. The Aztec ruler held his position as the supreme war-lord, while the religion, complicated owing to the incorporation of alien gods and their respective ritual, fell into the hands of a specialist priesthood. When the nomadic Nahuatl descended on the Mexican Valley they were faced with a question which was outside their experience. In adopting a settled, agricultural life, they were suddenly aware of the value of land. None of their gods had any control over land, or its produce. The Toltec were the first in the field; later intruders based their territorial claims on intermarriage with women of Toltec stock. The legendary history, combined with the later Aztec practice, whereby brother succeeded brother (under normal circumstances), and, after the extinction of the generation, the succession reverted to the eldest nephew, suggests that rank-inheritance was transferred through the female line. In the latest times, however, this rule was not without exceptions, because, owing to the growing importance of war as an integral part of religion, it was necessary for the candidate for rulership to have passed a certain military rank. The fact that the last Montecuzoma had been trained both as a priest and a warrior, led him, when white strangers arrived in the year of prophecy, to adopt a vacillating policy which resulted in the downfall of his "empire."

The Aztec showed great political genius in the system which they devised for the control of the various peoples from whom they extracted "tribute." They dared not abolish war, because war brought the prisoners which their gods demanded as sacrifice. So, as a rule, they allowed the subject tribes to maintain their own system of government and individual rulers, with the fixed intention of making "punitive" raids on the least excuse.

The inner social system of Mexico under Aztec domination

Chronological Table showing, on the broadest lines, the Time-relation, between the Main Cultural Areas of Central and South America, suggested by archaeological results so far obtained (1927)

| Southern Mexico, Guatemala, British Honduras and Northern Honduras | Central Mexico | Approximate date | Peru and Bolivia (Highlands) | Peru south coast | Peru north coast | Ecuador |
|--|---|------------------|--|------------------------|------------------|--|
| Early Maya | Primitive culture allied to the Huastec and later Tarascan. | A.D. 200 | Tiahuanaco I. | Proto-nasca | Proto-chimu | Pre-Inca, probably related to Proto-Chimu. |
| Middle Maya | | Tiahuanaco II. | Inferior remains at present unclassified | | | |
| Late Maya (with Toltec and, later, Aztec influences) | | | | | | |

| Spanish conquest | | A.D. 1533 | Spanish conquest | | | |

provides all the features which might be expected from the incursion of immigrants, who acquired land-interests, either by right of conquest or by intermarriage with the daughters of local chiefs. The conquering chiefs gave land to their principal retainers, and these formed an aristocracy who paid no taxes but owed feudal service to the ruler. Associated with them was a military nobility, who held estates at the ruler's good-will, and whose tenants paid royal taxes. Next came a class of landed freemen, members of "clans," known as *calpulli*. These *calpulli* distributed the land over which they had rights among their members, but any member who, whether by carelessness or by change of abode, allowed his plot to go out of cultivation, lost his holding. The *calpulli* paid taxes in common. Below the freemen ranked the tax-paying rent-holders, and, finally the serfs who paid taxes only to their feudal lords. Apart from these were the members of the official class and their families, who, ranking as warriors and "nobles," paid no taxes, but contributed their personal services, and formed the suite of the ruler. To provide for the education both of the artisan and upper classes full provision was made. The exercise of certain pursuits was in the hands of close corporations (mainly of different tribal stocks); but apart from technical specialists, provision was made for the "higher education" of children. The institution known as the Calmecac provided the education for those who desired to adopt a priestly career, and was under the especial protection of the god Quetzalcoatl, while the candidates for military service entered the Telpochcalli, where, under the aegis of the god Tezcatlipoca, they received a military training. Details of the Aztec constitution are readily available in the works of Sahagun, and the compilation of Joyce (*see Bibliography*).

Nicaragua, Costa Rica and Panama.—Archaeological research in these countries is not as yet sufficiently advanced to enable a connected picture to be drawn of the economic life of the more cultured inhabitants of this area. Intensive excavation, on scientific lines, has been carried out in certain areas, but the gaps are wide. In particular so little is known about southern Honduras and Nicaragua that the southern limit of Maya cultural influence is undefined. Nahuatl colonies existed beyond doubt in the Department of Rivas in Nicaragua, in the peninsula of Nicoya (Costa Rica), and on the edge of the Chiriqui lagoon (Panama). In all of these districts the Nahuatl language was found. In Nicoya and Rivas the pottery shows strong Nahuatl affinities. And in Rivas religion and ritual were purely Mexican in character, as is proved by Oviedo's account. From central Costa Rica, southwards and eastwards, the flora, fauna and ethnography begin to approximate to those of the Southern Continent. The wall-less hut-shelter takes the place of the walled hut; the hammock makes its appearance; cassava (manioc) plays a more and more predominant role as a food-plant. The tribes inhabiting this region have been classified on linguistic lines, and show a great diversity of speech (for details *see* Thomas, Swanton and

Lehmann, in the Bibliography). The archaeological areas cross the political boundaries of the present Republics so that it is impossible to discuss the archaeology of each in detail without constant repetition. All available material has been summarized in Joyce's compilation (which includes a full bibliography), and Lothrop's later work (*see Bibliography*).

In Nicaragua stone-building on the scale practised by the Maya and Aztec was unknown, but monolithic sculptures, some of considerable size, have been found on the islands in lakes Managua and Nicaragua. These are not Nahuatl in style, and are believed to have been the work of the Chorotega people, who probably occupied a wider area in ancient times than is indicated by later linguistic surveys. Archaeological evidence, slight as it is, suggests that their original territory was reduced by the expansion of the Matagalpa, Sumo and Ulua peoples. They manufactured good painted pottery, and it is quite possible that their art was a reflection of that of the Maya; but far more exploration is necessary in Honduras before the connection can be proved. The Nicaraos (or Niquirian) people in Rivas, were of comparatively late Nahuatl stock, but the pottery found in the area possesses finer qualities than that of the Aztec. Though stone-carving on a large scale is rare, yet the Nicaraguans and Northern Costa Ricans produced smaller examples of sculpture, in the form of figures, bowls and, especially, metates (tripod slabs for grinding maize). In the peninsula of Nicoya, jadeite was worked with great skill, and pendants in the Nicoyan style have been found in regions north and south of the district. Probably more worked jadeite has been recovered from Nicoyan cemeteries than anywhere else in America, yet the source of the material is still unknown. The Nicoyans represent a definite linguistic unit to-day, but archaeological evidence proves, that in the heart of the peninsula was an enclave of Nahuatl immigrants, who manufactured pottery of extremely good technique (both as regards paste and coloured decoration) in which the Mexican tradition is obvious.

On the mainland, opposite the Nicoyan peninsula, is a strip of territory (in Costa Rica) occupied by the Guetar people whose ancient cemeteries have yielded quantities of polychrome pottery, which, though inferior in colour to that of Nicoya, and, again, inferior in quality of paste to that of the tribes to the south and east, nevertheless shows great variety and takes a high rank in the scale of primitive ceramics. In southern Costa Rica, and western Panama, inhabited for the most part by Talamancan tribes, the potter's art was developed to a degree which has its only parallel in Peru. In the quality of technique the so-called "biscuit-ware" of the Talamancans is unsurpassed in the history of hand-made pottery, and the sense of form exhibited in these vases is beyond reproach. In slip-decoration the brilliancy of colour is inferior to that of the ware of Cholula or Oaxaca, and, especially that of Southern Peru. But the Talamancans were masters of the so-called "lost colour" process, whereby elements

of a design were "reserved" by wax-painting on a slip of a certain colour. Upon this a second slip of another colour was added, which, in the firing was released from the waxed portions. Pottery of this class is common in Colombia and Ecuador, and occasional in Peru, while its occurrence in the Isthmian region emphasizes the connection of the Talamancan region with the southern continent. Further evidence of this connection is provided by the gold-work, recovered in large quantities from Talamancan cemeteries. Pendants in human and animal form have been obtained in considerable bulk from this area. The raw material was obtained by the laborious process of picking out grains of gold from river-sands, and the ornaments were partly cast (by the *cire-perdue* process), and finished by hammering. The same processes prevailed in Colombia, and it is not easy to distinguish the products of the two regions. Between the Talamancan district and the southern continent lay a densely forested area, peopled by tribes of lower culture, but on the Pacific coast, especially in the gulf of San Miguel, the first Spanish explorers found settlements engaged in pearl-fishery and a coastal trade southwards. From a chief named Tumaco they received an itinerary by sea to Peru, then undiscovered, and an allusion, in vague terms, to the great Inca Empire. (See Joyce, Bibliography.)

Inter-tribal traffic had attained a high degree of development in Central America. The jadeite work of Nicoya is found sporadically in southern Costa Rica, while the gold-work of the Talamancan area has been discovered, not only in Nicoya, but even at Chichén Itzá in Yucatan. The Isthmian region in every respect, flora, fauna and ethnography, combines the characteristics of both North and South America. Apart from the interchange of commercial products by hand-to-hand trade, Mexican influence from the north introduced the practice of cremation into certain restricted areas, where it impinged on certain technical processes (pottery and gold-work) characteristic of the Southern Continent.

BIBLIOGRAPHY.—*Maya and Mexican*: The most important bibliographical work is Dr. Walter Lehmann's *Methods and results in Mexican research*, a version, in English, published in Paris, in 1909, of a paper originally appearing in the *Archiv für Anthropologie*, vol. vi., 1907. The *Manuel d'Archéologie Américaine* of H. Beuchat (Paris, 1912) also contains a full bibliography. *Mexican Archaeology* by T. A. Joyce (1914), is a compilation which gives a full account of Mexican and Maya culture, of which the bibliographies in the works of Lehmann and Beuchat indicate the sources. Special mention may be made of Maudslay's *Biologia Centrali-Americana* (1889-1902); Seler's *Gesammelte Abhandlungen* (1902 onward); the British Museum *Guide to the Maudslay Collection of Maya Sculptures* (1923), with particular reference to the select bibliography appended thereto; *Maya and Mexican Art*, by T. A. Joyce (1927) deals in the main with the arts and crafts of the peoples. Some of the following works are quoted in the bibliographies mentioned above, but are repeated here for convenience. For details concerning the life and beliefs of the Yucatec Maya see especially Diego de Landa, *Relacion de las Cosas de Yucatan*, a French translation of which was published by Brasseur de Bourbourg in 1864; Cogolludo, *Historia de Yucatan*, Madrid, 1688. Similar contemporary works relating to the Aztec are Bernal Diaz *History of the Conquest of New Spain*, edited by A. P. Maudslay, Hakluyt Society, series II., vols. 23, 24, 25, 30 and 40), the account of the "Anonymous Conqueror," published in French by Ternaux-Compans, and in English by the Cortez Society (edited by M. H. Saville, New York, 1917); and those portions of the mss. of Bernadino de Sahagun which have been published, viz., *Histoire Générale des Choses de la Nouvelle Espagne* (edited by D. Jourdanet and R. Simeon, Paris, 1880), and Seler's posthumous edition, containing much hitherto unpublished material (Stuttgart, 1927). Special works relating to Maya architecture (besides Maudslay, mentioned above) are as follows (a star indicates a bibliography):—W. H. Holmes, *Archaeological Studies amongst the Ancient Cities of Mexico* (Field Museum, Chicago, 1895 and 1897); H. J. Spinden, *A Study of Maya Art**, Memoirs Peabody Museum vol. vi. (Cambridge, Mass., 1913); S. K. Lothrop, *Tulum** (Carnegie Institution, Washington, 1924); and certain chapters in Joyce's works (see above). As regards other arts and crafts, the three monographs by M. H. Saville, published by the Museum of the American Indian, New York, are of importance, *The Goldsmith's Art in Ancient Mexico** (1920), *Turquoise Mosaic Art in Ancient Mexico** (1922) and *The Wood-Carver's Art in Ancient Mexico** (1925). *Nicaragua, Costa Rica and Panama*: Extensive bibliographies, covering the whole of the literature relating to the archaeology of these countries may be found in the following three works: H. Beuchat, *Manuel d'Archéologie Américaine* (Paris, 1912); T. A. Joyce, *Central American Archaeology* (London, 1916); and S. K. Lothrop, *Pottery of Costa Rica and Nicaragua* (Museum of the American Indian, New York, 1926). For linguistics see C. Thomas and J. R.

Swanton, *Indian languages of Mexico and Central America* (Bulletin 44, Bureau of American Ethnology, Washington, 1911). (T. A. J.)

CENTRAL AND NORTH AMERICAN LANGUAGES. The population of aboriginal America north of Mexico (about 1,150,000), at the time of the discovery of America by Columbus, spoke an astonishing number of languages, most of which are still spoken, though in many cases by only a bare handful of individuals. Certain of them, like Sioux and Navaho, are still flourishing languages.

They consist of a number of distinct stocks, which differ fundamentally from each other in vocabulary, phonetics and grammatical form. Some of these stocks, such as Algonkin, Siouan and Athabaskan, consist of a large number of distinct languages; others seem to be limited to a small number of languages or dialects or even to a single language. The so-called "Powell classification" of languages north of Mexico recognizes no less than 55 of these "stocks" (see the revised map of 1915 issued by the Bureau of American Ethnology), excluding Arawak, a South American stock originally represented in the West Indies and perhaps also on the southwestern coast of Florida.

The distribution of these 55 stocks is uneven; 37 of them are either entirely or largely in territory draining into the Pacific, and 22 of these have a coast line on the Pacific. Only 7 linguistic stocks had an Atlantic coast line. Besides the Pacific coast, in the lower Mississippi and Gulf coast, languages of 10 stocks were spoken (apart from Arawak). The most widely distributed stocks are: *Eskimoan*, which includes Eskimo dialects ranging from east Greenland west to southern Alaska and East Cape, Siberia, as well as the Aleut of Alaska Peninsula and the Aleutian Islands; *Algonkian*, which embraces a large number of languages spoken along the Atlantic coast from eastern Quebec and Cape Breton Island south to the coast of North Carolina, in the interior of Labrador, in the northern part of the drainage of the St. Lawrence, in the country of the three upper Great Lakes and the upper Mississippi, and west into the plains of the Saskatchewan and the upper Missouri; *Iroquoian*, which consists of languages originally spoken in three disconnected areas—the region of Lakes Erie and Ontario and the St. Lawrence, eastern Virginia and North Carolina, and the southern Alleghany country (Cherokee); *Muskogian* (including Natchez), which occupies the Gulf region from the mouth of the Mississippi east into Florida and Georgia and north into Tennessee and Kentucky; *Siouan*, divided into four geographically distinct groups—an eastern group in Virginia and North and South Carolina, a small southern contingent (Biloxi) in southern Mississippi, the main group in the valley of the Missouri (eastern Montana and Saskatchewan southeast through Arkansas), and a colony of the main group (Winnebago) in the region of Green Bay, Wisconsin; *Caddoan*, spoken in the southern Plains (from Nebraska south into Texas and Louisiana) and in an isolated enclave (Arikara) along the Missouri in North and South Dakota; *Shoshonean*, which occupies the greater part of the Great Basin area and contiguous territory in southern California and the southwestern Plains (Texas), also, disconnected from this vast stretch, three mesas in the Pueblo region of northern Arizona (Hopi); *Athabaskan*, divided into three geographically distinct groups of languages—Northern (the valleys of the Mackenzie and Yukon, from just short of Hudson's Bay west to Cook Inlet, Alaska, and from Great Bear Lake and the Mackenzie delta south to the headwaters of the Saskatchewan), Pacific (two disconnected areas, one in southwestern Oregon and northwestern California, the other a little south of this in California), and Southern (large parts of Arizona and New Mexico, with adjoining regions of Utah, Texas and Mexico)—besides isolated enclaves in southern British Columbia, Washington and northern Oregon; and *Salishan*, in southern British Columbia, most of Washington, and northern Idaho and Montana, with two isolated offshoots, one (Bella Coola) to the north on the British Columbia coast, the other (Tillamook) to the south in northwestern Oregon.

The remaining 46 stocks, according to Powell's classification, in alphabetical order, are: *Atakapa* (Gulf coast of Louisiana and Texas); *Beothuk* (Newfoundland; extinct); *Chimakuan* (northwestern Washington); *Chimuriko* (northwestern California);

Chinook (lower Columbia river, in Washington and Oregon); *Chitimacha* (southern Louisiana); *Chumash* (southwestern California); *Coahuiltecan* (lower Rio Grande, in Texas and Mexico); *Coos* (Oregon coast); *Costanoan* (western California south of San Francisco Bay); *Esselen* (southwestern California; extinct); *Haida* (Queen Charlotte Islands and part of southern Alaska); *Kalapuya* (northwestern Oregon); *Karankawa* (Texas coast); *Karok* (northwestern California); *Keres* (certain Rio Grande pueblos, New Mexico); *Kiowa* (southern Plains, in Kansas, Colorado, Oklahoma, and Texas); *Kootenay* (upper Columbia river, in British Columbia and adjoining parts of Idaho and Montana); *Lutuami*, consisting of Klamath and Modoc (southern Oregon and northeastern California); *Maidu* (eastern part of Sacramento valley, California); *Miwok* (central California); *Piman* or *Sonoran* (southern Arizona and south into Mexico as far as the state of Jalisco); *Pomo* (western California north of San Francisco Bay); *Sahaptin* (middle Columbia River valley, in Washington, Oregon and Idaho); *Salinan* (southwestern California); *Shastan* or *Shasta-Achomawi* (northern California and southern Oregon); *Takelma* (southwestern Oregon); *Tanoan* (certain pueblos in New Mexico, Arizona, and originally also in Chihuahua, Mexico); *Timuqua* (Florida; extinct); *Tlingit* (southern Alaska); *Tonkawa* (Texas); *Tsimshian* (western British Columbia); *Tunica* (Mississippi River, in Louisiana and Mississippi); *Wailatpuan*, consisting of Molala and Cayuse (northern Oregon); *Wakashan*, consisting of Kwakiutl and Nootka (coast of British Columbia); *Washo* (western Nevada and eastern California); *Wintun* (north central California); *Wiyot* (northwestern California); *Yakonan* (Oregon coast); *Yana* (northern California); *Yokuts* (southern California); *Yuchi* (Savannah river, in Georgia and South Carolina); *Yuki* (western California); *Yuman* (lower Colorado River valley, in Arizona, southern California and south into all or most of lower California); *Yurok* (northwestern California); *Zuni* (pueblo of New Mexico). To these was later added, as distinct from Yakonan, *Siuslaw* (Oregon Coast).

This complex classification of native languages in North America is very probably only a first approximation to the historic truth. There are clearly far-reaching resemblances in both structure and vocabulary among linguistic stocks classified by Powell as genetically distinct. Certain resemblances in vocabulary and phonetics are undoubtedly due to borrowing of one language from another, but the more deep-lying resemblances, such as can be demonstrated, for instance, for Shoshonean, Piman, and Nahuatl (Mexico) or for Athabaskan and Tlingit, must be due to a common origin now greatly obscured by the operation of phonetic laws, grammatical developments and losses, analogical disturbances, and borrowing of elements from alien sources.

It is impossible to say at present what is the irreducible number of linguistic stocks that should be recognized for America north of Mexico, as scientific comparative work on these difficult languages is still in its infancy. The following reductions of linguistic stocks which have been proposed may be looked upon as either probable or very possible: 1, *Wiyot* and *Yurok*, to which may have to be added Algonkian (of which Beothuk may be a very divergent member); 2, *Iroquoian* and *Caddoan*; 3, *Uto-Aztekan*, consisting of Shoshonean, Piman and Nahuatl; 4, *Athabaskan* and *Tlingit*, with *Haida* as a more distant relative; 5, *Mosan*, consisting of Salish, Chimakuan and Wakashan; 6, *Atakapa*, *Tunica* and *Chitimacha*; 7, *Coahuiltecan*, *Tonkawa* and *Karankawa*; 8, *Kiowa* and *Tanoan*; 9, *Takelma*, *Kalapuya* and *Coos-Siuslaw-Yakonan*; 10, *Sahaptin*, *Wailatpuan* and *Lutuami*; 11, a large group known as *Hokan*, consisting of Karok, Chimariko, Shastan, Yana, Pomo, Washo, Esselen, Yuman, Salinan, Chumash, and in Mexico, Seri and Chontal; 12, *Penutian*, consisting of Miwok-Costanoan, Yokuts, Maidu and Wintun.

A more far-reaching scheme than Powell's, suggestive but not demonstrable in all its features at the present time, is Sapir's.

These linguistic classifications, shown in the next column, do not correspond at all closely to the racial or sub-racial lines that have been drawn for North America, nor to the culture areas into which the tribes have been grouped by ethnographers. Thus, the Athabaskan stock counts among its tribes repres-

*Proposed Classification of American Indian Languages North of Mexico
(and Certain Languages of Mexico and Central America)*

I. Eskimo-Aleut

II. Algonkin-Wakashan

- | | |
|--------------------|--------------------------------|
| 1. Algonkin-Ritwan | 2. Kootenay |
| (1) Algonkin | 3. Mosan (Wakashan-Salish) |
| (2) Beothuk (?) | (1) Wakashan (Kwakiutl-Nootka) |
| (3) Ritwan | (2) Chimakuan |
| (a) Wiyot | (3) Salish |
| (b) Yurok | |

III. Nadene

- | | |
|----------|-----------------------|
| 1. Haida | 2. Continental Nadene |
| | (1) Tlingit |
| | (2) Athabaskan |

IV. Penutian

- | | |
|---------------------------|--------------------------------|
| 1. Californian Penutian | 3. Chinook |
| (1) Miwok-Costanoan | 4. Tsimshian |
| (2) Yokuts | 5. Plateau Penutian |
| (3) Maidu | (1) Sahaptin |
| (4) Wintun | (2) Wailatpuan (Molala-Cayuse) |
| 2. Oregon Penutian | (3) Lutuami (Klamath-Modoc) |
| (1) Takelma | 6. Mexican Penutian |
| (2) Coast Oregon Penutian | (1) Mixe-Zoque |
| (a) Coos | (2) Huave |
| (b) Siuslaw | |
| (c) Yakonan | |
| (3) Kalapuya | |

V. Hokan-Siouan

- | | |
|------------------------------|------------------------|
| 1. Hokan-Coahuiltecan | (2) Coahuilteco |
| A. Hokan | (a) Coahuilteco proper |
| (1) Northern Hokan | (b) Cotoname |
| (a) Karok | (c) Comecrudo |
| (b) Chimariko | (3) Karankawa |
| (c) Shasta-Achomawl | |
| (b) Yana | 2. Yuki |
| (c) Pomo | 3. Keres |
| (2) Washo | 4. Tunican |
| (3) Esselen-Yuman | (1) Tunica-Atakapa |
| (a) Esselen | (2) Chitimacha |
| (b) Yuman | 5. Iroquois-Caddoan |
| (4) Salinan-Seri | (1) Iroquoian |
| (a) Salinan | (2) Caddoan |
| (b) Chumash | 6. Eastern group |
| (c) Seri | (1) Siouan-Yuchi |
| (5) Tequistlatecan (Chontal) | (a) Siouan |
| B. Subtiaba-Tlappanec | (b) Yuchi |
| C. Coahuiltecan | (2) Natchez-Muskogian |
| (1) Tonkawa | (a) Natchez |
| | (b) Muskogian |
| | (c) Timucua (?) |

VI. Aztec-Tanoan

- | | |
|----------------|-----------------|
| 1. Uto-Aztekan | 2. Tanoan-Kiowa |
| (1) Nahuatl | (1) Tanoan |
| (2) Piman | (2) Kiowa |
| (3) Shoshonean | 3. Zuni (?) |

entatives of four of the major culture areas of the continent: Plateau-Mackenzie area, southern outlier of West Coast area, Plains area and Southwestern area.

The aboriginal languages of North America differ from each other in both phonetic and morphological respects. Some are polysynthetic (or "holophrastic") in structure, such as Algonkian, Yana, Kwakiutl-Nootka, or Eskimo. Others, like Takelma and Yokuts, are of an inflective cast and may be compared, for structural outlines, to Latin or Greek; still others, like Coos, while inflective, have been reduced to the relatively analytic status of such a language as English; agglutinative languages of moderate complexity, comparable to Turkish, are common, say Shoshonean or Sahaptin.

The term "polysynthetic" indicates that the language is far more than ordinarily synthetic in form, that the word embodies many more or less concrete notions that would in most languages be indicated by the grouping of independent words in the sentence. The Yana word *yābanaumawildjigummaha'nigi* "let us, each one (of us), move indeed to the west across (the creek)!" is "polysynthetic" in structure. It consists of elements of three types—a nuclear element or "stem," *yā*—"several people move"; formal

elements of mode (-*ha*-, hortatory) and person (-*nigi* "we"); and elements of a modifying sort which cannot occur independently but which nevertheless express ideas that would ordinarily be rendered by independent words (-*banauma*- "everybody," -*wil*- "across," -*dji*- "to the west," -*gumma*- "indeed"). Such constructions are not uncommon in native America but are by no means universal.

Phonetically these languages differ enormously. Some, like Pawnee (Caddoan stock), have a simple consonantal structure, others make all manner of fine consonantal discriminations and possess many strange types of consonants, such as voiceless *l*-sounds, "glottalized" consonants, and velar *k*-sounds, that are infrequent elsewhere. Kutchin, an Athabaskan language of Alaska, possesses no less than 55 consonantal "phonemes," distinct consonantal elements of the total phonetic pattern. A considerable number of the native languages of North America are pitch languages, *i.e.*, they use pitch differences in otherwise similar syllables to make lexical or grammatical distinctions. Such languages are Tlingit, Athabaskan (certain dialects of this group have lost pitch as an inherently necessary element of language), Takelma, Shasta-Achomawi, Yuman, Tanoan. Navaho may serve as an example of such a pitch language. Every syllable in its words is definitely high or low in pitch, or, less frequently, has a falling or rising tone. Thus, *biní* means "his nostril" if the two syllables have a high tone, "his face" if they have a low tone, and "at his waist, centre" if the first syllable is low and the second high; *yāzid* means "you pour it (sandy mass) down" if the first syllable is low and the second high, but "I have poured it down" if both are low.

The six major linguistic groups of Sapir's scheme may be characterized as follows:

I. The *Eskimo-Aleut* languages are "polysynthetic" and inflective; use suffixes only, never prefixes, reduplication, inner stem modification, or compounding of independent stems; have a great elaboration of the formal aspect of verb structure, particularly as regards mode and person; and make a fundamental distinction between the transitive and intransitive verb, to which corresponds the nominal case distinction of agentive-genitive and absolutive (or objective).

II. The *Algonkin-Wakashan* languages, too, are "polysynthetic" and, especially as regards Algonkian, inflective; make use of suffixes, to a much less extent, particularly in Algonkian and Ritwan, of prefixes; have important inner stem modifications, including reduplication; have a weak development of case; and illustrate to a marked degree the process of building up noun and verb themes by suffixing to stems local, instrumental, adverbial, and concretely verbalizing elements.

III. The *Nadene* languages, probably the most specialized of all, are tone languages and, while presenting a superficially "polysynthetic" aspect, are built up, fundamentally, of monosyllabic elements of prevalently nominal significance which have fixed order with reference to each other and combine into morphologically loose "words"; emphasize voice and "aspect" rather than tense; make a fundamental distinction between active and static verb forms; make abundant use of postpositions after both nouns and verb forms; and compound nominal stems freely. The radical element of these languages is probably always nominal in force and the verb is typically a derivative of a nominal base, which need not be found as such.

IV. The *Penutian* languages are far less cumbersome in structure than the preceding three but are more tightly knit, presenting many analogies to the Indo-European languages; make use of suffixes of formal, rather than concrete, significance; show many types of inner stem change; and possess true nominal cases, for the most part. Chinook seems to have developed a secondary "polysynthetic" form on the basis of a broken down form of Penutian; while Tsimshian and Maidu have probably been considerably influenced by contact with Mosan and with Shoshonean and Hokan respectively.

V. The *Hokan-Siouan* languages are prevalently agglutinative; tend to use prefixes rather than suffixes for the more formal elements, particularly the pronominal elements of the verb; dis-

tinguish active and static verbs; and make free use of compounding of stems and of nominal incorporation.

VI. The *Astec-Tanoan* languages are moderately "polysynthetic"; suffix many elements of formal significance; make a sharp formal distinction between noun and verb; make free use of reduplication, compounding of stems and nominal incorporation; and possess many postpositions. Pronominal elements, in some cases nouns, have different forms for subject and object but the subject is not differentiated, as in types I. and IV., for intransitive and transitive constructions. (E. SA.)

Powell, "Indian Linguistic Families of America north of Mexico," Bureau of Ethnology, 7th Annual Report, pp. 1-142 (Washington, 1891); Franz Boas, "Handbook of American Indian Languages," Bureau of American Ethnology, Bull. 40 (pt. 1, 1911; pt. 2, 1922); P. Rivet, "Langues de l'Amérique du Nord," pp. 607-628 of A. Meillet et M. Cohen, *Les Langues du Monde* (Paris, 1924).

Mexican and Central American Languages.—The classification of the native languages of Middle America is not in quite so advanced a stage as is that of the many languages spoken north of Mexico. The languages are, some of them, spoken by large populations, numbering millions, as in the case of Nahuatl (or Mexican) and the Maya of Yucatan; others are confined to very small groups, like the Subtiaba-Tlappanec of Nicaragua and Guerrero, or are extinct, as is Waicuri in Lower California. Nahuatl, Maya (with Quiche, Kekchi, and Cakchiquel, which belong to the Mayan stock), and Zapotec were great culture languages which had developed ideographic methods of writing.

The languages of Middle America may be conveniently grouped into three main sets: A., southern outliers of stocks located chiefly north of Mexico; B., stocks spoken only in Mexico and Central America, so far as is known at present; C., northern outliers of South American stocks. It is quite probable that relationships will eventually be discovered between some of the languages of group B and languages lying further north.

To group A belong three distinct stocks: *Uto-Aztekan*, with two subdivisions, *Sonoran* (or *Piman*), spoken in a large number of dialects in northern Mexico, and *Nahuatl* (or *Aztek*), spoken in central Mexico and in a number of isolated southern enclaves—the Pacific coast of Oaxaca (Pochutla), three disconnected areas in Salvador and Guatemala (Pipil), two areas in Nicaragua and one in Costa Rica (Nicarao), and the Chiriqui region of Costa Rica (Sigua), of which dialects Nicarao and Sigua are now extinct—with *Cuiclateco* of Michoacan as a doubtful member of the stock; *Hokan-Coahuiltecan*, represented by *Hokan* proper, which includes Seri (coast of Sonora), Yuman (in Lower California), and Tequistlateco or Chontal (coast of Oaxaca), by *Coahuiltecan* (Pakawan), of the lower Rio Grande, and by *Subtiaba-Tlappanec*, which is spoken in two small areas in Guerrero, one in Salvador, and one in Nicaragua; and *Athabaskan* (Apache tribes of Chihuahua and Coahuila).

The Middle American languages proper (group B) may, with reservations, be classified into 15 linguistic stocks, which in alphabetic order, are: *Chinantec* (Oaxaca and western Vera Cruz); *Janambre* (Tamaulipas; extinct); *Jicaque* (northern Honduras); *Lenca* (Honduras and Salvador); *Mayan* (Yucatan and neighboring states of southern Mexico, British Honduras, western Honduras, and Guatemala), with an aberrant dialect group, *Huastec*, in the northeastern coast region of Mexico (Vera Cruz, San Luis Potosi, Tamaulipas); *Miskito-Sumo-Matagalpa*, consisting of three distinct language groups: *Miskito* (coast of Nicaragua and Honduras), *Sumo-Ulua* (eastern Nicaragua and southern Honduras), and *Matagalpa* (Nicaragua; a small enclave, Cacaopera, in Salvador); *Mixe-Zoque-Huave*, spoken in four disconnected groups, *Mixe-Zoque* (Oaxaca, Vera Cruz, Chiapas, and Tabasco), *Tapachultec* (southeastern Chiapas; extinct), *Aguacatec* (Guatemala, extinct), and *Huave* (coast of Oaxaca); *Mixtec-Zapotec*, a group of languages that some consider as composed of four independent stocks: *Mixtec* (Guerrero, Puebla, and western Oaxaca), *Amusgo* (Guerrero and Oaxaca); *Zapotec* (Oaxaca), and *Cuiclatec* (northern Oaxaca); *Olive* (Tamaulipas; extinct); *Otomian*, consisting of three distinct groups: *Otomí* (large part of central Mexico), *Mazatec* (Guerrero)

Puebla, Oaxaca; includes *Trique* and *Chocho*), and the geographically distant *Chiapanec-Mangue* (*Chiapanec* in Chiapas; *Mangue* and related languages in three disconnected areas in Nicaragua and Costa Rica); *Paya* (Honduras); *Tarascan* (Michoacan); *Totonac* (Hidalgo, Puebla, and coast of Vera Cruz); *Waicuri* (southern part of Lower California; extinct); *Xinca* (southeastern Guatemala).

The outliers from South America are two: *Carib* (coast of Honduras and British Honduras; transferred in post-Columbian times from the Antilles); *Chibchan* (Costa Rica and Panama). In the West Indies two South American stocks were represented, *Carib* and *Arawak*, the latter constituting an older stream which had overrun the Greater Antilles and penetrated into Florida.

As to the languages of group B, some connect Chinantec, Mixtec-Zapotec, and Otomian in one great linguistic stock, *Mixtec-Zapotec-Otomi*. Both Xinca and Lenca (also Paya and Jicaque?) may be remote southern outliers of the Penutian languages of North America. Waicuri may have been related to Yuman. It is by no means unlikely that such important Middle American stocks as Mayan, Totonac, and Tarascan may also belong to certain of the larger stock groupings that have been suggested for North America; e.g., Maya may fit into the Hokan-Siouan framework, Tarascan into Aztek-Tanoan.

Middle America, in spite of its special cultural position, is distinctly a part of the whole North American linguistic complex and is connected with North America by innumerable threads. On the other hand, there seems to be a much sharper line of linguistic division, distributionally speaking, between Middle and South America. This line is approximately at the boundary between Nicaragua and Costa Rica; allowances being made for Nahuatl and Otomian enclaves in Costa Rica and for an Arawak colony in Florida, we may say that Costa Rica, Panama, and the West Indies belong linguistically to South America. The Chibchan, Arawak, and Carib stocks of the southern continent were obviously diffusing northward at the time of the Conquest, but evidence seems to indicate that for Mexico and Central America as a whole the ethnic and linguistic movement was from north to south. Middle America may be looked upon as a great pocket for the reception of a number of distinct southward-moving peoples and the linguistic evidence is sure to throw much light in the future on the ethnic and culture streams which traversed these regions.

Two linguistic groups seem to stand out as archaically Middle American: Miskito-Sumo-Matagalpa, in Central America, and Mixtec-Zapotec-Otomi, with its center of gravity in southern Mexico. The latter of these sent offshoots that reached as far south as Costa Rica. The Penutian languages, centered in Oregon and California, must early have extended far to the south, as they seem to be represented in Mexico and Central America by Mixe-Zoque, Huave, Xinca, and Lenca. These southern offshoots are now cut from their northern cognate languages by a vast number of intrusive languages, e.g., Hokan and Aztek-Tanoan. The Mayan languages, apparently of Hokan-Siouan type, may have drifted south at about an equally early date. Presumably later than the Penutian and Mayan movements into Middle America is the Hokan-Coahuiltecan stream, represented by at least three distinct groups—Coahuiltecan (N.E. Mexico), Subtiaba-Tlapanec (Guerrero, Nicaragua), and a relatively late stream of Hokan languages proper (Yuman; Seri; and Chontal in Oaxaca). Not too early must have been the Uto-Aztekan movement to the south, consisting of an advance guard of Nahuatl-speaking tribes, a rear guard of Sonoran-speaking tribes (Cora, Huichol, Tarahumare, Tepehuane). The Nahuatl language eventually pushed south as far as Costa Rica. Last of all, the Apache dialects of Chihuahua brought into Mexico the southernmost outpost of the Nadene group of languages, which extend north nearly to the Arctic. (E. S.A.)

CENTRAL BANK. By a central bank is meant an institution upon which has been conferred, by law or custom, the responsibility for the smooth running of the credit and currency system of a particular area. Since this task means in practice that all the other banks and organizations in the money market in question must be able to turn to it for assistance in critical times, such a bank becomes "central" both in the figurative sense that it is the final source of aid, and in the literal sense that the working of the money market is intimately and constantly affected by the manner in which the central bank, holding the ultimate cash reserve and possessed of the right of note-issue, interprets its responsibilities, that is, by the "central bank policy" it actively pursues.

The period of reconstruction since the World War has witnessed a remarkable growth in the number of separate institutions acting as Central Banks, as well as important alterations in the powers and practices of certain banks already in existence in pre-war days. The movement in this respect is indeed world-wide. Taking first the British dominions, the South African Reserve Bank was set up in 1920, and the Commonwealth Bank of Australia was re-organized in 1924; the Presidency Banks of India were amalgamated in 1920, and the 1926 Commission on Indian Currency and Finance proposed a Reserve Bank for India, the constitution of which is still in dispute. In Canada rediscount facilities, though not a central bank, were provided under war emergency legislation and have now been made permanent. In South America new banks have been created in Peru (1922), Guatemala and Chile (1925), and a new bank was founded in Mexico (1925). In Europe, new banks were founded or alterations were made in the existing banks in Russia (1921), Lithuania, Latvia and Austria (1922), Danzig (1923), Germany, Poland and Hungary (1924), Czechoslovakia and Albania (1925), Belgium and Italy (1926).

The movement is only in part to be explained by the territorial changes which have followed the war, and the currency difficulties which were caused by it. These factors explain why, when devaluation and stabilization of the standard were decided upon, the reserve requirements were altered; they do not explain why the movement has acquired such momentum in the newer countries, which in pre-war days were content to enjoy the facilities for rediscount offered by the older money markets—in particular the facilities of the London money market.

Central Cash Reserve.—The fundamental factor is the recognition that a central bank is a prime requisite for the adequate functioning of the banking and currency system of a given country. First, the absence of a central bank involves decentralized cash reserves, and experience shows that decentralization of reserves is expensive and ineffective, because in the absence of co-operation each bank requires to hold more, and the larger amount it holds is not available except for its own needs, so that the strong cannot help the weak, whilst the failure of the weaker banks imperils the position of the others. Secondly, it becomes possible to replenish reserves by rediscounting at the central bank, so that the lock-up of funds in holding cash reserves is still further reduced. Thirdly, since a domestic drain on cash reserves represents a demand for legal tender rather than for gold, the percentage cash reserves which the central bank need itself hold is still further reduced, the cash reserve of the central bank being determined with reference to foreign, rather than to domestic demands for gold. Fourthly, since demands for cash are concentrated at a single point, and are associated in the variations in the volume of loans demanded from the central bank, the ebb and flow of currency and credit are under constant supervision by a single authority, so that remedial measures can be applied more rapidly and more effectively. Fifthly, the central bank acts as a centre of information, control and censorship, so that the self-interest of the parts can be checked by the more disinterested action of the central monetary authority, whilst in periods of crisis there is a technical and moral authority ready to assume responsibility. Sixthly, from the standpoint of the international monetary situation, the initiation of a common policy becomes much easier if there are centres through which appropriate action can be undertaken.

Control of Price.—In the opinion of many authorities, the most important problem awaiting solution in the field of applied economics is the control of the price level. Two somewhat dissimilar issues are involved here: the elimination of short-period or cyclical fluctuations in the value of money, and the elimination of changes in the long-period price level. It is argued that the machinery by which the central bank maintains the local currency at a fixed value in terms of a single commodity; *i.e.* gold, is also available for keeping the value of the local currency constant in terms of a group of commodities. Thus the extension of function involved in the elimination of price changes involves questions not of kind, but only of degree; the technique only requires to be applied to a new end.

If this is admitted the degree of success attained must still turn on the efficacy of the technical means available. Experience has shown that the practical working of central banks is not so capable of assimilation to general rules as was formerly thought, for in pre-war days central banks were confined to a smaller number of countries which had the same general economic characteristics. In the newer countries one fundamental condition usually present in the older areas is largely absent: a highly developed use of bills of exchange. This fact, combined with a reluctance on the part of commercial banks to make use of the credit facilities available, deprives the central bank of its power to influence market rates of interest by means of variations in discount rates, and has forced to the front the complementary method of exerting influence—the so-called open market policy, by which variations in the volume of securities held by the central bank are made to play the part formerly held by variations in the volume of bills discounted. Even in the older areas “rationing” of credit has been of late years often preferred to raising the discount rate in the attempt to control borrowing. Moreover, in the newer countries the general relations between the central bank and the other banks in the money market have not yet been satisfactorily adjusted. If the central banks are to carry out their functions adequately, they must control at all times a certain amount of the business of the money market. Yet, if they do so, their actions may easily be interpreted in an unfriendly spirit, and they may be accused of extending beyond their “natural” sphere. Again, it may be open to doubt whether all of these banks can command the necessary experience and trained personnel, whether their relations with the State are always healthy, and, finally, whether the area over which their control extends is always sufficiently large and self-contained to warrant the setting-up of elaborate machinery.

International Credit Co-operation.—The increase in the number of central banks is also likely to complicate the task of international co-operation between them. As pre-vised by the Genoa Conference, co-operation was to take the form of conferences, whilst the end desired was co-ordination of reserve policy with a view to avoiding a “scramble for gold” and abrupt changes in its value. So far no conference has met; instead there has developed an informal co-operation between the governors of the Banks of England and France, the New York Reserve Bank and the Reichsbank. This has not escaped criticism, especially in the United States; but the difficulty of arriving at a common policy would obviously be still greater if the number of participants were largely increased and the negotiations were publicly conducted. Apart from the informal co-operation alluded to, the Bank of England has in late years played an important, though largely unrecorded, rôle as censor and guide to the central banks of those European countries whose currencies were emerging from the post-war chaos.

From the technical standpoint, central bank structure has in recent years been powerfully influenced by the Federal Reserve System. This has been particularly the case in South America. The characteristic features most frequently drawn on are compulsory stock-ownership and compulsory holding of deposits at the central bank by the commercial banks of the country. The principle of forcing the central bank to hold specific reserves against its deposits is also taken from Reserve Bank practice; it has been adopted; *e.g.*, in Peru, Germany, and South Africa. But modern central bank practice as a whole rests upon three main

ideas: economy in gold reserves, elasticity of note issue, and, in the fixing of reserve proportion, the assimilation of note issues and deposits; *i.e.* the reserve is maintained against the *sum* of the notes and deposits. Safeguards are provided in the limitation of the amount of reserves other than gold which may be kept, and in the provision that excess issues of notes shall be taxable; whilst the amount of the tax must be added to the discount rate, so as to discourage borrowing at such a time. At present one of the features of the balance sheet of many central banks is the high proportion of Government debt to the total interest-bearing assets of the bank. This circumstance is due to inflationary war-finance, by which the note issues of the banks increased, increased Government indebtedness being held as an asset against them. Fear of the repetition of such practices has led in some cases to a very strict limitation of the right of the Government to borrow from the bank in future (*e.g.* in Germany, Austria, Hungary, Czechoslovakia). On the other hand, the stabilization of currency at low gold values (devaluation) has had the effect of greatly improving the reserve ratio in certain cases by revaluation at the new stabilization rate, and thus obviating pressure on the free gold reserves of the world. (*See BANKING AND CREDIT; MONEY; BANK OF ENGLAND; BANQUE DE FRANCE; BANCA D'ITALIA; REICHSBANK.*) (T. E. G.)

CENTRAL ELECTRICITY BOARD. In 1925 a committee, under Lord Weir, was appointed by the British Government to review the national problem of the supply of electrical energy and to report on future policy. Subsequently a bill, framed on the main lines of the committee's recommendations, was passed into law as the Electricity (Supply) Act, 1926. The Central Board was constituted under that Act. It is a body corporate, and consists of eight members, appointed by the Minister of Transport. Briefly stated, its functions are to organize and control the generation of electricity throughout the whole of Great Britain. With that object in view, schemes are to be prepared by the electricity commissioners under the Act and transmitted to the Board for adoption, after any modifications found to be expedient as a result of representations by interested parties.

The intention is ultimately to link up electrically the whole of Great Britain, following which the generation of electricity, now effected at a multiplicity of comparatively small stations, will be at a limited number of “selected” stations, each of large capacity and favourably situated for economical production. Such stations will usually be operated by their owners on behalf of the Board and in accordance with the Board's directions. They will be interconnected with one another and with points of supply by high-tension transmission lines erected or acquired and maintained by the Board, who will thus control the whole of the generation in bulk, as well as its transmission to the local systems of supply to individual consumers. To render this uniformly possible it is contemplated that the various frequencies of supply existing at the passing of the Act will be standardised to a frequency of 50 cycles per second.

It will thus be seen that the Board's main task is to cheapen production as well as to make electrical energy more generally accessible. The investigations of the committee referred to had shown that although Great Britain is favourably placed as a potential producer and distributor of cheap electrical energy, the rate of consumption per head of the population was below that of other leading nations. For the purpose of providing working capital, and for constructing and acquiring transmission lines and permanent works generally, the Board has power to issue stock up to a maximum of £33,500,000, or, by special order, in excess of that amount. The Board commenced to function in March, 1927. On July 1, 1927, the first scheme was adopted, embracing an area covering about 4,980 square miles in central Scotland. A second scheme, embracing the south-east area of England, and covering about 8,828 square miles, was adopted in Feb. 1928. The Board's first chairman was Sir Andrew R. Duncan. (*See ELECTRICAL POWER TRANSMISSION.*)

CENTRAL FALLS, a city of Providence county, Rhode Island, U.S.A., on the Blackstone river, 5m. N. of Providence; served by the New York, New Haven and Hartford railroad. The

population in 1920 was 24,174 of whom 9,456 were foreign-born white; in 1930 it was 25,898. The river furnishes water-power for large manufacturing industries (chiefly cotton-mills), which in 1925 had an output valued at \$25,541,848. A settlement was made here about 1763. About 1780 a chocolate-mill was erected, and until 1827 the town was called Chocolateville. It was incorporated as the Central Falls Fire District of Smithfield in 1847, and in 1896 was chartered as a city.

CENTRALIA, a city of southern Illinois, U.S.A., about 60m. E. of Saint Louis, in Marion and Clinton counties. It is on Federal highway 51, and is served by the Burlington, the Illinois Central and the Missouri-Illinois railways. The population was 12,491 in 1920, and was 12,583 in 1930 by the Federal census. It is in a fertile fruit-growing and dairying region, and there are coal-mines and oil and gas wells in the vicinity. The city has a large wholesale trade. Two of the railroads have division repair shops here, and there are several other manufacturing industries. Centralia was founded in 1853 by the Illinois Central railroad company, and was chartered as a city in 1859.

CENTRALIA, a city of Lewis county, Washington, U.S.A., on the Pacific highway, about half-way between Seattle and Portland. It is served by four transcontinental railways: the Chicago, Milwaukee, St. Paul and Pacific, the Great Northern, the Northern Pacific and the Union Pacific. The population was 7,549 in 1920, and was 8,058 in 1930 by the Federal census. Chehalis, the county seat, lies 4m. S., and between the two cities are the south-western Washington fair-grounds. Lumbering, coal-mining, dairying, poultry-raising and berry-growing are the principal occupations of the region. Centralia has saw and shingle mills, furniture and concrete culvert factories and railroad shops. In Borst park, 1½m. W. of the city, is a blockhouse built by the early settlers as a stronghold against the Indians. Centralia is situated on the Cochrain Donation Claim. It was laid out by George Washington, a negro ex-slave of Cochrain, who became the owner of the land on the death of his master in 1852, and at first it was called Washington's Addition. Later it was known for a few years as Skookumchuck station, and then as Centerville, until the present name was adopted in 1887. In 1914 a commission form of government was adopted. On Armistice Day, 1919, Centralia was the scene of a conflict between the American Legion and the Independent Workers of the World which resulted in several deaths.

CENTRAL INDIA, a collection of Indian states forming a separate agency, which must not be confounded with the Central Provinces. The Central India agency was formed in 1854 and consists of two large detached tracts of country which, with Jhansi as a pivot, spread outwards east and west into the peninsula, reaching southward to the valley of the Nerbudda and the Vindhya and Satpura ranges. The total area, since Gwalior was removed from the agency, is 51,531 square miles.

Central India (including for the moment Gwalior) may be divided into three great natural divisions; the highlands of the Malwa plateau, with a mean elevation of some 1,500 ft. above sea-level; the low-lying country some 600 ft. above sea-level, comprising the greater part of the eastern section of the agency; and the hilly tracts which lie mostly to the south. The Malwa plateau consists of great undulating plains, separated by flat-topped hills, whose sides are boldly terraced, with here and there a scarp rising above the general level. Its foundation is a bed of sandstone and shales belonging to the Vindhyan series, which underlies the whole of the agency except the northern part of Bundelkhand. On the plateau itself the sandstone is generally overlaid by the Deccan trap, a blackish-coloured basaltic rock of volcanic origin, the high level tableland having been formed by a succession of lava flows, the valleys of Central India being merely "denudation hollows" carved out by the action of rain and rivers. It is apparently the northern limit of what was once a vast basaltic plain stretching from Goona to Belgaum, "one of the most gigantic outpourings of volcanic matter in the world." The sandstone bed on which it rests is visible at a point just north of Goona, and in a small area round Bhilsa and Bhopal. The low-lying land includes roughly that part of the agency which lies to the east of the plateau and comprises the greater part of the political divisions of Bundel-

khand and Baghelkhand and the country round Gwalior. The formation is sandstone of the Vindhyan series, except in the north of Bundelkhand where the prevailing rock is gneiss and quartz. The quartz takes the shape of long serrated ridges, trap appearing here and there in intrusive dykes. The hilly tracts lie chiefly to the south of the agency, where the Vindhya, Satpura and Kaimur ranges are met with. The country is rough forest and jungle land little used for cultivation. The greater part of Central India is covered with the well-known "black cotton soil," produced by the disintegration of the trap rock. It is a very rich loamy earth, possessing great fertility and an unusual power of retaining moisture, which makes artificial irrigation little needed. The ordinary "red soil" covers a large part of northern Bundelkhand, and as it requires much irrigation, tanks are a special feature in this country.

Administrative Divisions.—The Central India agency is divided for administrative purposes into the residency of Indore, and the agencies of Baghelkhand, Bhopal, Bhopawar, Bundelkhand, Indore and Malwa. Gwalior was removed from the agency in 1921 and put directly under the Governor-General. Besides Indore there are 13 states of importance, viz., Rewa, Bhopal, Dhar, Barwani, Datia, Orchha, Charkhari, Chhattarpur, Panna, Dewas (senior branch), Dewas (junior branch), Jaora and Ratlam. At the close of the Pindari War in 1818 the whole of this country was in great confusion and disorder, having suffered heavily from the extortions of the Mahratta armies and from predatory bands. It had been the policy of the great Mahratta chiefs, Holkar and Sindhia, to trample down into complete subjection all the petty Rajput princes. Many of these minor chiefs had taken refuge in the hills and forests, and retaliated upon the Mahratta usurpers by wasting the lands which they had lost, until the Mahrattas compounded for peace by payment of blackmail. In this state of affairs all parties agreed to accept the interposition of the British government for the restoration of order, and under Lord Hastings the work of pacification was effected. The policy pursued was to declare the permanency of the rights existing at the time of the British interposition, conditionally upon the maintenance of order; to adjust and guarantee the relations of subordinate and tributary chiefs to their superiors so as to prevent all further disputes or encroachments; and to settle the claims of the ousted landholders, who had resorted to pillage or blackmail, by fixing grants of land or settling money allowances. The resultant states have no general ethnological affinity, such as exists in Rajputana. Their territories are in many cases neither compact nor continuous, consisting of a number of villages here and there, with a nucleus of more or less importance round the chief town. Their relations to the government of India and to each other present many variations. Ten of them are under direct treaty with the government of India; others are held under *sanads* and deeds of fealty and obedience; while a third class, known as the mediatised states, are held under agreements mediated by the British government between them and their superior chiefs.

Population.—The total population of the Central India agency in 1921 was 5,997,023, Hindus largely predominating; but a few Mohammedan groups still exist, either traces of the days when the Mogul emperors extended their sway from the Punjab to the Deccan, or else the descendants of those northern adventurers who hired out their services to the great Mahratta generals. Of the first Bhopal is the only example, while Jaora is the only notable instance of the other. Roughly there are four great sections of the population; the Mahratta section, who belong to the ruling circles; the Rajputs; the trading classes, consisting chiefly of Marwaris and Gujaratis; and lastly, the jungle tribes. The Mahrattas are foreigners, and, though rulers of the greater part of Central India, have no true connection with the soil and are little met with outside cities, the vicinity of courts, and administrative centres. The Rajputs with all their endless ramifications form a large portion of the population. On the Malwa plateau they are pure-blooded aristocrats: on the low country they have got their blood more mixed, and the plateau families as a rule will not intermarry with them. The Marwaris hold practically all the trade of Central India, with the exception of the Bora class of Mohammedans.

They are either Vaishnavite Hindus or else Jains. Their advent into Central India dates, except in the case of one or two families, from the time of the Mahratta invasion only. The Jain portion of this community is very wealthy. The last section, that of the jungle tribes, is semi-civilized and shy, little affected as yet by the Hinduism of the conquerors.

The British agent to the governor-general resides at Indore, and there are British cantonments at Mhow, Neemuch and Nowgong.

CENTRAL PROVINCES AND BERAR. The Central Provinces of India were formed in 1862, and were augmented in 1903 by the Hyderabad assigned districts of Berar, which are leased in perpetuity to the British Government by the Nizam, at an annual rent of 25 lacs of rupees. In 1905 most of the Sambalpur district and five Uriya-speaking States were transferred to Bengal, and five Hindi-speaking States from Chota Nagpur received in exchange. The Province, therefore, now consists of the five divisions of Jubbulpore, Nerbudda, Nagpur, Chhattisgarh and Berar, which are divided into the 22 districts of Saugor, Damoh, Jubbulpore, Mandla, Seoni, Narsinghpur, Hoshangabad, Nimar, Betul, Chhindwara, Wardha, Nagpur, Chanda, Bhandara, Balaghat, Raipur, Bilaspur, Drug, Amraoti, Akola, Buldana and Yeotmal, and the 15 feudatory States of Makrai, Bastar, Kanker, Nandgaon, Khairagarh, Chhuikhadan, Kawardha, Sakti, Raigarh, Sarangarh, Chang Bhakar, Korea, Sirguja, Udaipur and Jashpur. There are two districts, Saugor and Damoh, on the Vindhyan plateau; south of these are the Nerbudda valley districts extending from Jubbulpore on the east to North Nimar on the west. South of these again is the great Satpura range of hills and plateaus upon which are situated the four plateau districts of Betul, Chhindwara, Seoni and Mandla and the uplands of Balaghat. South of the Satpuras are the three great plains of Berar, Nagpur and Chhattisgarh, all bounded by hills on the south, Chhattisgarh being divided from the rest of the Province by the Maikal range. The Province is practically surrounded by States, and at only three points does the boundary touch British territory proper, viz., the Jhansi and Mirzapur districts of the United Provinces, in the north of Saugor, and north of the Sirguja State respectively Khandesh of the Bombay Presidency in South Nimar, and West Berar and the Madras Zamindari Estates on the extreme south-east of Raipur and Bastar. Otherwise the Province is hemmed in by the Central India States on the north, Nizam's territory on the south, and the Orissa feudatory States on the east. Only the two Vindhyan districts drain into the Gangetic plain. The waters of the rest of the northern districts and West Berar are carried by the Nerbudda and the Tapti, fed by their many tributaries rising in the Satpuras, into the Arabian sea. South Berar and the Nagpur division drain south-westwards into the Godavari, the principal rivers being the Waingunga, the Wardha, the Paingunga and their numerous tributaries. The eastern and south-eastern portion, Chhattisgarh, is drained by the Mahanadi to the Bay of Bengal. Except for short reaches none of these rivers is navigable throughout the year.

Climate.—In climate the Vindhyan and Satpura districts are comparatively temperate; the Nerbudda valley is hot, and the three great plains south of the Satpuras have the temperature of the Deccan, the heat from March to the middle of June being excessive, but very dry. The three northern tracts enjoy a very pleasant cold season; in the three southern the cold is limited to occasional snaps, and the season is cool rather than cold. But, except in the extreme south of Chanda and the tracts nearest Bengal, where the "rains" produce an exceedingly steamy atmosphere, the Province has the advantage of a reasonably cool, rainy season, since both the cyclonic storms from the Bay of Bengal and the steady current of the south-west monsoon from the Arabian sea bring it moisture-laden clouds. The rainfall varies from 25 in. to 30 in. in the west, and from 50 in. to 60 in. in the east. The monsoon period is divided between early rains, often deficient, middle rains, seldom failing completely, and late rains, premature cessation of which frequently causes severe losses. In 1896 the late rains failed completely, and in 1899 all three periods were failures. These caused the most extensive

famines in the history of the Province since it came under British rule.

Agriculture.—A line drawn from Katni in the north to Chanda in the south roughly divides the agriculture of the country. East of that line the principal crop is rice, and the rainfall is heavy. West of it, there are two sections—the northern in which wheat, gram and cold-weather crops are the most important; the southern in which cotton and juar (big millet) are the great staples. The Nerbudda valley and the Vindhyan districts are the great wheat-producing areas; Nimar, Berar and Nagpur (West), mainly composed of Deccan trap, are the great cotton and juar tracts, but while cotton and juar are quite insignificant in the rice country, and rice is insignificant west of the line of division described, practically every district in the Province contains some heavy black soil areas which produce wheat and cold-weather crops. This variety of soil and cropping affords a certain degree of insurance against capricious rainfall. There are about five million acres of rice, three-and-a-half million acres of wheat, two-and-a-half million acres of juar and one-and-a-quarter million acres of cotton. Besides these, there are large areas under oil seeds, linseed, sesamum and niger being the most important. There are pulses and peas of many kinds, and in the hills and light soils, small millet (Kodon and Kutki), the staple food of the aboriginal tribes.

In Berar the system of land revenue settlement is the Ryotwara system, on the Bombay model. In the Central Provinces proper the proprietary system of Agra prevails, but the Central Provinces tenant enjoys by law and tradition a degree of protection greater than in any proprietary province, and with this security against arbitrary ejectment and arbitrary enhancement of rent, he has thriven wonderfully, in spite of fluctuations due to bad seasons and the debts which these bring in their train. Much has been accomplished by the creation and expansion of the Agricultural Department from small beginnings to a well-regulated service with experimental seed and demonstration farms, model cattle farms, scientific research and education to improve the yields and better the lot of the cultivator, while co-operative banks and societies have spread all over the country, affording cheaper credit than the moneylender will offer.

In the rice districts there are numerous irrigation works made by the people themselves, though few of these can stand against protracted drought. Government irrigation works only began to be undertaken 25 years ago, and in that time three large canals and many large and small storage works have been constructed, mainly in the rice districts. These now protect half a million acres from the effects of drought. There are still several large projects under construction and investigation, principally in the Bilaspur district, which had been somewhat neglected in this respect. There are about 20,000 sq. miles of Government forest reserves, and about 9,000 sq. miles of private forests; to which must be added 15,000 sq. miles in the feudatory States. There are valuable sal (*Shorea robusta*) forests in the north-east, and teak (*Tektona grandis*) in almost every district, though teak of fine girth is limited to a few famous reserves. There are many miscellaneous kinds of timber, bamboos and minor produce of commercial value, while there are edible fruits and roots with which the forest tribes supplement their food supply. The mohua tree (*Bassia latifolia*) has a flower which is edible, and from which country liquor is distilled, as well as a nut from which oil is extracted. The Government forests yield an annual revenue of some 50 lacs of rupees.

Population.—Nearly one-fifth of the people are of aboriginal and old Dravidian races, Gonds being the most numerous. Nearly all the rest are immigrants, mostly Hindus, who entered, some in very ancient days, others intermittently (notably when the Moguls conquered the Deccan and exercised suzerainty over the Gond chiefs). Many of these came from Malwa, some from Hindustan, but with the entry of the Mahrattas on the scene 200 years ago, a large influx of Mahrathi-speaking people poured in from the west. On the fringes along the east and south there are Oriya and Telugu immigrants. Mohammedans numbering only 3½% of the population are to be found mainly in the towns,

being descendants of settlers who clustered round Mogul posts and certain seats of Government, or such special cities as Burhanpur and Ellichpur. Individual Mohammedan families occupied land in the interior, but while only 9% of the total population is urban, 41% of the Mohammedans live in the towns.

With such heterogeneous elements and origins, there are great diversities of language. There are ten major languages, with many separate dialects of the same. There are 200,000 people returned as speaking many minor languages. In round numbers there are nine millions who speak various dialects of Hindi, and five millions who speak Mahrathi of various degrees of purity, the remaining two millions being divided up among tribal and other minor languages.

The first regular census was taken in the Central Provinces in 1872, in Berar a few years earlier. The figures of that census may be taken as representing the high-water mark of development before railways entered the Province. The last census is of 1921. The contrast is notable:—

| | Population 1872 | Population 1921 |
|------------------------------|--------------------|--------------------|
| C.P.—British districts . . . | 7,723,535 | 10,837,444 |
| Berar | 2,227,654 | 3,075,316 |
| Feudatory States | 928,195 | 2,066,900 |
| Totals | 10,897,384 | 15,977,660 |

This increase is shown in spite of a decrease during the decade 1891–1901, due to the great famines and the first ravages of plague, and virtual stagnation in the decade 1911–1921, which included the World War, two serious crop failures, and the great influenza scourge of 1918–1919, which claimed 1½ million victims.

Railways.—Before the railways came there was a burst of activity in the construction of some important trunk roads, some of which were allowed to fall into disrepair when the trunk lines of railway were made. A branch of the East Indian Railway from Allahabad to Jubbulpore was the first railway made in the Province in 1870, while the G.I.P., bifurcating at Bhusawal, in Khandesh, sent one line to meet the East Indian at Jubbulpore, and a second branch through Berar to Nagpur. It was 20 years before the Bengal-Nagpur railway, absorbing a State meter gauge line from Nagpur to the borders of Chhattisgarh (opened in 1881) made a second connection between Bombay and Calcutta via Nagpur and Bilaspur, from which place a branch went over the Ghats and across the Rawa State to join the East Indian at Katni. The Indian Midland Railway, afterwards amalgamated with the G.I.P., made a fresh connection from Itarsi in Hoshangabad, via Bhopal, Gwalior and Jhansi, with Agra and Delhi, and a branch from Bina, through Saugor and Damoh, connecting with Katni followed a few years later. Ten years later saw the next development by the Bengal-Nagpur Railway of narrow gauge lines (2 ft. 6 in.) across the Satpura from Gondia in Bhandara to Jubbulpore, with branches to Seoni, Chhindwara and Mandla on the Satpura plateau. This was followed by a line from Gondia south-westwards to Chanda, where it met an extension of the Warora Coal Railway to the new coal-field at Ballaspur, a few miles south of Chanda. Connections on the same narrow gauge with this branch to Nagpur and on to Chhindwara followed. A further broad gauge connection between Nagpur and Itarsi was completed in 1926, crossing the Satpura district of Betul with a branch into the Chhindwara coal-field.

Two links, both under construction, alone remain to complete direct broad gauge connections between Southern India and the North, one from Warangal to Chanda, and the other from Vizianagram on the east coast to Raipur. One more link on the meter gauge is required to join the Hyderabad-Godavari Railway at Hingoli with the Rajputana-Mulwa Railway at Khandwa, via Basim and Akola. When this, too, is accomplished, the network of railways in the C.P. and Berar will be completed, representing a length of 3,000 miles inside the Province. There are also feeder lines in the cotton country of Berar and Wardha, controlled by private companies. All these works represent an outlay of at least £25,000,000 and only a few feeder lines remain to be con-

structed. There are also 8,000 miles of roads, half being metalled and half gravelled, but with the great increase of motor traffic which is now beginning to penetrate even the remoter areas, there is still an enormous scope for road construction before village cart tracks cease to be the main method of wheel traffic.

Trade and Commerce.—The trade of the country has enormously increased, the value of the rail-borne traffic being about 60 crores of rupees annually. The bulk of the exports are cotton, wheat, rice, oil seeds and other agricultural produce, but coal and manganese are now important items. Coal is unfortunately of too poor a quality to be of any use for metallurgical purposes. There are coal-fields in Narsinghpur, Chanda and Wun (Berar), and in the Pench valley in Chhindwara (*q.v.*). It is used in cotton mills and factories and to some extent on the railways. The manganese deposits in Nagpur, Bhandara, Balaghat and Chhindwara are being vigorously worked, and some 500,000 tons a year are exported. There are plentiful bauxite deposits in Jubbulpore and Balaghat awaiting exploitation. Iron ore is found in many districts, but worked only by indigenous methods in small charcoal furnaces. There are large deposits of excellent ore in Chanda, but for want of coking coal it is practically untouched. There is also valuable limestone in many places, notably near Katni, where lime and cement works are important industries.

Outside the cotton industry (which is represented by 12 spinning and weaving mills and some 300 textile and connected factories, including ginning factories, employing in all about 60,000 people), the gun-carriage factory in Jubbulpore and the Government and railway workshops, organized manufacturing industries are confined mostly to small concerns scattered about in various districts, but the motor trade and electrical installations are increasing. Rural and small hand industries include hand weaving, the manufacture of brass and copper utensils, pottery, shoes, baskets, bamboo matting, carpentry and smithy work, but the larger colonies of handicraftsmen have suffered from the competition of machine-made goods, both local and imported. In the mass, however, cottage and hand industries still have a large output. They depend on agricultural prosperity and suffer with agriculture from the effects of bad seasons.

The Province has also made strides educationally. Colleges and high schools and subsidiary institutions have multiplied in numbers, and there is now a university at Nagpur, with institutions for scientific and professional training, which have increased both in numbers and status. In the 40 years between 1881 and 1921 literacy among males increased from 51 to 103 per mille, and among females from 1 to 8 per mille. Literacy in English is confined to a few castes. 84 per 10,000, or under 1%, of males can read English, but only 9 per 10,000 females, or under 1 per thousand. Great efforts have been made to extend medical relief in hospitals and dispensaries, better knowledge of hygiene and child welfare. The public revenue reflects the general advancement. Twenty years ago it was under two crores of rupees; it is now over six.

HISTORY

These two territories, now under a single administration, have a somewhat different history. The history of Berar is mainly the history of the Deccan, to which it geographically belongs. The Central Provinces were known to the races of the north as the "Forests of the South," inhabited by Rakshas or demons, but ancient Rajput dynasties penetrated to the more open parts of the country, and of these the famous Hai Hai Bansi dynasty ruled Chhattisgarh for many centuries until conquered by the Bhonslas in 1741.

The Gonds.—The rest of the Central Provinces were known as Gondwana, the kingdom of the Gonds, who held the wildest parts of the country. The oldest Gond kingdom was that of Chanda in the south, to which a history of about 800 years is sometimes attributed. In the north was the kingdom of Garha-Mandla, from which sprang the two sub-kingdoms of Deogarh in Chhindwara and Kherla in Betul. This last was overthrown by Hoshang Shah of Malwa, the founder of Hoshangabad. The Gond

kings, who must have established their rule over older Rajput dynasties, are fond of describing themselves as Rajgonds, and of claiming a Rajput origin.

One of these Gond kings, said to have been the 47th of the Garha-Mandla house, named Sangramsha, in 1480 extended his dominion over the Nerbudda valley and the Vindhyan districts, including even the tract now known as the State of Bhopal. Sangramsha lived until 1530, but a successor of his, Chandrasha, was forced to cede the two last-named territories to the Moguls in 1570, but, though these Garha-Mandla chiefs owed a nominal allegiance to the Mogul emperor, they maintained a virtual independence until the weakening of the Mogul power let in the predatory forces of the Mahrattas and (in the north) the Bundela chiefs. The Garha-Mandla Raj was finally overthrown by the Peshwa in 1780.

The Gond Rajah of Deogarh had paid a visit of homage to Delhi, and was so impressed with what he saw there, that he turned Mohammedan, adopting the name of Bakht Buland and establishing a new capital at Nagpur. He was himself an enlightened chief, but one of his grandsons, quarrelling over the succession, invited Raghoji Bhonsla from Berar to help him against his brother.

The Mahrattas.—Raghoji and his Mahrattas accomplished this mission, and returned to their own territory, but later he established himself at Nagpur. Raghoji I., sprung from a peasant family in Satara, was a great leader, and by 1751 had conquered the territories of Nagpur, Chanda and Chhattisgarh. He defied the Peshwa, burnt Poona on the west, and on the east raided Bengal, and extended his sovereignty over Orissa. He died in 1755 and his son Janoji was forced to submit to the Peshwa, but the next rajah, Mudhoji, and, after him, Raghoji II., acquired by purchase the northern territories as well, and the Nagpur State thereafter comprised the whole of the Central Provinces, Orissa, and some of the Chota Nagpur States. By joining Sindia against the British in 1803, and as the result of Wellesley's victories of Assaye and Argaon, Raghoji lost Cuttack, Sambalpur and part of Berar. His successor, Mudhoji (known as Appa Sahib), by a treacherous attack on the British in 1818, was forced to cede the whole of the northern districts. Appa Sahib was allowed to hold the Nagpur territory, but on his further treachery being discovered, he fled, and a minor grandson of Raghoji II. was recognized as rajah by the British government. During his minority the Nagpur territories were administered by the Resident, Sir R. Jenkins, until 1840. Raghoji III. died in 1853, without male issue, and Lord Dalhousie declared the Nagpur State an escheat.

Central Provinces Under British Rule.—The northern territories ceded in 1818 and known as the Sangor Nerbudda territories were administered as part of the Province of Agra. When the Nagpur territories escheated in 1853, they were administered by a commissioner as the Nagpur province. In 1861 they were amalgamated with the northern territories and became the Central Provinces. In 1903, Berar was added to the charge of the chief commissioner. In 1905, on the partition of Bengal, the Sambalpur district and the Uriya States adjacent to it were transferred to Bengal in exchange for five Hindi-speaking States of Chota Nagpur.

The first chief commissioner was the energetic Sir Richard Temple. His successor, Sir John Morris, governed the province for over 15 years, after which came a rapid succession of chief commissioners. Among these were men who made their mark in India, such as Sir Charles Crosthwaite, Sir Alexander Mackenzie, Sir Anthony (afterwards Lord) Macdonnell, Sir John Woodburn, Sir Denzil Ibbetson and Sir John Hewett. Only four of the later chief commissioners were men previously serving in the Central Provinces: Sir Andrew Fraser, Sir Reginald Craddock, Sir Benjamin Robertson and Sir Frank Sly (in whose time the chief commissionership was elevated into a governorship and council). The present governor, Sir Montagu Butler, is a Punjab officer.

The pioneer work of Sir Richard Temple and Sir John Morris, aided by a commission consisting mainly of military officers, provided the province with several important trunk roads, and with a land settlement on the zamindari system. The Tenancy Act of

1883 gave the tenantry of the province a degree of security in their holdings which no other zamindari province in India enjoys to a like extent. The land settlements then made have since been twice revised under a system which will always be associated with the name of Sir Bampfylde Fuller.

The first railway was opened in 1870, and the railway system of the present day extends to nearly 2,000 miles. The two trunk railways between Bombay and Calcutta pass through the north and south of the province respectively. The Marathi-speaking districts in the south and west are more advanced than the Hindi-speaking districts of the north and east.

There have been serious setbacks, for most disastrous famines occurred in 1867, 1897 and 1900, while there were serious crop failures in 1907, 1913, 1918 and 1920, which would have produced similar results but for the vastly improved protection afforded by the increased credit and prosperity of the people. Plague has also taken its toll of the large towns, the worst epidemics known having been in 1903 and 1909. The influenza outbreak of 1918 accounted for some 800,000 deaths.

The reformed constitution has had a chequered existence because of Nationalist majorities which refused to co-operate or to vote the pay of ministers, but matters have improved to some extent in the last few years.

History of Berar.—The fertile plain of Berar (the ancient Vidharba) has had a chequered history. It was under the sway of the various dynasties that ruled Southern India until the Mohammedan invasion at the end of the 13th century, when it formed a province of the Bahmani dynasty, but about 1490 a rebellious governor, Imad ul Mulk, declared his independence and established a kingdom, which was again wrested from his descendants in 1572 by the Ahmednagar king. It was ceded by him to the Moguls in 1595, when his own capital was besieged by them, and the Emperor Akbar's sons governed it together with Ahmednagar and Khandesh until Akbar's death in 1605. It then came under the rule of Malik Ambar the Abyssinian. On his death in 1626, the Emperor Shah Jehan once more annexed it.

Towards the end of the 17th century, when Mogul power was waning, Berar began to be overrun by the Mahrattas, who won from Delhi their claim to blackmail (*chanth*). In 1724 Nizam Asaf Jah, establishing the independent line of Nizams of Hyderabad, claimed *de jure* sovereignty over Berar. This claim was disputed by the Bhonsla rajahs, and for some 50 years the inhabitants were harried and ground down by this conflict of authorities. This was ended by Wellesley's victories of Assaye and Argaon in 1803, when the country west of the Wardha river was ceded to the Nizam.

Pindari and Bhil raiders, and also the exactions of their disputing rulers, harried the people. The Nizam pledged the revenues as security for loans taken by him, the result being further exactions from the Farmers General to whom the revenues had been assigned. The British at last intervened, in 1853, and a treaty was made with the nizam by which these territories came under British administration under the title of the Hyderabad Assigned Districts. On the subject of boundaries this treaty was again revised in 1860, and it was agreed that the British government should administer Berar in trust for the Nizam, to whom was given the balance of the revenues after the cost of the Hyderabad contingent and of the administration of these districts had been met. Lord Curzon later concluded a fresh treaty with the nizam whereby the latter agreed to give a perpetual lease of these districts to the British government in return for an annual payment of 25 lakhs of rupees.

The six districts of Berar were reduced to four and a commissioner's division attached to the Central Provinces, but the sovereign rights of the Nizam continued. His recent claim to the rendition of these districts has not been accepted by the British government, and would not be welcome to the people of Berar, who have been under British administration for some 74 years.

Berar, after centuries of harassment, has become a peaceful and prosperous sub-province, made wealthy by the cotton crop and cotton industry, and cultivated by as prosperous a tenantry as can be found anywhere in India outside the most highly irrigated

tracts. The revenue settlements of Berar are *ryotwari*, namely, made with the peasantry direct. The system follows generally that of the adjacent districts of Bombay, and village headmen in Berar perform, for a percentage remuneration on the revenue they collect, duties which, in the Central Provinces, are assigned to the *malguzars*, or village proprietors.

As Berar continues to be outside British India, its legislation has to be brought into effect by notification by the Governor-General, but it sends elected members to the Central Provinces Legislative Council, their position being legalized by their nominations to that council.

(R. H. C.)

CENTRAL RAILROAD COMPANY OF NEW JERSEY, THE. This American railway had its beginning in the Elizabethtown and Somerville railroad, incorporated in New Jersey in 1831, and in the Somerville and Easton railroad, incorporated in 1847. By a supplementary act the name was changed, on April 23, 1849, to the Central Railroad Company of New Jersey. It extended its lines and opened them for operation, as follows: 1852, White House, N.J. to Phillipsburg, N.J. 28 m.; 1864, Elizabeth, N.J. to Jersey City, N.J. 11.50 m.; 1872, Elizabethport, N.J. to Brills Junction, Newark, N.J. 5.45 miles. Since its incorporation, the company has grown in mileage largely through merger of other companies. In 1928 the system extended westward from Jersey City, N.J. to Scranton, Pa., and central and southern New Jersey is served through lines extending from Jersey City and Newark, through the centre of the State, to Bayside and Greenwich Pier, on Delaware bay. A line also serves the New Jersey coast resort points, and steamers are operated between New York and Atlantic Highlands, N.J., during the summer months. In all there were 452 m. of road in New Jersey and 239 m. in Pennsylvania, a total of 691 m. of road, and a total of 1,957.44 m. of tracks.

The entire line from Jersey City, N.J. to Scranton, Pa. serves a highly industrial region, including steel and cement industries. It is also the route of heavy anthracite shipments from mines to tide-water.

The capital stock outstanding on Dec. 31, 1927 was \$27,436,800; the funded debt \$60,842,000.

(R. B. W.)

CENTRAL SCHOOLS. The central school in England is a development of the primary school. It is the successor of the higher standard, higher grade and higher elementary schools, all of them being, like the central school, growths at the top of the elementary school. It differs from them, however, in that: (1) it is selective, (2) an entrance age of 11-12 years is commonly used, (3) the curriculum, less academic than that of a secondary school, commonly has a "bias," technical or commercial. At present it is mainly confined to the towns.

Experiments in the way of selective transfer were made in Manchester, but the definite establishment of the central school dates from the London scheme, drafted in 1910, and begun in 1911. The new schools gained from the beginning a high reputation for efficiency. Their essential features are: (1) Entrance is at the age of 11-12 years (11+), from the surrounding elementary schools, the "contributory schools," (2) the course is planned for four years, (3) each school is either technical or commercial, or, in the case of large schools, technical and commercial (at first, the word "industrial" was used, but this was changed to "technical" in 1927), (4) entrance is based upon (a) recommendations of head teachers and inspectors, (b) success in intra-school examinations, (c) relative success in the London junior county scholarship examinations. These last-mentioned examinations have for their chief object the distribution of scholarships to secondary schools. The "next best" are selected for the central schools.

The success of the London experiment has been due in the main to two facts: (1) That the London elementary education service, by virtue of its great size and its relatively high scale of salaries, contains a large number of extremely capable teachers, head and assistant. (2) The scheme was carefully prepared in detail before it was put in action; and the appointment of the staffs of the new schools, assistants as well as heads, was made with considerable care. The teaching of the staffs of these schools has stood at a remarkably high level since their formation.

The curriculum in a commercial central school includes 4 hours a week French (or German) for the whole course, 1½ hours shorthand (for the third and fourth years), 1 hour or more bookkeeping, in the third and fourth years, 3 to 5 hours typewriting, for the fourth or third and fourth years (optional, and out of school hours), 2 hours experimental (laboratory) science, 2 hours art, one half-day handicraft for the first and second years (boys), or domestic economy for the first, second and third years (girls). On the technical side, 10 to 12 hours a week are given to practical work throughout the course. In the case of boys, this consists of "science (including mensuration), drawing, clay modelling, wood and metal-work," leather work, printing, tile-making, bookbinding, and so forth. In the case of girls, it is described as consisting of "elementary science, domestic economy, drawing, practical hand-work, or other approved subjects." If a foreign language is taken in a technical central school, a minimum of 3 hours a week must be given to it. In the case of London central schools with a double bias, it was decided in 1927 to make the course of studies a common one for the first two years for both commercial and technical pupils. In 1927 there were in England 332 central schools (departments) offering a four-year course, and 277 offering a three-year course.

Some of the children leave immediately on reaching the age of 14+. This of course is commonest in the poorer areas, for economic reasons. A pledge signed by the parents, to keep the child at school until the completion of the course, has some moral effect, but it is not legally binding. A considerable number of pupils remain to the age of 15 or 16 years, and in many cases a fifth year course has been added to the original four.

See Spurley Hey, *The Central School* (1924), and articles in *The New Education* (1920) and *The Next Step in National Education* (1927).

(R. Jo.)

CENTRE-BOARD or DROP KEEL, a drop board or iron plate employed in the smaller kind of sailing boats in place of a fixed keel; it is housed in a trunk or casing so as to be capable of being lowered through the boat's bottom when required to give stability, or to prevent making leeway in a wind, and can be hoisted in shallow water or when running before the wind.

CENTUMVIRI, an ancient court of civil jurisdiction at Rome. The word is derived from *centum*, hundred, and *vir*, man. The antiquity of the court is attested by the symbol and formula used in its procedure, the lance (*hasta*) as the sign of true ownership, the oath (*sacramentum*), the ancient formula for recovery of property or assertion of liberty. Its concern was with matters of debt and of the property of which account was taken at the census. The *centumviri* were never regarded as magistrates, but as *judices*, and as such would be appointed for a fixed term of service by the magistrate, probably by the *praetor urbanus*. But in Cicero's time they were elected by the *Comitia Tributa*. They then numbered 105. Their original number is uncertain. It was increased by Augustus and in Pliny's time had reached 180. The office was probably open in quite early times to both patricians and plebeians.

BIBLIOGRAPHY.—A. H. J. Greenidge, *Legal Procedure of Cicero's Time*, pp. 40 et seq., 58 et seq., 182 et seq., 264 (1901); J. E. Sandys, *Companion to Latin Studies* (1921), with useful bibliography.

CENTURION (Lat. *centurio*), in the ancient Roman army, an officer in command of a *centuria*, originally a body of a hundred infantry, later the sixtieth part of the normal legion. There were, therefore, in the legion sixty centurions, who, though theoretically subordinate to the six military tribunes, were the actual working officers of the legion. For the most part the centurions were promoted from the ranks: they were arranged in a complicated order of seniority; the senior centurion of the legion (*primus pilus*) was an officer of very high importance. Besides commanding the centuries of the legion, centurions were "seconded" for various kinds of special service; e.g., for staff employment, the command of auxiliaries. (See ROMAN ARMY.)

See also J. E. Sandys, *Companion to Latin Studies* (1921) Section 752.

CENTURIOPE, a town of Sicily, province of Catania, 2,380ft. above sea-level, 7m. N. of the railway station of Catenanuova-

Centuripe, which is 28m. W. from Catania. It was formerly called Centorbi (anc. Κεντόριπα) or Centuripae. Pop. (1921) 13,883 (town); 15,960 (commune). Thucydides called it a Sicel city; it allied itself with Athens against Syracuse, and remained independent (apart from Agathocles' domination) till the first Punic War. Cicero, perhaps exaggerating, called it the largest and richest city in Sicily, with 10,000 inhabitants cultivating a large territory. It appears to have suffered much in the war against Sextus Pompeius, and not to have regained its former prosperity under the empire. Frederick II. partly destroyed it in 1233, and its ruin was completed by Charles of Anjou. Considerable remains of buildings, including Hellenistic houses with wall paintings, thermal establishments and cisterns, and a number of substruction walls on the steep slopes, mostly of the Roman period, still exist; Hellenistic *terra-cottas* and finely painted vases, both of local manufacture, have been discovered, and a large number of tombs have been excavated. It is surrounded by deep ravines, due to erosion.

See G. Libertini, *Centuripe* (Catania, 1926).

CENTURY, the name for a unit (*centuria*) in the Roman army, originally amounting to 100 men, and for one of the divisions into which the Roman people was separated for voting purposes (see *COMITIA*). The word is applied more particularly to a period of 100 years. The "century-plant" is a name given to the agave (*q.v.*), or American aloe, from the supposition that it flowers once only in every 100 years.

CEOS, an island in the Aegean sea (Gr. Κέως mod. ΖΕΑ or ΤΖΙΑ), 14 m. off the coast of Attica, in the group of the Cyclades and the eparchy of Syra. Its greatest length is about 15 m. and its breadth about 8 m. Mount Elias in the centre is 1,864 ft. high. Among its productions are lemons, citrons, olives, wine, honey and valonia. There were formerly four towns in the island:—Iulis, about 3 m. from the north-west shore, represented by the town of Zea, Coressia, the harbour of Iulis, Carthaea, in the south-east, at St'ais Polais village; and Poieëssa, in the south-west. Iulis was the birthplace of the lyric poets Simonides and Bacchylides, the philosophers Prodicus and Ariston, and the physician Erasistratus. From its excellent code, the title of Cean Laws passed into a proverb. One of them forbade a citizen to protract his life beyond sixty years. Ceos fought on the Greek side at Artemisium and Salamis; joined the Delian League, and also the Athenian alliance in 377 B.C.; revolted in 363–362, but was reduced again. Athens then assumed monopoly of the ruddle, or red earth, the most valuable product of the island. Ceos was divided in A.D. 1207 among four Italian adventurers; was included in the duchy of Naxos in 1537; passed under Turkish rule in 1566 and thence into the Greek kingdom. Silver coins of Carthaea and Coressia date from the 6th century B.C. (see *NUMISMATICS: Greek*, "Cyclades and Sporades"). See Pridik, *De Cei Insulae rebus* (1892).

CEPHALIC INDEX, the percentage of breadth to length in any skull. The longer diameter of a skull, the antero-posterior diameter is taken as 100; if the shorter or transverse diameter exceeds 80 the skull is broad (brachycephalic), if between 80 and 75, it is mesaticephalic, and if below 75, dolichocephalic (see *RACES OF MANKIND*).

CEPHALONIA, the largest of the Ionian Islands on the west side of the Greek mainland (Ital. *Cefalonia*, ancient and modern official Greek *Cephallenia*, Κεφαλληνία). Pop. (1920) 71,186. Its length is 31 m. and its breadth varies from about 20 m. in the southern portion to less than 3 m. in the promontory opposite Ithaca. The whole island is mountainous, the main range running from north-west to south-east. The ancient Mount Aenos, now Elato or Monte Negro (5,315 ft.), frequently has snow for several months. There are few permanent streams except the Rakli, and springs are apt to fail in dry summers. In the west a gulf runs up from the south, a distance of about 7 m.; on its east side stands the chief town Argostoli (*q.v.*), and on its west side the rival city of Lixouri. About a mile west of Argostoli, a stream of sea water running into a chasm in the shore is made to operate "sea-mills." About 5 m. from Argostoli is the Venetian castle of St. George. The ruins of Crane are close to Argostoli; those of Pale to Lixouri. On the other side of the island the remains

of Same are on the bay of the same name, those of Proni or Pronni, farther south above the vale of Rakli. All these have impressive walls, Cyclopean and Hellenic. Near the village of Scala is a nameless site with Roman baths and tessellated pavements, a brick temple and rock-tombs. The inhabitants of Cephallonia have always been industrious in the construction of cultivation terraces. But only a small proportion of the soil is under cultivation, and the grain production meagre. The chief crop is the currant, in which Cephallonia surpasses Zante. The fruit is smaller than that of the Morea, and has a peculiar flavour; it finds a market mainly in Holland, Belgium and Germany. The grape vine also is grown, for wine. The olive crop is of importance, and cotton is now grown in the low grounds. Manufactures are few: lace from aloe-fibre, Turkey carpets, and basket-work in the villages; and boat-building at both the principal towns. Of all the seven "Ionian Islands" Cephallonia and Zante (*q.v.*) are most purely Greek.

History.—In the Homeric poems the Cephallenes are subjects of Ulysses, but Cephallonia is not mentioned: probably it is represented by Same (see, however, under *ITHACA*). In the Persian War the island took but little part; in the Peloponnesian it sided with the Athenians. The town of Pale supported the Aetolian cause and was vainly besieged by Philip V. of Macedon in 218 B.C. In 189 B.C. all the cities surrendered to the Romans, but Same afterwards revolted, and was reduced only after a siege of four months. The island was presented by Hadrian to Athens, but it appears again later as "free and autonomous." After the division of the Roman empire, it was attached to Byzantium till 1082, when it was captured by Robert Guiscard, who died, however, during the revolt of 1085. In 1204 it was assigned to Gaius, prince of Tarentum, who accepted the protection of Venice in 1215; and after 1225 it was held with Santa Maura and Zante by the Tocco family at Naples. Formally made over to Venice in 1350 by the prince of Tarentum, it fell to the Turks from 1479 to 1500, but Venice held it again till the fall of the republic.

For some time it was administered for the French government, but in 1809 it was taken by the British. Under vigorous governors, like Major de Bosset (1809–13) and Sir Charles Napier (1818–1827), the island advanced in material prosperity, but was several times the scene of political disturbances. It retained longer than the sister islands traces of feudal influence exerted by the landed proprietors, but has been gradually becoming more democratic. Under the Venetians it was divided into eight districts, and an elaborate system of police was in force; since its annexation to Greece it has been broken up into twenty demarchies, each with its separate jurisdiction and revenues, and the police system has been abolished.

BIBLIOGRAPHY.—A special treatise on the antiquities of Cephallonia was written by Petrus Maurocenus. See Holland's *Travels* (1815); Ansted's *Ionian Islands* (1863); Viscount Kirkwall's *Four Years in Ionian Islands* (1864); Wiebel's *Die Insel Kephallonia*; parliamentary papers. CEPHALOPODA, a group of highly organized invertebrate animals of exclusively marine distribution constituting a class of the phylum Mollusca. Some 150 genera of living cephalopods are known, of which the octopus, the squid and the cuttlefish (*q.v.*) are the most familiar representatives. The extinct forms, however, outnumber the living, the class having attained very great diversity in late Palaeozoic and Mesozoic times. Of extinct cephalopods the Ammonites (*q.v.*) and Belemnites are the most familiar examples.

The Cephalopoda agree with the rest of the Mollusca in general structure and appear to have the closest affinity with the Gastropoda (snails, periwinkles, limpets, etc.). They have a more or less elongate body (visceral mass) covered by a "mantle." The latter secretes a shell and encloses a cavity in which the gills are suspended. The alimentary canal is furnished with the characteristic molluscan rasping tongue or radula. These animals differ from the rest of the Mollusca primarily in that the head and foot are approximated, so that the mouth is situated in the middle of the foot, and the edges of the latter are drawn out into a number

of appendages (arms and tentacles). The area just above the edge of the foot, from which the epipodium of the Gastropoda is developed, is produced to form a peculiar organ of locomotion, the funnel. The majority of living cephalopods possess fins and their shell is in a reduced or degenerate condition, a tendency apparent in many fossil forms. In short the leading feature of cephalopod organization and the dominating theme of their

FROM WILLEY, "ZOOLOGICAL RESULTS" (QUARTERLY JOURNAL OF MICROSCOPICAL SCIENCE)
FIG. 1.—NAUTILUS POM-
PILIUS

evolution is the development of organs that subserve a vigorous aggressive mode of life unhampered by the heavy calcareous shell that is carried by their more sedentary and inactive relatives. Nevertheless the living *Nautilus* (q.v.) and many forms now extinct retain the shell in a complete condition.

For invertebrate animals the Cephalopoda attain a large average size and the genus *Architeuthis* (giant squids) are actually the largest living invertebrates, the Atlantic species *Architeuthis princeps* attaining a total length of 52 ft. (inclusive of the tentacles). The shell of the fossil ammonite (*Pachydiscus septemradensis* from Westphalia (Cretaceous) measures 6 ft. 8 in. in diameter and is the largest shelled mollusc. Though not such a flourishing group as they were in secondary times, the Cephalopoda are still one of the dominating groups of marine animals. They are the indomitable prey of whales and other marine carnivora and the relentless enemies of Crustacea and small fishes. The bizarre appearance of Cephalopoda, their sinister eyes and the secretive habits of some of the shore-living forms have made them a subject of legend among imaginative peoples. Modern authors have not hesitated to exaggerate the horrors of the attack of a giant squid or octopus; and Denis de Montfort and Victor Hugo have invested them with a melodramatic violence that has taken root in popular fancy. Nor is this reputation for ferocity unmerited, as far as attacks on human subjects are concerned.

Classification.—In the past decade the classification of the Cephalopoda has undergone a considerable amount of revision principally owing to the work of Naef and other German zoologists. The following is the scheme drawn up by Grimpe (1922):

- Class. Cephalopoda.
 - Sub class 1. Protocephalopoda.
 - Order 1. Nautiloidea.
 - Order 2. Ammonoidea.
 - Sub class 2. Metacephalopoda.
 - Order 1. Octopoda.
 - Sub order 1. Cirrata.
 - Sub order 2. Paleoctopoda.
 - Sub order 3. Incirrata.
 - Order 2. Decapoda.
 - Sub order 1. Sepioidea.
 - Sub order 2. Teuthoidea.
 - Sub order 3. Belemnoida.

It will be seen that this scheme recognizes the fundamental distinction proposed by Owen, which separates *Nautilus* and its allies from the octopods, squids and cuttlefish. This distinction is without doubt sound, for it rests on the fact that, within the limits of our knowledge, the *Nautilus* has a more primitive organization than the rest of the Cephalopoda. It has a wholly external coiled shell, four gills and kidneys, and other features which we are justly entitled to regard as primitive. It must, however, be recognized that we can deal only with the shell of the extinct nautiloids and the ammonites and we do not know if the rest of their organization was like that of *Nautilus*. It is a fair inference, however, that the living and fossil nautiloids and the ammonoids are a natural group. Grimpe's scheme differs herein from the older classification in raising the main sub-divisions to the status of sub-classes and in thus emphasizing their distinctness as is done in the case of the streptoneurous and euthyneurous gastropods. This is an advantage and may be safely adopted.

The classification of the Dibranchia proposed by Naef and Grimpe involves a more fundamental change. In its primary division into Octopoda and Decapoda it follows traditional lines.

In its secondary division of these groups, however, it departs from the latter for reasons which appear to us well-founded. Among the Octopoda the fossil *Paleoctopus* merits recognition as representing a separate sub-order. It is, however, in the reorganization of the Decapoda that the new scheme has most to recommend it. The recognition of the three sub-orders Sepioidea,

BY COURTESY OF F. M. DUNCAN
FIG. 2.—AN OCTOPUS RESTING ON
THE SEA BOTTOM

Teuthoidea and Belemnoida has the advantage of taking into account our knowledge of the phylogeny of the order, and marking the three great tendencies that can be recognized in the evolution of the decapod shell. The older "Egopsida" are, as far as nearly all their living representatives are concerned, preserved

intact. But the Belemnite-like fossil forms are quite reasonably abstracted from them and placed in a separate sub-order. The older "Myopsida," which contained forms with radically dissimilar shells, such as *Sepia* and *Loligo*, are resolved into two sections, one of which (*Sepia*, *Sepioida*, *Spirula* and certain extinct forms) is elevated to sub-ordinal rank (the *Sepioidea*), while the other (*Loligo*, etc.) is treated as a section of the Teuthoidea along with the Egopsida (as above restricted). It may be reasonably objected that this has the effect of placing forms such as *Sepioida* which, like *Loligo*, have a chitinous, non-calcified shell in a different sub-order from *Loligo* and the Egopsida, and of disregarding certain points of similarity between the *Loliginidae* and *Sepiidae*. Nevertheless it is held that in spite of this fact, *Sepioida* and its allies are more closely allied anatomically to *Spirula*, which has the distinction of being the only living dibranch with a coiled and partly external calcareous shell, than to *Loligo* and the Egopsida, and that phylogenetically they can thus be attached to the sepioid stock. Concerning the affinities of *Spirula*, a good deal of controversy has taken place. It seems best to accept Chun's view that it is a sepioid form, as the reasons set forth at length by him in his study of this interesting genus (*Wissenschaftliche Ergebnisse der Deutschen Tiefsee Expedn. Bd. 18, 1915*) are sufficiently convincing.

Anatomy and Physiology.—In fig. 3 is given a diagram illustrating the structure of a cephalopod. Though schematic, this diagram gives a very fair idea of the organization of such forms as the common cuttlefish, squid and octopus. The view has been widely accepted that in the Cephalopoda the surface of the foot has become very much shortened as compared with that

FROM LANKESTER, "TREATISE ON ZOOLOGY" (BLACK)
FIG. 3.—DIAGRAM ILLUSTRATING
THE STRUCTURE OF A CEPHALOPOD

of other molluscs, the length of the body being reduced, while its height is increased. This modification of what we may assume to be the original plan of molluscan organization is held to have been brought about by the foot shifting forwards until it became involved in the head, its edges growing round and encircling the mouth. It will be seen in the section on Development that this process is actually indicated in the embryo, so that on this, as well as other grounds,

we may regard the current view as to how the cephalopod organization was attained as substantially accurate. As to which surface of a cephalopod should be called anterior and which posterior we are on sound morphological ground if we regard the head and foot as ventral and the mantle-cavity as posterior. Nevertheless in many cephalopods, which move about by swimming, the long axis of the body becomes horizontal, like that of a fish, and the anterior surface might be more appropriately termed "upper" or "dorsal" and the posterior surface "under" or "ventral."

The viscera of our typical cephalopod are covered by a dome-shaped or elongated sheath of skin, the mantle, which is in close

contact with the body anteriorly, but posteriorly is free and encloses the mantle-cavity, into which the gills project and the anus, kidneys and reproductive system open.

Below the visceral mass are the head and foot which together continue the main mass of the body. On the posterior side of this

FROM CHUN, "WISSENSCHAFTLICHE ERGEBNISSE DER DEUTSCHEN TIEFSEE-EXPEDITION" (FISCHER)

FIG. 4.—CHIROTEUTHIS IMPERATOR

head-foot (cephalo-pedal mass) is a muscular tube, the funnel. The circlet of arms encircles the mouth.

The main divergences of structure have already been indicated in the section on classification; but, for the sake of rendering clear the importance of some of the details which follow, it is necessary to recall two important facts, first that *Nautilus* with its external coiled shell represents a more primitive and less specialized type than do the Dibranchia, a grade of organization seen in many anatomical features, and secondly that the Dibranchia have acquired a more active and vigorous mode of life that has led to certain marked departures in structure and function from the type represented by *Nautilus* and (we may assume) the ammonites. Lastly among the Dibranchia themselves certain important habitudinal divergences are established, and hand in hand with these we must note structural and physiological adaptations, e.g., to a life permanently spent in the great depths of the sea, to a permanent floating life or to a more active and aggressive existence near the surface. The details of cephalopod anatomy and physiology may be studied in any good zoological text-book or in divers special papers and monographs. The following account attempts to eliminate detail and to present the main structural and physiological features of the class in rela-

FROM "GUIDE TO FOSSIL INVERTEBRATES" (BRITISH MUSEUM)
FIG. 5.—A TRIASSIC AMMONITE, TRACHYCERAS AON

tion to the mode of life of the animals concerned.

External Anatomy and General Organization.—The nautiloids and ammonites were in all probability mainly shallow-water animals living near the bottom. They relied for protection on a calcareous external shell and their speed of movement was probably inconsiderable. The modern *Nautilus* represents this mode of life pretty closely. The Dibranchia are, as we have seen, on the whole more active, and swimming or floating has become their characteristic mode of locomotion. Accordingly we notice the following features in their external organizations: (1) The mantle, which in the majority of molluscs and in the Tetrabranchia has a passive rôle and merely contains the viscera and secretes the shell, has become involved in the mechanism of locomotion. It has lost or almost entirely lost the rigid shell and has become highly muscular. Its expansion and contraction promote a locomotor water-current by drawing water into the mantle-cavity and expelling it through the funnel. The rapid ejection of this jet of water enables the animal to execute rapid retrograde movements. As a means of sealing the mantle-aperture while the locomotor jet is under compression, there is developed an "adhesive apparatus," a cartilaginous stud or ridge on each side of the edge of the mantle and a pair of corresponding sockets on the head into which the studs or ridges fit so that the mantle edge is locked to the head. (2) The funnel in *Nautilus*

FROM "GUIDE TO FOSSIL INVERTEBRATES" (BRITISH MUSEUM)
FIG. 6.—UNCOILED CRETACEOUS AMMONITES
Upper, *Crioceratites emerici*.
Lower, *Heteroceras emericianum*

is represented merely by two muscular folds which meet in the middle line. In the Dibranchia these folds are completely fused up and form a complete tube. (3) Additional locomotor appendages in the shape of fins are developed from the sides of the mantle. These may become very large and no doubt assist in balancing the animal. (4) In accordance with their active, mainly reptorial mode of life, the circumoral appendages, which are many and feebly developed in *Nautilus*, are fewer in number in the Dibranchia, but more muscular and provided with suckers which in the Decapoda are furnished with horny, often toothed rims. In certain forms the teeth of the suckers are modified as large and formidable hooks. Two of the arms are specially modified in the Decapoda for the capture of prey.

Internal Anatomy.—(1) *Internal supporting structures.* All the Cephalopoda have an internal cartilaginous covering of the main ganglia of the nervous system. In the Dibranchia this is more complete than it is in *Nautilus*. It encircles the ganglia and constitutes a kind of skull. Besides this structure the greater

FROM "GUIDE TO MOLLUSCA" (BRITISH MUSEUM)

FIG. 7.—SPIRULA PERONII

mobility of the Dibranchia is secured by other skeletal supports of the muscles which are found at the base of the fins, in the "neck," gills and arms of various forms. (2) *Viscera.* The alimentary system of the Cephalopoda consists of a muscular buccal mass furnished with a pair of jaws (mandibles) and a rasping tongue (radula), oesophagus, salivary glands, stomach, coecum, liver and intestine. Efficient mastication is secured by the

powerful mandibles and sharp-pointed teeth of the radula. In the Octopoda the oesophagus is expanded to form a crop and in the Cirrata, possibly in relation to the special diet of these mainly deep-sea animals, which seem to feed on bottom débris, the radula is frequently degenerate or absent and there is a "second stomach," a capacious dilatation of the intestine. In the

FROM ROBSON, "ANNALS AND MAGAZINE OF NATURAL HISTORY" (TAYLOR & FRANCIS)
FIG. 8.—ARM-HOOK OF MESONYCHOTEUTHIS HAMILTONI

Dibranchia the pancreatic element of the liver is partly separated from the latter. Nearly all the members of this subclass have a diverticulum of the intestine situated near the anus in which is secreted a dark fluid ("sepia" or "ink"). This can be forcibly discharged, and the dark cloud thus formed in the water serves as a means of escape from enemies. (See section on Natural History.) This so-called ink-sac is absent in *Nautilus* and in certain deep-sea Octopoda.

Circulatory and Respiratory System.—These systems are very highly developed in the Cephalopoda. Unlike the rest of the Mollusca the blood is conveyed to and from the tissues in vessels instead of mainly through a system of diffuse cavities (*lacunae*), though the vascular system of *Nautilus* is partly lacunar. The process of circulation and oxygenation is more concentrated in the Dibranchia, which have only two cardiac auricles and two gills instead of four auricles and four gills as in *Nautilus*. The mechanism of respiration is likewise more efficient in the Dibranchia, the rhythmical contractions and expansion of the mantle musculature procuring a very effective circulation of water over the gills. The latter are feather-like in general plan, *i.e.*, they consist of a central axis with side-branches disposed down each side of it. There are as many as 40 filaments a side in some Dibranchia; but in the Octopoda they are less numerous, and in abyssal forms (*e.g.*, the Cirroteuthidae) they are very much reduced in number and length.

FIG. 9.—HORNY RINGS OF SUCKERS OF TODARODES SAGITTATUS

Note the sharp teeth on the rims

Renal Organs.—The excretion of nitrogenous waste is carried out exclusively by the kidneys; the liver, which in certain other molluscs has an excretory as well as digestive rôle, does not participate in this function. There are four kidneys in *Nautilus* and two in the Dibranchia.

Nervous System.—The chief ganglionic centres of the Cephalopoda are concentrated in the head and are very closely approximated. Such intimate union is not usually found in other molluscs, but is nevertheless seen in certain Gastropoda. This condensation of the central nervous system is seen in *Nautilus* and is carried still further in certain Dibranchia. Features indicative of functional specialization are found in the latter, *e.g.*, in some of the Teuthoidea the cerebral centres are subdivided and the pedal ganglia are likewise divided into brachial and epipodial elements which innervate the arms and funnel respectively. The sense-organs of the Cephalopoda are eyes, rhinophores (olfactory organs), statocysts (organs for the nervous regulation of balance) and tactile structures. The eyes of *Nautilus* are of a more primitive construction than those of the Dibranchia in that they have no retractive lens and the optic cavity is open to the exterior. In the Dibranchia the eyes are very complex and approach those of the Vertebrata in efficiency.

FROM LANKESTER, "TREATISE ON ZOOLOGY" (BLACK)
FIG. 10.—ROW OF TEETH IN RADULA OF AN OCTOPUS

Reproductive System.—The sexes are separate in the Cephalopoda. No instances of hermaphroditism or of sex-change such as are found in other molluscs have so far been reported in this

class. Sexual dimorphism is of fairly regular occurrence; but it is usually expressed in slight differences of size and the proportion of various parts. In the pelagic Argonautidae (Octopoda) the male is very much smaller than the female, and in the cuttlefish (*Dorotosepion confusa*) the males are distinguished by the possession of long tail-like prolongations of the fins. In nearly all cephalopods the males are in addition distinguished by the modification of one or more of the appendages as an organ of copulation. The male reproductive system is on the whole a

FROM JATTA, "CEPHALOPODI" IN "FAUNA UND FLORA DES GOLFES VON NEAPEL" (STAZIONE ZOOLOGICA DI NAPOLI)

FIG. 11.—HECTOCOTYLUS OF OCTOPUS SALUTII

little more complex than the female, chiefly in relation to the method of copulation. The spermatozoa are transferred by the male to the female in long tubes (spermatophores) which are formed in a special sac (Needham's organ) on the course of the male *vas deferens*. These tubes are deposited either in the neighbourhood of the mouth of the female (*Nautilus*; *Sepia*, *Loligo* and other Teuthoidea) or in the mantle-cavity (Octopoda; certain Teuthoidea) by means of the copulatory organ (hectocotylus [Dibranchia]: *spadix* [*Nautilus*]). The latter is a simple spoon-like modification of one of the arms in the Octopoda. In the Decapoda a great diversity of modifications is found which may involve more than one arm. Similarly in *Nautilus* an accessory copulatory organ (*antispadix*) is found. It has recently been suggested that some of the peculiar modifications found in the Decapoda enable the copulatory arm or arms to be used as an organ of stimulation.

Colour Change and Luminescence.—Besides the permanent colour of the skin, the Dibranchia possess a cutaneous system of contractile cells (chromatophores) containing pigment which can be expanded or contracted so as to exhibit or conceal the pigment either of all the cells simultaneously or only of those containing a certain pigment. The circumstances in which these changes are brought about are discussed in the section on Natural History.

In certain Decapoda, principally those which live at great depths, special light-organs are developed in various regions of the mantle, arms and head. These organs are not found in *Nautilus* and the Octopoda (except in *Melanoteuthis lucens*).

FROM LANKESTER, "TREATISE ON ZOOLOGY" (BLACK)

FIG. 12.—THE MANTLE CAVITY OF A CUTTLEFISH (*SEPIA*) OPENED IN ORDER TO DISPLAY ITS CONTENTS

They are only sparsely found in the littoral *Sepiidae* and *Loliginidae*; but a special type of light-organ said to produce the peculiar phenomenon of "bacterial light" has been described in certain species of *Sepiola* and *Loligo* (Meyer: Pierantoni: Robson).

Development.—The development of *Nautilus* is unfortunately not yet known, so that if any clues to the phylogeny of the cephalopods may be obtainable from the embryology of their

most primitive living representative, they are still withheld from us. The eggs of all cephalopods are provided with a remarkable amount of yolk so that, unlike that of the rest of the Mollusca, the segmentation is incomplete and restricted to one end of the egg. The embryo is likewise localized at that end and the ectoderm appears stretched out over one extremity of a large mass of yolk. Later on, a sheet of cells is developed below the ectoderm, commencing from that edge of the ectoderm at which the anus is subsequently developed; and after this, cells migrating inwards from the ectoderm give rise to the mesendoderm. The development of the various organs need not occupy us; but it is necessary to point out that the mouth in the early stage of development is not surrounded by the arm-rudiments. The latter arise as outgrowths of the lateral and posterior edges of the primordial embryonic area. These outgrowths pass forwards during later development until they reach and encircle the mouth. The funnel arises as a paired outgrowth of the same area, a condition which is retained in the adult *Nautilus*, while in the Dibranchia the two portions fuse together in the median line. The development of the Cephalopoda varies somewhat after the germ layers have been developed, according as to whether there is a yolk-sac or not. The embryo of *Sepia*, *Loligo* and *Octopus* is provided with a yolk-sac which may become partly internal; while in certain Decapoda presumed to be archaic there is less yolk and the yolk-sac is practically absent ("Egopsid embryo" of Grenacher). Nevertheless, although we may regard the latter mode of development as less specialized than that of the heavily yolked egg, e.g., of *Sepia*, there is no certain indication in the development of any known cephalopod of those larval phases that characterize the development of other Mollusca. The embryological history of the members of the Cephalopoda reveals as much specialization and differentiation from the more primitive molluscan type of development as does the structure of the adult.

Phylogeny and Evolution.—The structure of the soft parts of fossil cephalopods is only very scantily known, so that our knowledge of the evolution of the class since its first appearance in Cambrian times is largely based on the shell. It thus follows that our main division of the class into Tetrabranchia and Dibranchia, based as it is on the structure of the gills and other primitive traits seen in the visceral anatomy of *Nautilus*, has little relation to our knowledge of the primitive nautiloids and ammonoids. Similarly our knowledge of the evolution of the Octopoda, in which the shell is vestigial and non-calcified, is rather compromised by the absence of verifiable fossil remains.

In order to understand the evolutionary history of the Cephalopoda as revealed by the geological record, it is necessary to allude to the shell of *Nautilus*, which, by reason of its general organization, is regarded as the most primitive living cephalopod. This shell is coiled and subdivided into a number of closed chambers, the last of which is occupied by the animal. Throughout the system of chambers runs a median tube, the siphuncle. The earliest forms which we can recognize as cephalopods are found in Cambrian rocks. In *Orthoceras* (fig. 17) we see the unmistakable chambered shell and median siphuncle of the nautiloid.

The shell is, however, straight, not coiled. At a later stage we find the shell becoming coiled like that of a true *Nautilus*. This is well seen in the Silurian *Ophidioceras*. In Triassic rocks are found remains closely resembling our modern *Nautilus*; but the latter did not actually appear until the early Tertiary.

This short sketch gives us a clue to the first stage in the evolution of the Cephalopoda. If we accept the view that the Mollusca are a homogeneous group, it is reasonable to suppose that the primitive Mollusca from which the Cephalopoda sprang were provided with a simple cap-like shell not unlike that of a limpet. What circumstances of adaptation or internal momentum dictated the lines on which cephalopod evolution should proceed are not known; but the first result was an elongation of the shell achieved by the deposition of lime salts around the edge of the primitive cap-like shell as the animal progressively shifted its position away from the apex. At each successive growth-period the back of the visceral mass secreted a partition (septum), thus forming the successive compartments of the nautiloid shell. The elongate shell thus produced, which we see in *Orthoceras*, no doubt became unmanageable and liable to injury. As in the case of the Gastropoda, it became coiled, which had the mechanical advantage of saving the shell from accident and making it more manageable. The second order of tetrabranchs, the ammonites, which are only known from fossil forms, was a very large group and the plentiful remains of their shells at certain horizons has provided material for special studies of evolutionary phenomena at once fascinating and baffling. The ammonites are ranked as Tetrabranchia on conchological grounds; but we do not know in fact whether they possessed the anatomical structure of the nautiloids. They differed essentially from the true nautiloids in having a marginal siphon and a persistent embryonic whorl at the apex of the shell (protoconch). It is customary to derive them from Devonian forms with straight shells, such as *Bactrites*, though in fact *Bactrites* itself has certain nautiloid traits. Coiled ammonites appear in the upper Devonian (*Goniatites*), and thereafter follow a great variety of forms. They are distinguished by tendencies towards uncoiling and great complexity of the sutures (line of junction between the septa and the main shell-wall) which illustrate remarkable phenomena of growth (mostly modifications of the principle of Recapitulation). Some lineages (or evolutionary strains) illustrate retrogressive evolution, the later members of such series reacquiring traits seen in earlier stages of the series. These retrogressive stages are especially noticeable in the Cretaceous period, at the end of which the ammonites became extinct. It is not yet safe to say that this group as a whole ran a straight course through increasing complexity to a climax from which they passed to senescence and ultimate decay. It is tempting to read such a plain evolutionary theme into their story; but it seems more likely that as Swynnerton suggests, they were cut off when still a flourishing group by a great secular "revolution" of climate and earth-change, rather than by the exhaustion of their own evolutionary momentum. The history of the dibranchiate Cephalopoda is dominated by one main evolutionary theme. Our modern squids, cuttlefish and octopods are distinguished from the nautiloid forms by the possession of an internal and partly degenerate shell. In one form alone (*Spirula*) the shell is still partly external. The position and state of the shell in the

FIG. 16.—LARVA OF CHIROTEUTHIS ('DOVATOPSIS' STAGE)

Dibranchia is due to the progressive overgrowth of the shell by the mantle and the formation around the shell of a secondary sheath, the various parts of which eventually become larger than the shell itself. The loss of the true shell probably went hand in hand with the gradual acquisition of an active swimming habit, in which the protection of a rigid outer covering was replaced by greater mobility entailing the development of

FROM "GUIDE TO FOSSIL INVERTEBRATES" (BRITISH MUSEUM)

FIG. 17.—DIAGRAM OF SECTIONS THROUGH THE SHELL OF PALAEOZOIC NAUTILOIDEA, SHOWING THE CHAMBERED STRUCTURE

stronger pallial muscles. At the same time the acquisition of a fresh orientation probably entailed a readjustment of the centre of gravity of the animal, the heavy, more or less terminal shell being incompatible with rapid movement in a horizontal position. Of forms which connect the Dibranchia with the Tetrabranchia we have no direct evidence. According to Naef we may distinguish certain orthoceratid nautiloids which show an approach to the oldest Dibranchia; but it is not until Triassic times that we meet in *Aulacoceras* unmistakable evidence of the modification of the shell. This tendency is seen at its best in the Belemnites. It consists primarily in the enclosure of the apex of the shell in an external calcified sheath, the guard, and the development of an accessory plate, the pro-ostracum, at the anterior end of the shell. The forms which exhibit these modifications were undoubtedly dibranchiates, as they possessed the characteristic ink-sac and hooks on their suckers. The belemnites gave rise to several lines of descent. In one of these the guard is reduced and the original shell (phragmocone) is coiled (*Spirulirostra*). Further reduction of the guard and more extensive coiling of the phragmocone produced the shell of the modern *Spirula*. In another line the guard is similarly reduced, and the extension of the phragmoconal septa as closely set and numerous layers up the surface of the pro-ostracum led through the *BeLOSEPIA* to the modern cuttlefish. The modern Teuthoidea (*Loliginidae* and "Egopsida") are distinguished by the loss of phragmocone and guard and the persistence of the pro-ostracum as a horny "pen." These forms appear in the Jurassic and are probably developed from belemnite-like ancestors. Of living Teuthoidea *Ommastrephes* preserves a trace of the phragmocone.

Owing to the great reduction of the shell in living Octopoda, in which it persists as fine cartilaginous "stylets" or as somewhat better-developed fin-supports (Cirrata), the stylets, or fin-sup-

ports, are usually regarded as vestiges of the shell; but it is possible that this interpretation is wrong. We have no knowledge of the ancestry of this group. The structure of *Paleoctopus newboldi* from the Cretaceous of Syria afford no clue to the early stages of octopod evolution. This form combines cirromorph and

octopod characters; but in general it appears to be more octopus-like. Of the modern Octopoda it is likely that the Cirrata, in spite of much specialization in relation to the abyssal habit, are an older group than the true octopods. As far as the rudiment of the shell is concerned such forms as *Cirroteuthis mülleri* and *Vampyroteuthis* are more primitive than *Octopus*, *Eledone* and the *Argonautidae*.

Distribution and Natural History.

The Cephalopoda are exclusively marine animals. No authentic records are available of their occupation of fresh or brackish water. Although they are occasionally carried into estuaries, they do not tolerate water of reduced salinity. In this respect they are comparable with the Amphineura and Scaphopoda among other Mollusca and with the Echinoderma and Brachiopoda. It is interesting, but rather fruitless to speculate as to why so highly organized and dominant a group has never, as far as we know, accommodated itself to fresh water. The fact that there

FROM "GUIDE TO FOSSIL INVERTEBRATES" (BRITISH MUSEUM)

FIG. 19.—THE BELEMNITE AND ITS DESCENDANTS. SECTIONS THROUGH THE MIDDLE OF THE SHELL

are many littoral species further emphasizes this exclusiveness. One record is known to the author of an octopod being found living at the mouth of a fresh water stream (Hoyle, 1907), and it is interesting to note that certain species have penetrated into those areas of the Suez canal which have a higher salinity than that of normal sea water. No differences have so far been recorded in the numerical frequency of the cephalopods of those parts of the ocean which have a relatively low salinity (e.g., under 34 per mille, as in Arctic and Antarctic waters), and those with an average or high salinity (35 per mille and upwards). In areas of extremely low salinity, such as the Baltic sea, cephalopods are very sparsely represented.

Concerning the horizontal (geographical) distribution of cephalopods, as far as it can be dissociated from the vertical distribution (see later), little need be said. Many genera and some species are, in the light of modern taxonomy, cosmopolitan in their distribution. Thus the small egopsids *Cranchia scabra* and *Pyrgopsis pacificus* are found in the Atlantic, Indian and Pacific oceans, though they do not pass into high latitudes. The common European *Octopus vulgaris* and *O. macropus* have, on unimpeachable authority, been recorded from the Far East. On the whole the distribution of the species and some of the genera is very much the same as in other great groups of marine animals, i.e., it is in general determined by the great oceanic "divides." Thus the Canaries current cuts off a north-east Atlantic fauna from an equatorial and south Atlantic one at about latitude 18°N., and the great "divide" off Cape Agulhas (South Africa) separates Atlantic and Indo-Pacific faunas. Nevertheless, these barriers (due to marked changes in salinity and temperature) seem to be by no means rigid in their effects. Several Mediterranean species are found in the south Atlantic and certain species are common to the Atlantic and Indo-Pacific regions; so that the species can only be grouped into faunas in a very broad fashion. Other qualifications have also to be made. In the first place it is very likely that many species which occur at the surface, e.g., in the cold

FROM "GUIDE TO FOSSIL INVERTEBRATES" (BRITISH MUSEUM)

FIG. 18.—RESTORATION OF THE ANIMAL AND SHELL OF A BELEMNITE

Left, dorsal view; right, ventral view

Benguela current of the south-east Atlantic may be found in deeper water in the Indian ocean, so that the Agulhas "divide" may be only effective at the surface and have a limiting effect only on those Cephalopoda which cannot descend to great depths. Secondly, the identification of species from contrasted areas should depend on a very exact taxonomy, and this is not always easy in practice, as the condition and number of specimens collected is not always satisfactory. It will be convenient to consider vertical distribution at the same time as the general mode of life of these animals. *Nautilus* seems to keep near the bottom in the neighbourhood of islands and reefs and has been obtained at a depth of 300 fathoms. It comes into shallow water quite frequently; but Dr. A. Willey believes it breeds in very deep water. The larger Decapoda spend their life swimming at various depths. Some are strictly littoral such as *Sepia* and *Loligo*. Most of the Teuthoidea are pelagic, i.e., they live in the open sea far from land, and some of them have a very considerable vertical distribution. *Chiroteuthis lacertosa* has been taken at a depth of 2,949 fathoms.

In the adult stage the small and fragile Cranchias (*Egopsida consuta*) are to be reckoned as planktonic organisms, i.e., floating more or less at the mercy of currents rather than swimming with or against the latter. The Octopoda mainly dwell on or near the bottom either crawling on the latter or swimming a short distance off it. Some of them, however, e.g., *Eledonella* and *Cirroteuthis*, are not confined to the bottom and are found in mid-water at very considerable depths. Although the large family of the Octopodidae mainly inhabits shallow water, the Octopoda as a whole contain a very large nucleus of deep water forms (one species of

ber of individuals necessarily implies either a sociable instinct or a desire for the protection afforded by a community, as it may be due to the accidental coincidence of large numbers of individuals ("population maximum") in somewhat restricted breeding or feeding grounds. Nevertheless, Verrill has adduced evidence that the shoaling of young *Loligo pealei* off the coast of New England is not thus accidental.

The breeding season has a marked effect on the distribution of certain Cephalopoda. The common cuttlefish (*Sepia officinalis*) comes into shallow water in the spring and summer to breed, and migrations of a similar nature have been observed in other forms (*Loligo*, *Aloteuthis*).

Very little is known concerning the mating habits of the Cephalopoda. It has been assumed that in certain forms with special light organs, e.g., *Sepiolo*, *Loligo*, their organs serve as a means of sexual display. Nevertheless, it is not certainly known that such forms may not mate at depths, which render it likely that such organs function rather as a means of advertising the individual to its prospective partner than as an incitement to coitus. The actual process of coitus has been studied by several naturalists (Racovitza, Drew, Levy, etc.); but, while we know the general lines on which it takes place, the details and particularly those relating to the use of the hectocotylus are not very well known (see Reproductive System). Nor again are we informed as to the bionomic significance of some of the more remarkable cases of sexual dimorphism among these animals, e.g., of the highly elongate and fringed arms of *Sepia bur-nupi* and *lorigera* (Massy, Wülker) and the still more remarkable dimorphism in *Dor-atosepion confusa* (Massy and Robson, Robson and Carleton).

The eggs of most of the Cephalopoda, of which we know the reproductive habits, are laid inshore, and are usually fastened down singly or in clusters on bottom debris such as fragments of coral, stems of plants, etc. Less is known concerning the egg-laying of pelagic species, except in special instances such as that of *Argonauta*, in which a brood chamber is developed in the shape of a shell (not homologous with the true shell) which is secreted by the dorsal arms of the female. Brooding over the eggs seems to take place on the part of the female in certain forms (e.g., *Octopus vulgaris*). Little is known concerning the relations between the sexes apart from those immediately concerned with reproduction. Grimpe, however, records that in captivity *Sepia officinalis* is strictly monogamous though capable of reproduction.

The majority of living Cephalopoda are carnivorous and live principally on Crustacea. Small fishes and other molluscs, however, often form part of their diet and there is some evidence that in nature certain species are cannibals. In the Channel Isles *Octopus vulgaris* partly subsists on the ormer (*Haliotis*) and has been made responsible (though on insufficient evidence) for a marked decrease in the numbers of that mollusc. The Cirrata whose reduced musculature and radula indicate a loss of activity and of masticatory power probably feed on bottom-debris or minute plankton. The latter in the shape of copepods, pteropods, etc., are probably the food of the smaller pelagic Decapoda. The Cephalopoda are in their turn preyed upon by whales, porpoises,

Alcide d'Orbigny in his account of the Mollusca of South America, asserted that the Cephalopoda are in general "sociable," i.e., gregarious, and this statement is certainly true of *Nautilus* which were always found together in droves by the native divers employed by Dr. A. Willey, who observed its habits in New Guinea, etc. Nevertheless, Jatta, who made a special study of the Mediterranean forms, was of the opinion that only certain pelagic forms are thus gregarious (e.g., *Todarodes*, *Ocythoe*). We should avoid concluding that the coincidence of a large num-

dolphins, seals and sea-birds. The stomachs of whales are often found to contain fragments of Cephalopoda (mandibles and sucker-rings), and it is held that the wax-like substance known as ambergris, which is used in perfumery and is found floating at sea or drifted ashore, is composed largely of cephalopod tissue voided by whales. It is not to be doubted that large squids main-

nima. (3) Sasaki has described a very remarkable habit and structural modification in the small cuttlefish *Idiosepius pygmeus*. The latter, which is found in Japanese waters, is often found adhering to sea-weeds by means of a rudimentary sucker developed in the dorsal region of the mantle. No instances of parasitism, and only one doubtful case of commensalism have been recorded among these animals.

Economic Uses.—The Cephalopoda are of considerable value to man, principally as a direct source of food. They also consti-

tute a large part of the diet of certain animals, such as whales and seals, which are of economic importance and in certain parts of the world they are regularly caught on a large scale as bait for certain valuable food-fishes. Squids, cuttlefishes and octopods are eaten by man in many parts of the world. Information concerning the people who regularly eat these animals is by no means complete as yet. The "Anglo-Saxon" people (possibly the Nordic race generally) do not as a rule eat them, even when a regular supply is available. They are largely consumed by south Euro-

pean (Mediterranean) peoples and in India, Indo-China, Malaysia, China, Japan and the Pacific islands. Concerning the littoral natives of Africa and central South America no certain information is available. In the Mediterranean region cephalopods have been eaten since early times. They are at present almost invariably cooked for the table; but in the East, e.g., Indo-China and south India, they are also sun-dried for human consumption. In Japan the squid fishery attains a very great importance and in one year over 70,000,000 kilos of squid were landed (Imperial Japanese Government statistics). *Ommastrephes sloanei* is the chief form taken in these fisheries. The bait fisheries of south India are a very

important local activity and in North America the cod-fishermen rely very largely on various squids for baiting their lines. The only other important material obtained from cephalopods is "cuttle bone" (the internal shell of the *Sepiidae*). The uses of this article are described in the article CUTTLEFISH. Among primitive peoples and in ancient times in Europe various parts of cephalopods have been used in magical operations and in medicine. Cuttle bone has been used as a remedy for leprosy and for various disorders of the heart.

FIG. 26.—SKIN OF WHALE SCARRED BY THE SUCKERS OF ARCHITEUTHIS. Note the marks of the sucker-teeth on the circumference of each ring

may be dated from Cuvier who gave them the name by which they are now known. H. de Blainville (1777-1850) and Alcide d'Orbigny (1802-57) laid the foundation of the systematic study of the group, the great monograph *Mémoire sur les Céphalopodes Acétabulifères* of d'Orbigny being a landmark in systematic zoology. This work includes descriptions of fossil forms as well as of living species. R. Owen contributed substantially to our knowledge of the morphology of the class, particularly by his *Memoir on the Pearly Nautilus* (1832). A. Kölliker may be said to have founded the embryological study of cephalopods (1843) and Alpheus Hyatt (1868)

tain a desperate struggle with any whale that may attack them, as specimens of the latter are sometimes taken with the marks of sucker-rings imprinted in their skin.

The colour-changes produced in the skin of most cephalopods by the contraction and expansion of the chromatophores have been variously interpreted as affording protective or obliterative colouration or as an expression of certain emotions. It is likely that both these effects are secured by this means. The common octopus has been observed to assume a very close mimetic resemblance to the colour of its background. On the other hand the present author has made observations on colour changes in *Sepiolo atlantica* which are the reverse of protective, as judged by the human eye. The chief means of avoiding capture is, however, provided by the "ink" which is expelled from the ink-sac when the animal is attacked. It was originally thought that the ink formed a kind of "smoke-screen" behind or in which the animal was hidden from its enemy. Recent observations, however, tend to suggest that the jet of ink, when shot out, remains as a definitely shaped object in the water and serves as a "dummy" to engage the attention of the enemy, while the cephalopod changing its colour, so that it is almost transparent, darts off in another direction. Whether this explanation is applicable to all cases is uncertain; and in any case it is uncertain why, if many cephalopods can assume something approaching protective transparency, it should be necessary to add to the means of concealment. The matter is plainly in need of further investigation. The Cephalopoda as a whole are not distinguished by individual eccentricities of behaviour. It is worth while, however, to mention three interesting cases. (1) Many pelagic squids and cuttles keep very near the surface when swimming, and one of them, "the flying squid," *Ommastrephes bartrami*, often shoots out of the water in rough weather and has been several times carried by its leaps on to the decks of ships. (2) The male of the pelagic octopod *Ocythoe* is often found inhabiting the discarded test of the Tunicate *Salpa*, a habit in which it resembles the Crustacean *Phro-*

led the way in early palaeontological studies of these animals. The rarer pelagic and deep sea forms were only obtained slowly and, although the Cirrata were known as early as 1836 (Eschricht), it was not until towards the end of the last century that the "Challenger" expedition and the researches of W. Hoyle and A. E. Verrill obtained the first substantial contribution to our knowledge of these forms. Since then, C. Chun, I. Steenstrup, A. Appelb, G. Pfeffer, L. Joubin, A. Naef, S. S. Berry, G. Grimpe, M. Sasaki and A. Massy have contributed to our knowledge of the living forms, while L. Branco, J. Foord and G. C. Crick, S. Buckman and R. Abel have organized the study of fossil forms. Particular mention must be made of the work of Naef, who in recent years has subjected the living and fossil forms to a synthetic treatment. Apart from our lack of information concerning the development of *Nautilus* there still remains much work to be done, particularly on the habits and ecological relationships of these animals, and it is to be doubted whether we are yet in possession of a sound systematic arrangement of the Decapoda.

CEPHEUS, in Greek mythology, the father of Andromeda (q.v.); in astronomy, a constellation of the northern hemisphere. The star δ Cephei is the type star of a class of variables called Cepheids (see STAR). It was discovered by Goodricke in 1785. The period is 5.37 days and the range of magnitude is from 3.6 to 4.2. The star β Cephei is also a famous Cepheid variable; although its range of brightness is only 0.05 mag. its variability was detected by Professor Paul Guthnick of Berlin University by photoelectric measurements.

CEPHISODOTUS, the name of a near relative, and of the son of Praxiteles, both sculptors like himself. The former must have flourished about 400 B.C. A noted work of his was Peace bearing the infant Wealth, of which a copy exists at Munich. Peace is a Madonna-like figure of a somewhat conservative type. He made certain statues for the city of Megalopolis, founded in 370 B.C. (See H. Stuart Jones, *Ancient Writers on Greek Sculpture* § 182–185 [1895].) Of the work of the younger Cephisodotus we have no remains; he flourished in the latter part of the 4th century B.C., and was noted for portraits of Menander, of the orator Lycurgus, and others. (See J. Overbeck, *Antike Schriftquellen*, p. 255.)

FIG. 27.—PYGMY CUTTLEFISH (*IDIOSEPIUS PYGMAEUS*) ADHERING TO A FROND OF *ULVA*

CERAM, an island of the Dutch East Indies, in the Molucca group. It lies 3° S. and between 127° 45' and 151° E., and is due east of Buru, from which it is divided by the Manipa or Buru strait, in which are the islands of Manipa, Kelang and Boano. It is 216m. long, and has an area, with adjacent islands, of 6,621 square miles. Politically, it comes under the residency of Amboina, and for administrative purposes is divided into four districts—West Ceram, Amahai and Wahai (Middle Ceram) and East Ceram, with a *controleur* and three *gezaghebbbers*. The island, which, geologically, is composed mostly of eruptive rocks and crystalline limestone in the middle and western portions, and of crystalline chalk in the east, is very mountainous, a fine range of mountains traversing it from east to west, and nearer to the north coast. The highest peak is that of Nusaheli (9,612ft.), and four others exceed 6,000 feet. In some places the mountains extend right to the coast; in others wide stretches of lowland are sometimes fringed with swamps by the sea-shore. There are many rivers, running to the north mostly, and of these the chief are the Ruata, Bobot and Saputana. They are partly navigable for small craft only during the rainy season, and often dry up altogether during the period of drought. Comparatively little is known of the interior of the island, with the exception of the peninsula of Huammal in the west, which is connected with the main island by a low, narrow isthmus. With Ceram are included Ceram Laut, a cluster of islands on a coral reef, about 20m. long, also Gisser and Kilwaru, the Goram islands (Suruaki, Goram and Manavoka), the Matabela group, and the Teor isles, all of which lie south-east of Ceram.

The larger islands are of Tertiary (Miocene) formation, and the others of recent coral. None has hills of over 1,000ft. and most are thickly wooded, whilst Suruaki has extensive swamps. Many of the Matabela islands have rugged hills, covered with coconut palms, and some of the Teor group are entirely waterless, owing to the previous nature of their coral rock.

Ceram is covered with dense tropical forests, which provide excellent timber (ironwood is general), and yield a variety of forest products, including cajeput oil, damar and wild nutmeg, and in the swamps of the coast and valleys the sago palm thrives abundantly. Both the flora and the fauna of the island lack variety and characteristic specimens; of a forest in the centre A. R. Wallace wrote: "I have never been in a forest so utterly desert of animal life as this appeared to be." The cassowary is the outstanding feature of the fauna, which includes deer, cuscus, pig, shrews, cockatoos, lorries, hornbills and birds of paradise, and there are many species of fish in the rivers. The climate is hot and moist, the rainfall being a heavy one, and earthquakes occur. Ceram, together with the islands of Boano and Manipa, has a population of 82,546. It is largely coastal, composed mostly of immigrants from Java, Macassar, Ternate and other parts of the archipelago, and is mixed Malay in character, partly Christian and partly Mohammedan. The Christians live mainly in the west (the Mohammedans in the south-east) and dress and live in the style of the Christian Amboinese, to whom they are nearly related. Fishing and agriculture are the chief pursuits. Most of the tropical fruits of Malaya are grown, also rice, maize, sugar-cane, tobacco and coconuts; sago flour is produced and cajeput oil distilled. Trade in these products is in the hands of Chinese, Arabs and Macassars, but there are several large coconut, spice and other plantations under European supervision and copra is the chief article of export. The people of the coasts are semi-civilized; not so those of the interior, who are of a mixed Malay-Papuan stock (with a marked difference between eastern and western tribes), and retain many savage characteristics, although the practice of head-hunting is becoming a thing of the past. They are largely pagan in religion, wear little in the way of clothing, live in houses built on piles, and use as weapons the bow and arrow, *parang* and lance. They are hunters and fishers, and collect forest products, keep pigs and dogs, have a patriarchal social system and a form of marriage sometimes endogamic, sometimes exogamic. Women have a good position amongst them, and are well treated, and, especially among the mountain folk, morality is high. Industry is at a low level. Weaving is known in some parts, and weapons and

plaited goods are manufactured. China plates and dishes are considered objects of the highest value, and the people like long ceremonial feasts. There is a secret society among the people of the west, the *Kakihan*, the main object seeming to be maintenance of old customs in the face of foreign influence but which has also a strong religious significance, initiation being a form of death and resurrection ritual; and the people generally are divided into the two divisions of *Pata-siwa* (the Ternate party), and *Patalima* (the Tidore party). The Ceramese are a strong and muscular people, cheerful and honest, but inclined to be very excitable, and extremely independent. The natives of the middle and east are far more peaceful in their ways than those of the west, but civilization is making headway amongst all, as the result of increasing trade facilities and the provision of schools in many districts, maintained by the Dutch Government, with Amboinese headmasters. Amahai, in the south (centre), has a good harbour, and this, and Piru (west), Wahai (north), Tehoru (south), and Bula Bay (east), are ports of call for vessels of the Royal Packet Navigation Co.: roads are non-existent. Ceramese, a language without either script or literature (yet the people sing songs of former ages which have been handed down orally), is divided into thirty-five different dialects, and is nearly related to the indigenous language of Amboina. Malay is used commonly on the coasts. The people of the Ceram Laut islands (pop. 6,000), Gisser and Kilwaru are Mohammedan. They are fishers, build boats, weave sarongs, manufacture knives and live in quite well-built wooden houses, in tidy villages, generally by the sea-shore. Gisser, with Kilwaru, is a trade-centre for the region of south-eastern Ceram and the islands, and is a port of call for vessels of the Royal Packet Navigation Co. The population of the Goram islands, which are more fertile than those of Ceram Laut, is also about 6,000, and Mohammedan, the people being fishers and traders and the women good weavers. The Matabela islanders are Mohammedan also; they produce scarcely anything beyond copra, which they trade for the products they lack. Boano has a population of 1,300, Christian and Mohammedan, and an infertile soil, which drives its people to seek a livelihood on neighbouring islands, and Manipa has nearly 1,000 inhabitants who grow a good deal of sago.

In the mid-17th century a fort established at Cambello extended Dutch influence, with help from Ternate, which claimed suzerainty. The power of Amboina later helped the Dutch to acquire the whole island in spite of trouble when they destroyed clove plantations in order to uphold Amboina's monopoly. Later still, there were expeditions against the natives of the interior, but since 1910 all has been quiet and the Wahai garrison was withdrawn in 1914.

BIBLIOGRAPHY.—A. R. Wallace, *The Malay Archipelago* (1890). (E. E. L.)

CERAMICS or **KERAMICS**, a general term for the history and art of making pottery. (See **POTTERIES** AND **PORCELAINS**.)

CERARGYRITE, the name usually applied by mineralogists to naturally-occurring silver chloride, though sometimes taken to include the bromide and iodide as well, or mixtures of them. It crystallizes rarely in the cubic system, but usually forms horn-like masses, known to miners as horn-silver. It is very soft, being easily cut with a knife, and usually of a dirty grey or yellowish colour. It is an important ore of silver, occurring in considerable quantity in the oxidation zone of silver lodes in dry climates, such as Chile, Peru, and Broken Hill in New South Wales, where the surface waters are rich in chlorides, bromides and iodides.

(R. H. RA.)

CERATOSAURUS, an extinct carnivorous Dinosaur whose remains are found in the Upper Jurassic of Colorado. Like its relatives the *Allosaurus* and *Tyrannosaurus* (*qq.v.*), it was bipedal in progression. The single species, *C. nasicornis*, reached a length of 20 ft. and, as its name implies, was distinguished by a small horn on the nose. (See **REPTILE**.)

CERBERUS, in Greek mythology, the dog who guarded the entrance to the lower world. According to Hesiod (*Theog.*, 311), he was a 50-headed monster, the offspring of Typhon and Echidna. He was variously represented with one, two, or (usually) three

heads, often with the tail of a snake or with snakes growing from his head or twined round his body. One of the tasks imposed upon Heracles was to fetch Cerberus from below to the upper world, a favourite subject of ancient vase paintings.

CERDIC (d. 534), founder of the West Saxon kingdom, is described as an ealdorman who in 495 landed with his son Cynric in Hampshire, where he was attacked at once by the Britons, under Natanleod. Nothing more is heard of him until 508, when he defeated the Britons with great slaughter. Strengthened by fresh arrivals of Saxons, he gained another victory in 519 at Certicesford, the modern Charford, and in this year took the title of king. Turning westward, Cerdic appears to have been defeated by the Britons in 520 at Badbury or Mount Badon, in Dorset, and in 527 yet another fight with the Britons is recorded. His last work was the conquest of the Isle of Wight (530), probably in the interest of some Jutish allies.

See E. Guest, *Origines Celticae* (1883); Bede, *Historiae ecclesiasticae gentis Anglorum libri*, v., ed. C. Plummer (Oxford, 1896); Gildas, *De excidio Britanniae*, ed. Th. Mommsen (1898); Nennius, *Historia Brittonum*, ed. Th. Mommsen (1898); *Anglo-Saxon Chronicle*, edited by C. Plummer (Oxford, 1892-99).

CERDONIANS, a Gnostic sect, founded by Cerdo, a Syrian, who came to Rome about 137, but concerning whose history little is known. Most of what the Fathers narrate of Cerdo's tenets has probably been transferred to him from his famous pupil Marcion, like whom he is said to have rejected the Old Testament and the New, except part of Luke's Gospel and of Paul's Epistles. (See **MARCION** AND **THE MARCIONITE CHURCHES**; also **GNOSTICISM**.)

CEREALIS (**CERIALIS**), **PETILLIUS** (1st century A.D.), Roman general, a relative of the Emperor Vespasian. In A.D. 61 he was in Britain as legate of the ninth legion, which was overwhelmed by the Britons. In the civil war of 69 he supported Vespasian, and in 70, after holding the consulship, he put down the revolt of Civilis (*q.v.*). In 71, as governor of Britain, where he had as a subordinate the famous Agricola, he defeated the powerful Brigantes. Tacitus says that he was a bold soldier rather than a careful general.

See Tacitus, *Annals*, xiv. 32; *Histories*, iii. 59, 78, iv. 71, 75, 86, v. 21; *Agricola*, 8, 17. See also B. Henderson, *Civil War and Rebellion in the Roman Empire* (1908).

CEREALS. Barley and wheat are the only two grain foods that philologically deserve the name cereal. Oats, maize, rye and perhaps rice were discovered, or at least took an important place, after the word cereal was coined. It derives from the very picturesque ceremonies, the *Cerealia*, by which the Romans celebrated the festival of Ceres, the goddess of corn. All the cereals have historic value. They have been one of the most potent influences in building civilizations at different dates in different parts of the world. Rice, much the least nutritious of all, is still the staple food of the crowded populations of India and Eastern Asia. The maize crop of the United States exceeds the aggregate of all the other grains and is pre-eminent in South America. There would be less cultivation and a much smaller population over wide districts of Siberia and Northern Europe, but for the discovery of rye, a native plant of Russia; and oats, essentially the crop of the north, has long been the standard crop of northern farms of Europe and America. Scotland is a characteristic oat-growing country.

In the long run cultivators discover what crops best suit their own soil and climate. Rye will grow under conditions of drought and heat and poverty of soil that would prohibit the cultivation of any other cereal. It has the virtue of possessing a very tough straw, much used for the protective mats used by the intensive cultivators of vegetables. Though rice is the poorest of all cereals in feeding value and is troublesome to cultivate, it is grown over large tracts, because it flourishes under conditions of moisture that would not suit any other cereal. It would be impossible to convert many of the "paddy" fields of India into wheat fields, except by the help of costly draining schemes. Barley and oats will both flourish at a latitude too far north for wheat.

It can scarcely be doubted that the earliest civilizations in Mesopotamia and Egypt were largely created by the exploitation of barley and wheat, food plants that put an end to the nomadic

form of life, and, by the provision of a certain and highly yielding food, gave more leisure for the development of the graces of life.

The Aristocrat of Grasses.—In the history of the cereal crops the outstanding fact is the slow but progressive dominance of wheat which is often known in Britain, though not in America, as corn. Wheat is the cereal of cereals; and it is so considered even where rice and maize are the standard crops. It is not the oldest cereal; nor the richest in nutriment nor the easiest to grow. All recent evidence goes to prove that barley preceded it. We know that both barley and millet were staple foods in Egypt in 6000 B.C., and it is more than probable that wheat was not so highly esteemed at that early period.

Barley then was the earliest grain. It was succeeded by spelt or emmer, from which was developed or selected the true wheat of our days (*Triticum sativum*). The eminence of wheat has been chiefly due to the more palatable attributes of the flour; but it possesses all the qualities that have fostered each species of cereals. It gives a large yield. It is an annual, germinating and maturing very quickly, it can, to a great extent, dominate weeds and above all the garnered grain can be kept for long periods without apparent loss of virtue. An excellent example of another quality of wheat, in comparison with other cereals, was supplied during the World War. A great number of American townships abjured the use of wheat altogether, at the urgency of their Department of Agriculture, in order that it might be shipped to their European allies. The reason for shipping wheat and not maize was that the grain travelled without danger of heating or any degeneration.

The progress of wheat, in spite of some setbacks, still proceeds. Its superiority over rice as a food is slowly becoming an accepted fact in China; and if this preference grows it may exercise a considerable influence on social development by restoring cereal cultivation where it is being surrendered and developing a different form of agriculture both in Asia and Australia. All the cereals are of one botanical family. They are gramineous, like other plants of peculiar importance to humanity, the cane-sugar and the bamboo. Even cereals, usually harvested for their dried grain, are occasionally used as green fodder. The stalk and leaves of the maize are "clamped" and fed to stock here and there, even in southern England. Some few Australian farmers find the cutting of wheat in the green state the most lucrative form of harvesting; and the growing of an admixture of oats with rye or other grasses and clovers is a common and a growing practice.

In discussions on the extent and influence of cereals and in text books on agriculture insufficient importance is usually given to that form of millet (a word very loosely used) which is known botanically as sorghum, a plant that bears a close likeness to maize or Indian corn or "mealies." It takes the place of oats and barley over a great part of Asia Minor, is the staple crop in parts of tropical Africa and has extended its range both in Europe and Australia. Some of the Australian farmers in the north of New South Wales grow it for the stem and stalk, out of which domestic brooms are manufactured.

Historically Egypt and Babylonia are the best examples known to us of the influence of cereals on civilization. A contrary example may be found in Australia. Though one species of millet is native to Queensland—some say—and rice is a native wild plant, the older black inhabitants never learnt agriculture and therefore remained nomad. Then owing to the difficulty of finding food they were often forced to keep their population small by artificial methods rigorously enforced by tribal laws.

The belief that the earliest civilizations were founded on cereal growing is supported by myth as well as history. Recent evidence is held to indicate that Egypt was the home of a rather earlier civilization than Mesopotamia; and a favourite Egyptian tale corroborates the view. Tradition says that Isis, the wife of Osiris, discovered barley (or one of the cereal grains) and her husband "eager to communicate these beneficent discoveries . . . travelled over the world diffusing the blessings of civilization wherever he went." It is remarkable that he is said to have taught specifically the brewing of beer from barley. (W. B. T.)

CEREALS IN DIET

Wheat is the most important cereal and supplies the best flour for bread and pastry-making; it also furnishes semolina (see FLOUR; BREAD; PASTRY; SEMOLINA). Rye though widely used in Russia, Germany and France for bread-making (pumpernickel) is less suitable for flour (see RYE). It is, however, widely used in this form in Germany, Russia and the United States.

Oats, barley, rice and maize are prepared as meal (see PORRIDGE); or, the grain is hulled (pearl barley) and sometimes polished (rice); or, it may be "rolled," i.e., flattened by applied heat in order to facilitate the cooking process. Corn-flour or corn-starch and blancmange powders are specially manufactured from very finely ground maize. Buckwheat furnishes a flour which is much used for making griddle cakes. Some other farinaceous foods are sago, tapioca and arrowroot used as thickening for soups and for puddings, etc., although they are prepared from the roots of tropical plants and are from a very different family. Potatoes, chestnuts and bananas are also prepared in meal form.

General Rules for Cooking.—All grains and farinaceous foods require the addition of liquid (milk, water or stock) in order to swell the starch grains, which are indigestible unless thoroughly cooked. During expansion, grains absorb much liquid, e.g., rice absorbs five times its own weight. Hence steaming it in a double pan is better than boiling it. Large whole grains, e.g., pearl barley, require 2 to 3 hr. cooking unless previously soaked in cold water for 6 hours. Seed preparations, such as sago, tapioca, etc., should be sprinkled into boiling liquid and cooked until transparent. Flaked cereals need less cooking and water than other preparations as they are already partially cooked and a certain amount of water has been absorbed in steaming (see PORRIDGE). Salt (1 teaspoonful to 1 lb. grain) should be added to cereals, even when sugar is also an ingredient, to make good the deficiency of mineral matter lost in shedding the husk of the grain.

Baked puddings composed of cereals or other farinaceous foods and milk require slow cooking because milk evaporates. Where skim milk is used, fat should be added, also in the case of foods deficient in fat, e.g., sago, tapioca, rice. Allow 2 oz. of starchy food or grain to each pint of milk. Do not break the skin which forms on milk puddings as this retains the steam and prevents loss by evaporation. For plain blancmanges allow 1½ oz. of starchy food to a pint of milk; where water is used, as in cereal jellies, more starchy food is needed. Stir until the mixture thickens. For thickening sauces use 1 teaspoonful of starch to ½ pint of liquid.

Cereal foods may be combined with eggs, cheese, preserves, vegetables, meat and fish. Various dishes are made with "mushes" i.e., meals previously cooked and flavoured, bound with eggs or other liaison and fried in the form of cutlets or cakes.

Chocolate Jelly.—Take one pint of milk, 1½ oz. of arrowroot, 1½ oz. of grated chocolate and the whipped whites of 2 eggs. Mix the chocolate and arrowroot with a little of the milk and boil the remainder with ½ oz. of castor sugar; when boiling, pour on to the arrowroot and cook for 3 minutes. Cool slightly, mix in the whites of eggs and turn into a wet mould. Serve when cold.

Sago Mould.—Boil 1½ pints of water with 2 teaspoonfuls of damson cheese and 1½ oz. of castor sugar. When boiling sprinkle in 3 oz. of seed sago. Stir until the sago is clear. Set in a wet mould. Turn out when cold and serve with whipped cream.

Baked Bread and Rice.—Wash and steep 4 oz. of rice in ½ pint of boiling milk. Soak about 2 oz. of breadcrumbs in one gill of cold milk. Into the latter beat 2 eggs, add sugar and grated nutmeg. When well mixed add to the steeped rice. Place in a greased pie-dish with small pieces of suet on the top. Bake in a slow oven.

Oatcakes.—For Scotch oatcakes allow 1 pint of boiling water to each pound of medium oatmeal, and ½ oz. of salted butter. Mix the oatmeal and salted butter together and pour the boiling water on to the oatmeal making a well in the centre for mixing. Roll out as quickly as possible on a board which has been sprinkled with fine oatmeal. Cut into triangular portions of ½ in. thickness.

Bake on a floured griddle until stiff and slightly coloured. Dry off before the fire. Store in a tin and when required toast gently. Eat with butter. (J. A. St.)

In the United States.—The general composition of the cereal grains is much the same. If the whole grains are used there need be little concern as to which are chosen from the nutritive angle, as most of the mineral and vitamin content of the cereal grains is found in the outer coating. When cereals are refined this content is largely lost unless it is salvaged through the consumption of bran. While this mineral content should not be underestimated the most important function of cereals is to furnish the body at a low cost with heat and energy. They form an inexpensive, easily digested foundation upon which to build health with other more expensive foods to supply flavour and other nutritive essentials beside calories. When a diet must be limited in cost the whole grain should be particularly sought. In a varied diet which contains plenty of milk, fruits, vegetables and eggs it probably makes little difference whether one eats white bread, whole wheat or whole or refined breakfast cereals. The general composition of cereal grains is: water, 10 to 12%; proteins, 10 to 12%; carbohydrates, 65 to 75%; mineral matter, 2%; fat, 0.5% to 8%. Cereals contain a valuable amount of protein although they are not usually classed among the protein foods.

Rice has the greatest consumption of any of the cereals although it has its largest use in the Orient. Wheat has the widest use of any cereal in the Western world. Barley, rye, oats and buckwheat are used in quantity. All of these cereals are made into some sort of flour and all of them except buckwheat are made into porridge, or into the modern "toasted," ready-to-eat breakfast foods. Of the cereal grains corn is the only one that is used in its fresh form as a vegetable. All cereals need to be cooked thoroughly to soften the fibre and to make them palatable. Many of the porridge cereals such as oatmeal are now steam-cooked in the factories and therefore need but a short cooking in the kitchen.

Rules for Cooking Cereals.—The water must be boiling. Use $1\frac{1}{2}$ teaspoons salt to 1 cup of cereal. Add the cereal, which has been looked over, and salt to water, so slowly that it does not stop boiling. Boil at least 5 minutes. Unless previously steam-cooked at factory, cook in a double boiler or a fireless cooker for several hours.

Table for Cooking Cereals

| | Quantity | Water | Salt | Time |
|-------------------------------|----------|----------------|----------------|--------------------|
| | Cups | Cups | Teaspoons | |
| Corn-meal . . . | 1 | 5 | $1\frac{1}{2}$ | 3 to 5 hr. |
| Hominy (fine) . . | 1 | 4 | $1\frac{1}{2}$ | $1\frac{1}{2}$ hr. |
| Rice (boiled) . . | 1 | 8 | $1\frac{1}{2}$ | 20 min. |
| Rice (steamed) . . | 1 | 3 | $1\frac{1}{2}$ | 1 hr. |
| Rolled oats . . . | 1 | $2\frac{1}{2}$ | $1\frac{1}{2}$ | 1 " |
| Scotch or Irish oatmeal . . . | 1 | 4 | $1\frac{1}{2}$ | 8 " |
| Wheat preparations | 1 | 4 | $1\frac{1}{2}$ | 1 " |

When starches such as flour, corn-starch or arrowroot are used for thickening purposes the starch grains must be thoroughly mixed with a small amount of cold liquid or hot fat before being mixed with the other ingredients for sauces or puddings. White sauce (*q.v.*) is one example of the hot fat method, corn-starch pudding is an example of the cold liquid method.

Corn-starch Pudding

3 cups milk
2 egg whites
 $\frac{1}{2}$ cup sugar

$\frac{1}{2}$ cup corn-starch
 $\frac{1}{2}$ teaspoon salt
1 teaspoon vanilla

Mix the corn-starch, salt and sugar with enough cold milk to make a smooth paste. Scald the rest of the milk in a double boiler, and when it is hot stir in the corn-starch mixture. Stir until smooth and thick. Cover and cook 30 min. in double boiler. Remove from the fire, add the beaten eggs, and the vanilla. Pour into a mold and chill. When set turn out on a large plate, garnish with cherries and candied orange or grapefruit peel and serve with a chocolate sauce or whipped cream.

A chocolate pudding may be prepared by adding before the

eggs, two squares of chocolate cooked until smooth with $\frac{1}{4}$ cup of cold water. The eggs may be omitted. A fruit pudding may be prepared by using 1 cup of cut dates, raisins, prunes or mixed fruit. A caramel pudding may be prepared by using $\frac{3}{4}$ cup of brown sugar, instead of granulated sugar. One cup of dried fruit may be added.

Rice Pudding

4 cups milk
 $\frac{1}{2}$ cup rice

nutmeg

$\frac{1}{2}$ teaspoon salt
 $\frac{1}{2}$ cup sugar

Wash the rice, mix it with the other ingredients and pour the mixture into a buttered pudding dish. Bake for two hours in a slow oven (250° F) stirring it three times during the first hour to prevent sticking. Raisins or cut dates may be added or $\frac{1}{2}$ cup of strong coffee diminishing amount of milk. Serve either very hot or very cold with whipped cream, hard sauce, fruits with syrup or caramel sauce.

Indian Pudding

5 cups scalded milk
 $\frac{1}{2}$ cup corn-meal
 $\frac{1}{2}$ cup molasses

1 teaspoon salt
 $\frac{1}{2}$ teaspoon nutmeg
 $\frac{1}{2}$ teaspoon ginger

Pour milk slowly on meal, cook in double boiler twenty minutes, add molasses, salt, nutmeg and ginger. Pour into buttered pudding-dish and bake two hours in slow oven (250° F). Serve with cream or with a fruit sauce. (E. M. B.)

CEREBELLUM: *see* BRAIN; also EQUILIBRIUM, ANIMAL.

CEREMONIAL. In the military sense the prescribed drill and formations for certain specific occasions such as parades, reviews, guard duty, funerals, trooping the colours and lining streets, as distinct from drill applicable to field exercises.

CERES, goddess of the growth of food-plants, worshipped, alone or with the god Ceres, over a considerable part of Italy. (Oscan *Keri*—; probably connected with *cre-are*, *cre-sco*;[?] "creatress"). Her cult was early overlaid by that of Demeter, who was widely worshipped in Sicily and Magna Graecia, *cf.* DEMETER. On the advice of the Sibylline Books, a cult of Ceres Liber and Libera was introduced into Rome in 496 B.C., to check a famine. Liber and Libera seem to represent the *Iakchos* and *Kore* of the Eleusinian cult. The ritual of this worship was largely if not wholly Greek. The temple, which was built on the Aventine in 493 B.C., and was of Etruscan shape, but decorated by Greek artists, became a centre of plebeian activities, religious and political. Ceres was regarded as the patroness of the corn-trade, which seems to have been early in plebeian hands. The chief festivals of this cult were: (1) *Ludi Ceriales*, introduced before 202 B.C., and ultimately lasting from April 12–19; (2) An annual festival, instituted before 217 B.C., celebrated in secret by the women and apparently dealing with the union of *Kore* and *Hades*; (3) From 191 B.C. on a fast (*ieiunium Cereris*), held every five years, but later every year on Oct. 4. All these are on Greek lines.

See Wissowa, *Religion und Kultus* (2nd ed.), pp. 192 *et seq.*, 297 *et seq.*

CERIGNOLA, a town of Apulia, Italy, in the province of Foggia, 26m. S.E. by rail from the town of Foggia. Pop. (1921), 36,017 (town); 38,591 (commune). It was rebuilt after a great earthquake in 1731. It has a considerable agricultural trade and also trade in merino and mattress-wool. In 1503 the Spaniards under Gonzalo de Cordoba defeated the French under the duc de Nemours below the town—a victory which made the kingdom of Naples into a Spanish province in Italy. Cerignola lies on the Via Traiana between Herdoniae and Canusium.

CERIGOTTO, called locally Lius (anc. *Aegilia* or *Ogylos*; mod. official Gr. *Antikythera*), an island of Greece, between Cythera (Cerigo) and Crete, about 20 m. from each. The inhabitants are mainly Cretan refugees, and in favourable seasons export wheat. It was long a resort of pirates. Close to its coast in 1900 an ancient ship was discovered, laden with bronze and marble statues.

CERINTHUS (c. A.D. 100), a Christian heretic, known to St. John. Hippolytus (*Haer.* vii. 33) credits him with an Egyptian training, but there can be no truth in the notice given by Epiphanius (*Haer.* xxviii. 4) that Cerinthus had led the judaizing opposition against Paul at Jerusalem.

According to Irenaeus (*Adv. haeres.* I. 26 1), Cerinthus taught that the world had been made by angels, from one of whom the god of the Jews, the Israelites had received this imperfect law. The only New Testament writing which he accepted was a mutilated Gospel of Matthew. Jesus was the offspring of Joseph and Mary, and on Him at the baptism descended the Christ, the divine power, revealing the unknown Father, and endowing Him with miraculous power. This Christ left Jesus before the Passion and the resurrection. According to Philastrius and St. Epiphanius, Cerinthus admitted circumcision and the observance of the Sabbath. Gaius, the priest (c. 290) and Dionysius of Alexandria (c. 340) accused him of a crude form of Chiliasm. Cerinthus is a blend of judaizing Christian and Gnostic.

CERIUM, the commonest metallic element belonging to the rare earth group, discovered in 1803 by Klaproth and independently by Berzelius and Hisinger. Cerium (symbol Ce, atomic number 58, atomic weight 140.2) occurs most abundantly in the minerals monazite, cerite and allanite, accompanied by the other members of the group. It is formed by electrolysis of fused anhydrous chloride. It is of an iron-grey colour, about as soft as lead, and is attacked slowly by cold water and more rapidly by hot water. It melts at 623°C. It burns brilliantly when heated in the form of wire, and is a powerful reducing agent. It forms alloys with other metals, the best known being that with iron which is used because of its well-known property of giving off showers of brilliant sparks when struck or filed. Of all the rare earths it is most easily purified. This is due to the fact that it is the only one that forms a higher series of compounds (CeX_4). These compounds readily suffer hydrolysis with the precipitation of basic substances practically free from other earths. The purification is readily brought about by carefully boiling the mixed nitrates with potassium bromate and then gradually adding coarsely ground marble to keep down the acidity. The precipitated basic nitrate is washed with a 1% solution of nitric acid. The product may be purified if necessary by repeating the process.

The common oxide, produced when the salts of cerium with volatile acids are heated, is the dioxide CeO_2 . This oxide, which is a pale-yellowish powder, is insoluble in nitric and hydrochloric acids, but soluble in sulphuric acid. The salts corresponding to this oxide are of the type $\text{Ce}(\text{SO}_4)_2$ and possess a yellow or orange-red colour. The salts derived from trivalent cerium [type $\text{Ce}_2(\text{SO}_4)_3$] are much more stable, colourless and show no absorption spectrum. Cerium compounds have a few uses. The oxalate is used to prevent various forms of sickness such as sea-sickness, etc. Cerium nitrate is used in the manufacture of Welsbach mantles, in the ceramic and textile industries, etc. (*See RARE EARTHS.*) (C. J.)

CERNUSCHI, HENRI (1821–1896), Italian politician and economist, was born at Milan. He played a part in the revolutionary movement and was compelled to leave Italy in 1850. He then settled in France, where he made a large fortune. Cernuschi is best known as an ardent champion of bimetalism, and the word itself is commonly supposed to have originated with him—at least in its English form it is first found in his *Silver Vindicated* (1876).

Among his other works may be mentioned *Mécanique de l'échange* (1861); *Le Bimétallisme en Angleterre* (1879); *Le Grand Procès de l'Union latine* (1884); *Illusion des sociétés coopératives* (1886).

CEROGRAPHY, the art of painting in wax; from the Gr. *κηρός*, wax, and *γράφειν*, to write. (*See ENCAUSTIC PAINTING.*)

CERRO DE PASCO, a mining town of Peru, capital of the department of Junín, 76° 16' W., 10° 43' S., 221 m. N.E. of Lima by rail, *via* Oroya. Pop. (1926 est.) 20,000, altitude 14,167 feet. In the midst of a cold, desolate region without tree or shrub, Cerro de Pasco has been famed in history as one of the richest silver mining districts in Peru, second only to Potosí. Silver, copper, gold and lead are found in many forms. The town is riddled with tunnels and entrances to ancient mines with attendant piles of debris. The adobe houses and rough streets are unevenly arranged, and thick smoke and evil smells contaminate an otherwise healthy, though harsh, climate. Strangers are apt to suffer from *soroche*, a disease caused by the rarefied atmosphere. The inhabitants are mostly Indian labourers and their families. There

are a few modern buildings such as hotels, clubs and commercial houses. Previous to 1898 when extraction of copper began, only silver was mined here. In 1906 the Cerro de Pasco Mining Co., founded in the United States, began to export copper. It is now the largest producer and has built a railway from Cerro de Pasco to Oroya (83 m.) connecting there with the State railway to Lima and Callao, and another forked branch (25 m.) from Cerro de Pasco to the bituminous coal mines of Gollarisquisga and Quishuarcancha, whose entire output is used by the company. It owns smelters, including one of 3,000 tons at Oroya, a 12,000 h.p. hydro-electric plant, and is altogether one of the most complete mining establishments in the world. In 1927 its output was 45,000 tons copper, 12,500,000 oz. silver and 26,500 oz. gold. The production of lead bullion by the Cerro de Pasco Co. now averages 50 tons a day. (M. T. Br.)

CERRO GORDO, a mountain pass, 60 m. N.W. of Vera Cruz, along the National highway from the coast to the capital of Mexico. At this place, Maj.-Gen. Winfield Scott, in his advance from the gulf to Mexico City during the war between the United States and Mexico (1846–48), met his first stout resistance. The leading column commanded by Brig.-Gen. D. E. Twiggs had been stopped by fire from the frowning cliffs of Cerro Gordo (April 12, 1847). When Scott arrived upon the scene (April 14), he immediately ordered certain officers, among them Capt. Robert E. Lee, to make definite reconnaissances. Learning from these the dispositions of the enemy and knowing that there was but one highway westward, he formulated a plan for a wide turning movement in order to gain and attack the Mexican rear. Twiggs' division was to occupy La Atalaya, a prominent hill in front, without bringing on a general engagement. There he was to wait until Brig.-Gen. James Shields' brigade should complete a long detour, when a simultaneous attack would be delivered. Brig.-Gen. G. J. Pillow's brigade was to oppose the batteries immediately in front. Scott's whole force numbered about 8,500 as against 12,000 to 18,000 Mexicans under Gen. Santa Anna. Twiggs' movement on April 17 upon La Atalaya was so impetuous as to bring on a premature assault upon El Telégrafo, the commanding position beyond. Although La Atalaya was taken as planned, the small group of Americans attacking El Telégrafo was repulsed. Before dark and the ensuing rain, Shields arrived in support of Twiggs. The next morning, April 18, the attack upon El Telégrafo being renewed, Col. W. S. Harney's troops, after a rugged climb under fire, took the crest by a gallant onslaught. Shortly thereafter Shields' appearance in the open at the Mexican left hastened Santa Anna's flight, already begun. Some 40 cannon, 40,000 muskets and at least 5,000 prisoners were captured by Scott. The Mexican casualties have been estimated at about 1,100, whereas the American loss is given as 64 killed and 353 wounded.

Ganoe, *The History of the United States Army* (1924); *Original Correspondence and Reports in Old Files Section*, adjutant general's office (Washington, D.C.).

(W. A. G.)

CERTALDO, a town of Tuscany, Italy, in the province of Florence, 35 m. S.S.W. by rail and 18 m. direct from the town of Florence. Pop. (1921) town, 4,006; commune, 10,548. It was the home of the family of Giovanni Boccaccio, who died and was buried here in 1375. His house of brick, was restored in 1823. A statue of him was erected in the principal square in 1875. The Palazzo Pretorio, or del Vicariato, the residence of the Florentine governors, recently restored to its original condition, has a picturesque façade and court. The picturesque town lies on a hill 426 ft. above sea-level.

See R. Pantini, *S. Gimignano e Certaldo* (Bergamo, 1904).

CERTHIDAE: *see* TREE-CREEPER.

CERTIFICATE OF DEPOSIT, a written receipt from a bank acknowledging the deposit therein of a certain sum of money. Under such certificate, money may be deposited either on a demand basis or a time basis, but in either case it cannot be drawn against by cheque. To withdraw funds deposited under a certificate of deposit it is necessary to present the certificate itself, properly endorsed. In the United States certificates of de-

posit are negotiable when properly endorsed and are usually acceptable as security for loans.

CERTIFICATE OF INDEBTEDNESS, a term used in the United States to describe a short-term note representing floating indebtedness. Corporations frequently borrow large sums for short periods, and as evidence of the debt give the lenders these certificates of indebtedness in various denominations. Where the issuer fails to pay the certificates at maturity, they are regarded as unsecured promissory notes, and the holders have the recourse of general creditors. The U.S. Treasury issues certificates of indebtedness, known as Treasury certificates, to obtain temporary funds, pending the receipt of tax payments.

CERTIFIED CHEQUE, a cheque regularly drawn against a depositor's account in a bank but having stamped or written on the face the word "certified" or "accepted," or the phrase "good when properly indorsed," or "good through clearing house," or some other expression commonly used, and the signature of a bank official, usually a cashier or paying teller, qualified to make certifications. The certification is the bank's guarantee that the signature of the drawer is genuine and that there are and will be sufficient funds to his credit to pay the cheque. A certified cheque becomes an obligation of the bank itself instead of merely an order upon the bank by the drawer. Immediately upon the certification of a cheque, the amount certified is set aside from the drawer's account specially for the purpose of paying the cheque; and other cheques which may be presented ahead of that certified will not be allowed to withdraw the funds so segregated. The advantage of the certified cheque is that it will not be refused payment on the ground of "no funds," or "not sufficient funds."

A cheque may be certified at the request of either the drawer or a holder. If certified at the request of a holder, however, both the drawer and the indorsers, if any, are released from obligation and the holder must look for payment to the bank alone, and the bank is absolutely liable unless the cheque was "raised," either before or after the certification. When a bank certifies a cheque at the request of the drawer, the latter is not released from liability, and if the bank should fail before the cheque is presented for payment, the holder will have recourse against the drawer.

(J. H. B.)

CERTIFIED PUBLIC ACCOUNTANT, an American designation the use of which is restricted by State law to accountants who have met the legal requirements of the State or States in which they seek recognition. In addition to meeting certain educational and professional demands, candidates must also submit to written examinations in the subjects prescribed. Upon fulfilling the conditions of the particular State, the accountant receives a certificate which entitles him to use the expression certified public accountant after his name, or the abbreviation, C.P.A. There are no regulations, either State or Federal, which prohibit an accountant who has not received a certificate from engaging in professional practice, but certain assignments which are made by courts of law can be handled only by Certified Public Accountants; without this certificate, accountants are finding it increasingly difficult to gain a footing in the profession. (See CHARTERED ACCOUNTANT; ACCOUNTANCY.)

GROUP OF CERUSSITE
A native lead ore which occurs in three colours, in solid or granular form

CERUSSITE, a mineral consisting of lead carbonate, $PbCO_3$, and forming an important ore of lead; it contains 77.5% of the metal. The name is derived from the Latin *cerussa*, "white lead." It crystallizes in the orthorhombic system, and often forms pseudo-hexagonal twins like those of aragonite, with which it is isomorphous. It also occurs in compact granular or fibrous forms. It is usually colourless or white, sometimes grey or greenish, and is usually more or less transparent: some well-formed crystals have a brilliant lustre. Its hardness is 3-3.5 and density 6.5. It effervesces with dilute nitric acid. Cerussite occurs in large quantities in the upper oxidized portions of lead.

CERUTTI, GIUSEPPE (1738-1792), French author and politician, was born at Turin. He taught at the Jesuit college at Lyons and wrote an *Apologie* (1762) for his order. His *Mémoire pour le peuple français* (1788) advocates the claims of the *tiers état*. He was a member of the Legislative Assembly and a friend of Mirabeau, whose funeral oration he pronounced. He, with Rabaut Saint-Étienne and Grouvelle, founded the weekly sheet *La Feuille villageoise*, addressed to the villages of France to inform them of the progress of the Revolution.

On the *Mémoire pour le peuple français*, see F. A. Aulard in *La Révolution française*, tom. xv. (1888).

CERVANTES SAAVEDRA, MIGUEL DE (1547-1616), Spanish novelist, playwright and poet, was born at Alcalá de Henares. He was the second son of Rodrigo de Cervantes, an apothecary-surgeon, and Leonor de Cortinas. The exact date of Cervantes' birth is not recorded; he was baptized on Oct. 9, 1547, in the church of Santa María la Mayor at Alcalá. There are indications that Rodrigo de Cervantes resided at Valladolid in 1554, at Madrid in 1561, at Seville in 1564-65, and at Madrid from 1566 onwards. It may be assumed that his family accompanied him, and it seems likely that either at Valladolid or at Madrid Cervantes saw the famous actor-manager and dramatist, Lope de Rueda, of whose performances he speaks enthusiastically in the preface to his plays. In 1569 a Madrid schoolmaster, Juan López de Hoyos, issued a work commemorative of Philip II.'s third wife, Isabel de Valois, who had died on Oct. 3, 1568. This volume, entitled *Hystoria y relación verdadera de la enfermedad, felicissimo tránsito, y sumptuosas exequias fúnebres de la Serenissima Reyna de España Doña Isabel de Valois, nuestra Señora*, contains six contributions by Cervantes: a sonnet, four redondillas, and an elegy. López de Hoyos introduces Cervantes as "our dear and beloved pupil," and the elegy is dedicated to cardinal Espinosa "in the name of the whole school." It has been inferred that Cervantes was educated by López de Hoyos, but this conclusion is untenable, for López de Hoyos' school was not opened till 1567. On Oct. 13, 1568, Giulio Acquaviva, reached Madrid charged with a special mission to Philip II.; he left for Rome on Dec. 2, and Cervantes is supposed to have accompanied him. This conjecture is based solely on a passage in the dedication of the *Galatea*, where the writer speaks of having been "camarero to cardinal Acquaviva at Rome." There is, however, no reason to think that Cervantes met Acquaviva in Madrid; the probability is that he enlisted as a supernumerary towards the end of 1568, that he served in Italy, and there entered the household of Acquaviva, who had been raised to the cardinalate on May 17, 1570. All that is known with certainty is that Cervantes was in Rome at the end of 1569, for on Dec. 22, of that year the fact was recorded in an official information lodged by Rodrigo de Cervantes with a view to proving his son's legitimacy and untainted Christian descent.

There is evidence, more or less, that he enlisted in the regular army in 1570; in 1571 he was serving as a private in the company commanded by Captain Diego de Urbina which formed part of Miguel de Moncada's famous regiment, and on Sept. 16 he sailed from Messina on board the "Marquesa," which formed part of the armada under Don John of Austria. At the battle of Lepanto (Oct. 7, 1571) the "Marquesa" was in the thickest of the conflict. As the fleet came into action Cervantes lay below, ill with fever; but, despite the remonstrances of his comrades he vehemently insisted on rising to take his share in the fighting and was posted with 12 men under him in a boat by the galley's side. He received three gunshot wounds, two in the chest, and one which permanently maimed his left hand—"for the greater glory of the right," in his own phrase. On Oct. 30, the fleet returned to Messina, where Cervantes went into hospital, and during his convalescence received grants-in-aid amounting to 82 ducats. On April 29, 1572 he was transferred to Captain Manuel Ponce de León's company in Lope de Figueroa's regiment; he shared in the indecisive naval engagement off Navarino on Oct. 7, 1572, in the capture of Tunis on Oct. 10, 1573, and in the unsuccessful expedition to relieve the Goletta in the autumn of 1574. The rest of his military service was spent in garrison at Palermo and Naples, and shortly after the arrival of Don John at Naples

on June 18, 1575, Cervantes was granted leave to return to Spain; he received a recommendatory letter from Don John to Philip II., and a similar testimonial from the duke de Sessa, viceroy of Sicily. Armed with these credentials, Cervantes embarked on the "Sol" to push his claim for promotion in Spain.

On Sept. 26, 1575, near Les Trois Maries off the coast of Marseilles, the "Sol" and its companion ships the "Mendoza" and the "Higuera" encountered a squadron of Barbary corsairs under Arnaut Mami; Cervantes, his brother Rodrigo and other Spaniards were captured, and were taken as prisoners to Algiers. Cervantes became the slave of a Greek renegade named Dali Mami, and, as the letters found on him were taken to prove that he was a man of importance in a position to pay a high ransom, he was put under special surveillance. In 1576 he induced a Moor to

PATIO OF CERVANTES' HOUSE

guide him and other Christian captives to Oran; the Moor deserted them on the road, the baffled fugitives returned to Algiers, and Cervantes was treated with additional severity. In the spring of 1577 two priests of the Order of Mercy arrived in Algiers with a sum of 300 crowns entrusted to them by Cervantes' parents; the amount was insufficient to free him, and was spent in ransoming his brother Rodrigo. Cervantes made another attempt to escape in Sept. 1577, but was betrayed by the renegade whose services he had enlisted. On being brought before Hassan Pasha, the viceroy of Algiers, he took the blame on himself, and was threatened with death; struck, however, by the heroic bearing of the prisoner, Hassan remitted the sentence, and bought Cervantes from Dali Mami for 500 crowns. In 1577 the captive addressed to the Spanish secretary of State, Mateo Vázquez, a versified letter suggesting that an expedition should be fitted out to seize Algiers; the project, though practicable, was not entertained. In 1578 Cervantes was sentenced to 2,000 strokes for sending a letter begging help from Martín de Córdoba, governor of Oran; the punishment was not, however, inflicted on him. Meanwhile his family were not idle. In March, 1578 his father presented a petition to the king setting forth Cervantes' services; the duke de Sessa repeated his testimony to the captive's merits; in the spring of 1579 Cervantes' mother applied for leave to export 2,000 ducats' worth of goods from Valencia to Algiers, and on July 31, 1579 she gave the Trinitarian monks, Juan Gil and Antón de la Bella, a sum of 250 ducats to be applied to her son's ransom. On his side Cervantes was indefatigable, and towards the end of 1579 he arranged to secure a frigate; but the plot was revealed to Hassan by Juan Blanco de Páz, a Dominican monk, who appears to have conceived an unaccountable hatred of Cervantes. Once more the conspirator's life was spared by Hassan, who, it is recorded, declared that "so long as he had the maimed Spaniard in safe keeping, his Christians, ships and city were secure." On May 29, 1580 the two Trinitarians arrived in Algiers: they were barely in time, for Hassan's term of office was drawing to a close, and the arrangement of any ransom was a slow process, involving much patient bargaining. Hassan refused to accept less than 500 gold ducats for his slave; the available funds fell short of this amount, and the balance was collected from the Christian traders of Algiers. Cervantes was already embarked for Constantinople when the money was paid on Sept. 19, 1580. The first use that he made of his liberty was to cause affidavits of his proceedings at Algiers to be drawn up; he sailed for Spain towards the end of October, landed at Denia in November, and made his way to Madrid. He signed an information before a notary in that city on Dec. 18, 1580.

These dates prove that he cannot, as is often alleged, have served under Alva in the Portuguese campaign of 1580: that campaign ended with the battle of Alcántara on Aug. 25, 1580. It seems certain, however, that he visited Portugal soon after his return from Algiers, and in May 1581, he was sent from Thomar on a mission to Oran. Construed literally, a formal statement of his

services, signed by Cervantes on May 21, 1590 makes it appear that he served in the Azores campaigns of 1582-83; but the wording of the document is involved, the claims of Cervantes are confused with those of his brother Rodrigo (who was promoted ensign at the Azores), and on the whole it is doubtful if he took part in either of the expeditions under Santa Cruz. In any case, the stories of his residence in Portugal, and of his love affairs with a noble Portuguese lady, who bore him a daughter, are simple inventions. From 1582-83 to 1587 Cervantes seems to have written copiously for the stage, and in the *Adjunta al Parnaso* he mentions several of his plays as "worthy of praise"; these were *El Trato de Argel*, *La Numancia*, *La Gran Turquesa*, *La Batalla naval*, *La Jerusalén*, *La Amaranta ó la de Mayo*, *El Bosque amoroso*, *La Única y Bizarra Arsinda*—"and many others which I do not remember, but that which I most prize and pique myself on was and is, one called *La Confusa*, which, with all respect to the present, may take a prominent place as being good among the best." Of these only *El Trato de Argel* and *La Numancia* have survived, and, though *La Numancia* contains many fine rhetorical passages, both plays go to prove that the author's genius was not essentially dramatic. In Feb. 1584 he obtained a licence to print a pastoral novel entitled *Primera parte de la Galatea*, the copyright of which he sold on June 14, to Blas de Robles, a bookseller at Alcalá de Henares, for 1,336 reales. On Dec. 12 he married Catalina de Palacios Salazar y Vozmediano of Esquivias, 18 years his junior. The *Galatea* was published in the spring of 1585. It was only twice reprinted—once at Lisbon (1590), and once at Paris (1611)—during the author's lifetime; but it won him a measure of repute; it was his favourite among his books, and during the 30 years that remained to him he repeatedly announced the second part which is promised conditionally in the text. However, it is not greatly to be regretted that the continuation was never published, though the *Galatea* is interesting as the first deliberate bid for fame on the part of a great genius. It is an exercise in the pseudo-classic literature introduced into Italy by Sannazaro, and transplanted to Spain by the Portuguese Montemör; and, ingenious or eloquent as the Renaissance prose-pastoral may be, its innate artificiality stifles Cervantes' rich and glowing realism. He himself recognized its defects; with all his weakness for the *Galatea*, he ruefully allows that "it proposes something and concludes nothing." Its comparative failure was a serious matter for Cervantes who had no other resource but his pen; his plays were probably less successful than his account of them would imply, and at any rate play-writing was not at this time a lucrative occupation in Spain. No doubt the death of his father on June 13, 1585, increased the burden of Cervantes' responsibilities; and the dowry of his wife, as appears from a document dated Aug. 9, 1586, consisted of nothing more valuable than five vines, an orchard, some household furniture, four beehives, 45 hens and chickens, one cock and a crucible.

It had become evident that Cervantes could not gain his bread by literature, and in 1587 he went to Seville to seek employment in connection with the provisioning of the Invincible Armada. He was placed under the orders of Antonio de Guevara, and before Feb. 24 was excommunicated for excessive zeal in collecting wheat at Ecija. During the next few months he was engaged in gathering stores at Seville and the adjacent district, and after the defeat of the Armada he was retained as commissary to the galleys. Tired of the drudgery, and without any prospect of advancement, on May 21, 1590 Cervantes drew up a petition to the king, recording his services and applying for one of four posts then vacant in the American colonies; a place in the department of public accounts in New Granada, the governorship of Soconusco in Guatemala, the position of auditor to the galleys at Cartagena, or that of *corregidor* in the city of La Paz. The petition was referred to the Council of the Indies, and was annotated with the words: "Let him look for something nearer home." In Nov. 1590 he was in such straits that he borrowed money to buy himself a suit of clothes, and in Aug. 1592 his sureties were called upon to make good a deficiency of 795 reales in his accounts. His thoughts turned to literature once more, and on Sept. 5, 1592, he signed a

contract with Rodrigo Osorio undertaking to write six plays at 50 ducats each, no payment to be made unless Osorio considered that each of these pieces was "one of the best ever produced in Spain." Nothing came of this agreement, and it appears that, between the date of signing it and Sept. 19, Cervantes was imprisoned (for reasons unknown to us) at Castro del Río. He was speedily released, and continued to perquisition as before in Andalusia; but his literary ambitions were not dead, and in May 1595 he won the first prize (three silver spoons) at a poetical tourney held in honour of St. Hyacinth at Saragossa. Shortly afterwards Cervantes found himself in difficulties with the exchequer officials. He entrusted a sum of 7,400 *reales* to a merchant named Simón Freire de Lima with instructions to pay the amount into the treasury at Madrid; the agent became bankrupt and absconded, leaving Cervantes responsible for the deficit. By some means the money was raised, and the debt was liquidated on Jan. 21, 1597. But Cervantes' position was shaken, and his unbusinesslike habits lent themselves to misinterpretation. On Sept. 6, 1597 he was ordered to find sureties that he would present himself at Madrid within 20 days, and there submit to the exchequer vouchers for all official moneys collected by him in Granada and elsewhere. No such sureties being available, he was committed to Seville gaol, but was released on Dec. 1, on condition that he complied with the original order of the court within 30 days. He was apparently unable to find bail, was dismissed from the public service, and sank into extreme poverty. During a momentary absence from Seville in Feb. 1599, he was again summoned to Madrid by the treasury, but does not appear to have obeyed; it is only too likely that he had not the money to pay for the journey. There is some reason to think that he was imprisoned at Seville in 1602, but nothing positive is known of his existence between 1600 and Feb. 8, 1603: at the latter date he seems to have been at Valladolid, to which city Philip III. had removed the court in 1601.

Since the publication of the *Galatea* in 1585 Cervantes' contributions to literature had been limited to occasional poems. In 1591 he published a ballad in Andrés de Villalta's *Flor de varios y nuevos romances*; in 1595 he composed a poem, already mentioned, to celebrate the canonization of St. Hyacinth; in 1596 he wrote a sonnet ridiculing Medina Sidonia's tardy entry into Cadiz after the English invaders had retired, and in the same year his sonnet lauding Santa Cruz was printed in Cristóbal Mosquera de Figueroa's *Comentario en breve compendio de disciplina militar*; to 1597 is assigned a sonnet (the authenticity of which is disputed) commemorative of the poet Herrera; in 1598 he wrote two sonnets and a copy of quintillas on the death of Philip II.; and in 1602 a complimentary sonnet from his pen appeared in the second edition of Lope de Vega's *Dragontea*. Curiously enough, it is by Lope de Vega that *Don Quixote* is first mentioned. Writing to an unknown correspondent (apparently a physician) on Aug. 14, 1604, Lope de Vega says that "no poet is as bad as Cervantes, nor so foolish as to praise *Don Quixote*," and he goes on to speak of his own plays as being odious to Cervantes. It is obvious that the two men had quarrelled since 1602, and that Lope de Vega smarted under the satire of himself and his works in Cervantes' forthcoming book; *Don Quixote* may have been circulated in manuscript, or may even have been printed before the official licence was granted on Sept. 26, 1604. It was published early in 1605, and was dedicated to the seventh duke de Béjar in phrases largely borrowed from the dedication in Herrera's edition (1580) of Garcilaso de la Vega, and from Francisco de Medina's preface to that work.

The mention of Bernardo de la Vega's *Pastor de Iberia* shows that the sixth chapter of *Don Quixote* cannot have been written before 1591. In the prologue Cervantes describes his masterpiece as being "just what might be begotten in a gaol"; on the strength of this passage, it has been thought that he conceived the story, and perhaps began writing it, during one of his terms of imprisonment at Seville between 1597 and 1602. Within a few weeks of its publication at Madrid, three pirated editions of *Don Quixote* were issued at Lisbon; a second authorized edition, imperfectly revised, was hurried out at Madrid; and another reprint

appeared at Valencia with an *aprobación* dated July 18, 1605. With the exception of Alemán's *Gusmán de Alfarache*, no Spanish book of the period was more successful. Modern criticism is prone to regard *Don Quixote* as a symbolic, didactic or controversial work intended to bring about radical reforms in Church and State. Such interpretations did not occur to Cervantes' contemporaries, nor to Cervantes himself. There is no reason for rejecting his plain statement that his main object was to ridicule the romances of chivalry, which in their latest developments had become a tissue of tiresome absurdities. It seems clear that his first intention was merely to parody these extravagances in a short story; but as he proceeded the immense possibilities of the subject became more evident to him, and he ended by expanding his work into a brilliant panorama of Spanish society as it existed during the 16th century. Nobles, knights, poets, courtly gentlemen, priests, traders, farmers, barbers, muleteers, scullions and convicts; accomplished ladies, impassioned damsels, Moorish beauties, simple-hearted country girls and kindly kitchen-wenchies of questionable morals—all these are presented with the genial fidelity which comes of sympathetic insight. The immediate vogue of *Don Quixote* was due chiefly to its variety of incident, to its wealth of comedy bordering on farce, and perhaps also to its keen thrusts at eminent contemporaries; its reticent pathos, its large humanity, and its penetrating criticism of life were less speedily appreciated.

Meanwhile on April 12, 1605, Cervantes authorized his publisher to proceed against the Lisbon booksellers who threatened to introduce their piratical reprints into Castile. By June the citizens of Valladolid already regarded *Don Quixote* and Sancho Panza as proverbial types. Practically nothing is known of Cervantes' life between 1605 and 1608. A *Relación* of the festivities held to celebrate the birth of Philip IV., and a certain *Carta á don Diego Astudillo Carrillo* have been erroneously ascribed to him; during these three years he apparently wrote nothing beyond three sonnets, and one of these is of doubtful authenticity. The depositions of the Valladolid enquiry show that he was living in poverty five months after the appearance of *Don Quixote*, and the fact that he borrowed 450 *reales* from his publisher before Nov. 1607 would convey the idea that his position improved slowly, if at all. But it is difficult to reconcile this view of his circumstances with the details concerning his illegitimate daughter revealed in documents recently discovered. Isabel de Saavedra was stated to be a spinster when arrested at Valladolid in June, 1605; the settlement of her marriage with Luis de Molina in 1608 describes her as the widow of Diego Sanz, as the mother of a daughter eight months old, and as owning house-property of some value. These particulars are perplexing, and the situation is further complicated by the publication of a deed in which Cervantes declares that he himself is the real owner of this house property, and that his daughter has merely a life-interest in it. This claim may be regarded as a legal fiction; it cannot easily be reconciled with Cervantes' statement towards the end of his life, that he was dependent on the bounty of the count de Lemos and of Bernardo de Sandoval, cardinal-archbishop of Toledo. In 1609 he joined the newly founded confraternity of the Slaves of the Most Blessed Sacrament; in 1610 Lemos was appointed viceroy of Naples, and Cervantes was keenly disappointed at not being chosen to accompany his patron. In 1611 he joined the Academia Selvaje, and there appears to have renewed his former friendly relations with Lope de Vega; in 1613 he dedicated his *Novelas exemplares* to the count de Lemos, and disposed of his rights for 1,600 *reales* and 24 copies of the book. The 12 tales in this volume, some of them written very much later than others, are of unequal merit, but they contain some of the writer's best work, and the two picaresque stories—*Rinconete y Cortadillo* and the *Coloquio de los perros*—are superb examples of their kind, and would alone entitle Cervantes to take rank with the greatest masters of Spanish prose. In 1614 he published the *Viage del Parnaso*, a burlesque poem suggested by the *Viaggio in Parnaso* (1582) of the Perugian poet Cesare Caporali. It contains some interesting autobiographical passages, much flattery of contemporary poetasters, and a few happy satirical touches; but, though

it is Cervantes' most serious bid for fame as a poet, it has seldom been reprinted, and would probably have been forgotten but for an admirably humorous postscript in prose which is worthy of the author at his best. In the preface to his *Ocho comedias y ocho entremeses nuevos* (1615) he good-humouredly admits that his dramatic works found no favour with managers, and, when this collection was first reprinted (1749), the editor advanced the fantastic theory that the comedias were deliberate exercises in absurdity, intended to parody the popular dramas of the day. This view cannot be maintained, but a sharp distinction must be drawn between the eight set plays and the eight interludes; with one or two exceptions, the comedias or set plays are unsuccessful experiments in Lope de Vega's manner, while the entremeses or interludes, particularly those in prose, are models of spontaneous gaiety and ingenious wit.

In the preface to the *Novelas ejemplares* Cervantes had announced the speedy appearance of the sequel to *Don Quixote* which he had vaguely promised at the end of the first part. He was at work on the 59th chapter of his continuation when he learned that he had been anticipated by Alonso Fernandez de Avellaneda of Tordesillas, whose *Segundo tomo del ingenioso hidalgo don Quixote de la Mancha* was published at Tarragona in 1614. On the assumption that Fernandez de Avellaneda is a pseudonym, this spurious sequel has been ascribed to the king's confessor, Luis de Aliaga, to Cervantes' old enemy, Blanco de Paz, to his old friend, Bartolomé Leonardo de Argensola, to the three great dramatists, Lope de Vega, Tirso de Molina and Ruiz de Alarcón, to Alonso Fernandez, to Juan José Martí, to Alfonso Lambert, to Luis de Granada, and probably to others. Some of these attributions are manifestly absurd (for example, Luis de Granada died 17 years before the first part of *Don Quixote* was published) and all of them are improbable conjectures; if Avellaneda be not the real name of the author, his identity is still undiscovered. His book is not devoid of literary talent and robust humour, and possibly he began it under the impression that Cervantes was no more likely to finish *Don Quixote* than to finish the *Galatea*. He should, however, have abandoned his project on reading the announcement in the preface to the *Novelas ejemplares*; what he actually did was to disgrace himself by writing an insolent preface taunting Cervantes with his physical defects, his moral infirmities, his age, loneliness and experiences in gaol. He was too intelligent to imagine that his continuation could hold its own against the authentic sequel, and malignantly avowed his intention of being first in the field and so spoiling Cervantes' market. It is quite possible that *Don Quixote* might have been left incomplete but for this insulting intrusion; Cervantes was a leisurely writer and was, as he states, engaged on *El Engaño a los ojos*, *Las Semanas del Jardín* and *El Famoso Bernardo*, none of which has been preserved. Avellaneda forced him to concentrate his attention on his masterpiece, and the authentic second part of *Don Quixote* appeared towards the end of 1615. The last 14 chapters are damaged by undignified denunciations of Avellaneda; but, apart from this, the second part of *Don Quixote* is an improvement on the first. The humour is more subtle and mature; the style is of more even excellence; and the characters of the bachelor and of the physician, Pedro Recio de Agüero, are presented with a more vivid effect than any of the secondary characters in the first part. Cervantes had clearly profited by the criticism of those who objected to "the countless cudgellings inflicted on Señor Don Quixote," and to the irrelevant interpolation of extraneous stories in the text. *Don Quixote* moves through the second part with unruffled dignity; Sancho Panza loses something of his rustic cunning, but he gains in wit, sense and manners. The original conception is unchanged in essentials, but it is more logically developed, and there is a notable progress in construction. Cervantes had grown to love his knight and squire, and he understood his own creations better than at the outset; more completely master of his craft, he wrote his sequel with the unfaltering confidence of a renowned artist bent on sustaining his reputation.

The first part of *Don Quixote* had been reprinted at Madrid in 1608; it had been produced at Brussels in 1607 and 1611, and at

Milan in 1610; it had been translated into English in 1612 and into French in 1614. Cervantes was celebrated in and out of Spain, but his celebrity had not brought him wealth. The members of the French special embassy, sent to Madrid in Feb. 1615, under the Commandeur de Sillery, heard with amazement that the author of the *Galatea*, the *Novelas ejemplares* and *Don Quixote* was "old, a soldier, a gentleman and poor." He now worked assiduously at *Los Trabajos de Persiles y Sigismunda*, which, as he had jocosely prophesied in the preface to the second part of *Don Quixote*, would be "either the worst or the best book ever written in our tongue." It is the most carefully written of his prose works, and the least animated or attractive of them; signs of fatigue and of waning powers are unmistakably visible. On April 18, 1616, Cervantes received the sacrament of extreme unction; next day he wrote the dedication of *Persiles y Sigismunda* to the count de Lemos—the most moving and gallant of farewells. He died at Madrid in the Calle del León on April 23; he was borne from his house "with his face uncovered," according to the rule of the Tertiaries of St. Francis, and on April 24 was buried in the church attached to the convent of the Trinitarian nuns in the Calle de Cantarranas. There he rests (the story of his remains being removed in 1633 to the Calle del Humilladero has no foundation in fact) but the exact position of his grave is unknown. Early in 1617 *Persiles y Sigismunda* was published, and passed through eight editions within two years; but the interest in it soon died away, and it was not reprinted between 1625 and 1719. Cervantes' wife died without issue on Oct. 31, 1626; his natural daughter, who survived both the child of her first marriage and her second husband, died on Sept. 20, 1652. Cervantes is represented solely by his works. The *Novelas ejemplares* alone would give him the foremost place among Spanish novelists; *Don Quixote* entitles him to rank with the greatest writers of all time: "children turn its leaves, young people read it, grown men understand it, old folk praise it." It has outlived all changes of literary taste, and is even more popular to-day than it was three centuries ago.

CERVERA, PASCUAL CERVERA Y TOPETE (1839–1909), Spanish admiral, was born at Medina Sidonia. As a sub-lieutenant he took part in the naval operations on the coast of Morocco during the campaign of 1859–60. Then he was engaged in operations in the Sulu Islands and the Philippines, and afterwards on the West Indian station during the first Cuban War (1868–78), returning to Spain in 1873 to serve on the Basque coast against the Carlists. He distinguished himself in defending the Carraca arsenal near Cadiz against the Federals in 1873. He became minister of marine in 1892, in a cabinet presided over by Sagasta, but he withdrew from the cabinet when he found that his colleagues, from political motives, declined to support his reforms and, on the other hand, unwisely cut down the naval estimates. When in 1898 the Spanish-American War (*q.v.*) broke out, he was chosen to command a squadron composed of four first-class cruisers, which was totally destroyed by the superior

forces of the enemy. After the war, Cervera and his captains were honourably acquitted by the supreme naval and military court of the realm. In 1901 he became vice-admiral, in 1902 chief of staff of the Spanish navy, and in 1903 was made life senator.

See A. Risco, *Apuntes Biograficos del Cervera y Topete* (Toledo, 1920).

CESAREVICH (better **TSAREVICH**), the title until 1917 of the heir-apparent to the Russian throne. The full official title was *Nasljednik Tsarevitch*; i.e., "heir of Caesar," and in Russian the heir to the throne was commonly called simply *Nasljednik*, the word *Tsarevitch* never being used alone. *Tsarevitch* means any son of the emperor. The Cesarewitch handicap race at Newmarket, founded in 1839, was named after the prince, afterwards Alexander II. of Russia, who paid a state visit to England that year.

CESARI, GIUSEPPE (1568?-1640), called *Il Cavaliere d'Arpino*, also *Il Giuseppino*, Italian painter, born in Rome. His father was a native of Arpino. Cesari ranks as the head of the so-called "Idealists" of his period, as opposed to the "Naturalists," of whom Michelangelo da Caravaggio was the leader. Lanzi stigmatized Cesari as not less the corrupter of taste in painting than Marino was in poetry. The defects of drawing and perspective in his work may be seen in his frescoes in the Capitol at Rome, which occupied him at intervals during 40 years. He died in Rome in 1640. His brother Bernardino assisted in many of his works.

CESAROTTI, MELCHIORE (1730-1808), Italian poet, was born on May 15, 1730, at Padua, where he held the chair of rhetoric, and in 1768 the professorship of Greek and Hebrew. Cesarotti is best known as the author of an admirable translation (2 vols., 1763) of Ossian, which raised up many imitators of the Ossianic style. He also produced a number of prose works on aesthetics. He died at Padua on Nov. 3, 1808.

See the complete edition of his works (42 vols., Pisa, 1800-13); G. F. Barbieri, *Memoirs* (Padua, 1810); L. Alemanni, *Un Filosofo delle lettere* (Turin, 1894).

CESENA (anc. **CAESENA**), a town and episcopal see of Emilia, Italy, province of Forlì, 12m. S.E. by rail from the town of Forlì, on the line between Bologna and Rimini, 144ft. above sea-level. Pop. (1921) 15,943 (town); 53,962 (commune). The town is at the foot of the Apennines, and is crowned by a mediaeval fortress (Rocca). The fine early Renaissance library was built for Domenico Malatesta in 1452 by Matteo Nuti, and its internal arrangements, with the original desks to which the books are still chained, are well preserved. It also contains a picture gallery. There are some fine palaces in the town. On the hill to the south-east the handsome church of S. Maria del Monte, after the style of Bramante, has carved stalls of the 16th century. The ancient Caesena was a station on the Via Aemilia and a fortress in the wars of Theodoric and Narses. In 1357 it was unsuccessfully defended by the wife of Francesco Ordelaifi, lord of Forlì, against the papal troops under Alborno. In 1377 it was sacked by Cardinal Robert of Geneva (afterwards Clement VII., anti-pope). It was then held by the Malatesta of Rimini until 1465, when it came under the dominion of the Church. Both Pius VI. (1717) and Pius VII. (1742) were born at Cesena.

CESNOLA, LUIGI PALMA DI (1832-1904), Italian-American soldier and archaeologist, was born at Rivarolo, near Turin, Italy, on July 29, 1832, of an ancient but impoverished family. Educated for a military career, he served with distinction against Austria (1848-49) and in the Crimean war, and going to New York in 1860, founded there a training school for army officers. He fought in the American Civil War as colonel of a New York cavalry regiment, received mention for bravery in several encounters, was wounded and imprisoned, and after the war was brevetted brigadier-general. Renouncing his Italian titles, he received a presidential appointment as U.S. consul to Cyprus (1865-77), where he made extensive excavations of ancient pottery at Larnaca and Salinos, and verified and surveyed the sites of Paphos, Soli and Pali. In 1872 the New York Metropolitan Museum purchased his collection, which became the nucleus for subsequent extensive acquisitions. In 1879 he was appointed

director of the museum, a post which he filled until his death, and in which he displayed foresight and energy. The authority of his restorations was questioned in an article in the *New York Herald* (Aug. 1880), but the question, on being referred to a special committee, was decided in his favour. In 1897 he received a Congressional medal of honour for conspicuous military services. He died in New York on Nov. 21, 1904. He is the author of *Cyprus, Its Ancient Cities, Tombs, and Temples* (1877), and of a *Descriptive Atlas of the Cesnola Collection of Cypriote Antiquities* (1884-86). His brother, Alessandro Palma di Cesnola, born in 1839, conducted excavations at Paphos (where he was U.S. vice-consul) and Salamis, on behalf of the British Government. These are described in *Salaminia* (1882). (See **CYPRUS**.)

For the Cesnola controversy, see D. D. Cobham's *Attempt at a Bibliography of Cyprus* (4th ed., 1900). (W. B. F.)

CESPEDES (in Ital. **CEDASPE**), **PABLO DE** (1538-1608), Spanish poet, painter, sculptor and architect, was born at Cordova and educated at Alcalá de Henares, where he studied theology and oriental languages. On leaving the university he went to Rome, where he became the pupil and friend of Federigo Zuccaro, under whose direction he studied particularly the works of Raphael and Michelangelo. In 1560, while he was yet in Rome, proceedings were taken against him by the Inquisition at Valladolid, but they were dropped. He returned to Spain a little before 1577 and received a prebend of the cathedral at Cordova, where he resided till his death. Cristobal de Vera, Juan de Peñalosa and Zambrano were among his pupils. His best picture is a "Last Supper" at Cordova, but there are good examples of his work at Seville and at Madrid. Cespedes was author of several opuscles in prose on subjects connected with his profession. His poem on "The Art of Painting," partly preserved by Pacheco, is esteemed the best didactic verse in Spanish. It contains a glowing eulogy of Michelangelo. The few remaining fragments were first printed by Pacheco in his treatise *Del arte de la pintura*, in 1649.

CÉSPEDES Y MENESES, GONZALO DE (1585?-1638), Spanish novelist, was born at Madrid, and published his celebrated romance, the *Poema trágico del Español Gerardo, y desengaño del amor lascivo* in 1615-17. His treatment of political questions in the *Historia apologetica en los sucesos del reyno de Aragón, y su ciudad de Zaragoza, años de 91 y 92* (1622), having led to the confiscation of the book, Céspedes took up his residence at Saragossa and Lisbon. While in exile he issued a collection of short stories entitled *Historias peregrinas y exemplares* (1623), and wrote the first part of his *Historia de Felipe IV.* (1631), a fulsome eulogy which was rewarded by the post of official historiographer to the Spanish king. Céspedes died on Jan. 27, 1638. His novels, though written in an affected style, display considerable imagination and insight into character. The *Poema trágico* was utilized by Fletcher in *The Spanish Curate* and *The Maid of the Mill*.

The *Historias peregrinas* had been reprinted (1906) with a valuable introduction by Sr. Cotarelo y Mori.

CESS, a term formerly more particularly applied to local taxation, in which sense it still is used in Ireland; otherwise it has been superseded by "rate." In India it is applied, with the qualifying word prefixed, to any taxation, such as "irrigation-cess" and the like, and in Scotland to the land-tax. The word is a shortened form of "assess"; and the spelling is due to a mistaken connection with "census."

CESSIO BONORUM, in Roman law, a voluntary surrender of goods by a debtor to his creditors. It did not amount to a discharge unless the property ceded was sufficient for the purpose, but it secured the debtor from personal arrest. The creditors sold the goods in satisfaction, *pro tanto*, of their claims. The procedure of *cessio bonorum* avoided infamy, and the debtor, though his after-acquired property might be proceeded against, could not be deprived of the bare necessities of life. The main features of the Roman law of *cessio bonorum* were adopted in Scots law, and also in the French and several other legal systems. In England it exists under the internal regulations of certain commercial bodies, such as the recognized Stock Exchanges. In Scotland the

process of *cessio bonorum* was abolished by the Bankruptcy (Scotland) Act 1913. (See further, BANKRUPTCY.)

CESTI, MARC' ANTONIO (1618-1669), Italian musical composer, was born at Florence (or according to some authorities at Arezzo) in 1618. He was a pupil of Carissimi, and is known principally as a composer of operas, notable for the pure and delicate style of their airs, the most celebrated of which were *La Dori* (Venice, 1663) and *Il Pomo d'oro* (Vienna, 1668).

CESTIUS, LUCIUS, surnamed Prus, Latin rhetorician, was a native of Smyrna, a Greek by birth. According to Jerome, he was teaching Latin at Rome in the year 13 B.C. As an orator in the schools he enjoyed a great reputation. As a public orator, on the other hand, he was a failure. Specimens of his declamations will be found in the works of Seneca the rhetorician.

See Seneca, *Controv.*, ix. 3, 12; J. Brzoska, in Pauly-Wissowa's *Realencyklopädie*, iii. 2 (1899) and *Suasoriae*, vii. 13 (for anecdotes).

CESTUL, CESTUY: see TRUST AND TRUSTEES.

CETACEA, an order of mammals (from the Gr. *κῆτος*, a whale), divisible into three suborders:—Archaeoceti, exclusively fossil; Mysticoceti, whalebone whales; and Odontoceti, toothed whales, comprising sperm whales, bottle-nosed whales and dolphins. The term "whale" does not indicate a natural division of the order, and it is used here to mean any member of the Cetacea, irrespective of size. The lengths of these animals are mostly between 4 and 100 feet. Their ancestors were probably land mammals, whose structure has been modified in many respects to adapt them for life in the water, from birth to death. Whales are warm-blooded, breathing air by lungs, without scales in their skin, with hands of the 5-fingered type, with skeleton, brain, heart and blood-vessels mammalian in structure, reproducing like other mammals and nourishing their young with milk; in all these respects differing essentially from fishes, to which they have a merely superficial resemblance. Certain species swim habitually in large schools. A few live entirely in fresh water. The majority are marine, some frequenting the coasts, but others oceanic, rarely approaching land. Many undertake extensive migrations and have a wide distribution. Whales have been known to follow a ship for several consecutive days, and Racovitza has used this as an argument for the view that they do not sleep.

External Form (fig. 1).—Whales swim mainly by the tail, which is produced into two horizontal flukes, not supported by any part of the skeleton, and are thus easily distinguished from fishes, in which the tail is vertical. A dorsal fin, similarly without skeleton, is generally present. The mouth has immovable lips. The fore limbs (flippers) have the form of paddles, and are used

AFTER LUTKEN

FIG. 1.—KILLER (ORCINUS ORCA), THE LARGEST OF THE DOLPHINS

principally for maintaining the balance of the body and for steering. External hind limbs are wanting. The neck is short and rarely distinguishable in the living animal. The nostrils (blow-holes) have been shifted to the upper side of the head, at some distance from the tip of the snout or beak. The part in front of the blow-hole may resemble a forehead, but it really belongs to the beak. Eyes are well developed, but there are no external ears and the outer opening of the ear is minute. The skin is smooth, hairs being usually absent in the adult, except as occasional vestiges. The vent is at the root of the tail, behind the reproductive

opening, on either side of which, in the female, is a groove containing a teat. The umbilicus (navel) is often visible farther forwards, especially in young individuals.

Other Distinguishing Characters.—The brain-case is short and lofty; the nasal canals pass nearly vertically downwards in front of it, and the facial part is prolonged horizontally forwards as a rostrum. The auditory bones are highly modified; the tympanics are shell-like and loosely attached to the skull. The neck vertebrae are of the typical mammalian number (7), short, often fusing with one another; the second, if free, has no prominent odontoid process, the structure on which the head turns in other mammals. The lumbar and caudal vertebrae are freely movable, the interlocking processes of their upper arches disappearing from the thorax backwards. The ribs are very movable on the vertebrae and sternum (breast-bone). The clavicles (collar-bones) are wanting. The flippers show no external division into hand, fore arm and upper arm, and are without definite joints at the elbow and wrist. They contain the typical mammalian bones, but the finger-joints (phalanges) are more numerous in some of the digits than in other mammals. Digits are 5 or 4 without nails. The pelvis is represented by a small curved bone on each side, embedded in the flesh near the reproductive opening; it does not articulate with the vertebral column, which has no fused sacral vertebrae. In right whales and the sperm whale each half may carry a small bony or cartilaginous vestigial hind limb. The brain is large, its cerebral hemispheres much convoluted. Olfactory organs are almost absent, the nasal passages being functionally continuous with the larynx. The diaphragm is very oblique, the stomach has several distinct chambers. The main arteries and veins break up into plexuses of vessels known as *retia mirabilia*. The kidneys are lobulated. The male organ is usually completely retracted, thus not interrupting the smooth contour of the body. The testes are within the abdomen, the uterus bicornuate, the placenta diffuse.

Respiration.—A large whale usually rises to breathe every 5-10 minutes, but the interval may be at least 45 minutes. The blow-holes (fig. 2) are either two longitudinal

FIG. 2.—BLOW-HOLES, FROM ABOVE

A. Whalebone whale
B. Dolphin

holes (fig. 2) are either two longitudinal slits (whalebone whales) or a single crescentic slit (toothed whales). On reaching the surface, the whale exposes and opens its nostrils, which are closed during submergence, and discharges the exhausted air from its lungs. This is done with considerable force, often producing an audible sound, and the animal is said to blow. The moist air projected upwards is visible from a long distance, in the case of the larger whales, as a column containing particles of condensed water (the spout) formerly regarded as a fountain of water ejected from the head. Expiration is followed immediately by inspiration, and the whale then sinks horizontally. It repeats these actions several times, rising to the surface on each occasion without exposing much more than the part of its head which carries the blow-holes. When it has thus thoroughly changed the air in its lungs, it rises in a different manner. The back is strongly arched and much of it becomes visible. The back fin, if present, appears to be situated on a rotating wheel, rising from behind, reaching the summit of the arched back and descending into the water in front. The whale then leaves the surface and is said to sound. The maximum depth of its dive has been supposed to be at least 100 fathoms. The right whales, humpback and sperm whale (but not the rorquals) usually throw their tails above the surface as they sound; and at other times, like many of the dolphins, they leap completely clear of the water. Differences in these respects, and in the form and direction of the spout, enable whalers to distinguish species.

The horizontal position of the tail-flukes facilitates rising to the surface and returning to the depths, movements of vital importance to the Cetacea. Another effective adaptation to aquatic life is the course taken by the air in passing to the lungs. The larynx and epiglottis form a tube passing through the pharynx into the lower end of the nasal passages (fig. 3). Here it is grasped by the soft palate, and the blow-holes thus become continuous with the

windpipe and lungs, the mouth being used solely for feeding—as in recently born marsupials, but not as in other adult mammals, which can breathe through either the nose or the mouth.

Prolonged submergence involves other demands on the respiratory organs. The thoracic cavity of the Cetacea is unusually extensible, and thus provides for a corresponding expansion of the lungs, depending on the loose attachments of the ribs and the

FIG. 3.—MEDIAN SECTION OF THE HEAD OF A PORPOISE, TO SHOW THE COURSE TAKEN BY AIR AND BY THE FOOD

considerable projection of the oblique diaphragm into the cavity of the contracted thorax. Whales have a larger amount of blood, in proportion to their size, than other mammals, and this involves an increased capacity for carrying oxygen to the tissues by means of haemoglobin, the red colouring matter. The very deep red colour of the muscles seems to imply that these structures also hold a specially large quantity of oxygen. The characteristic retia mirabilia are further adaptations. In the common porpoise, for instance, the upper and lateral parts of the thorax are covered by an elaborate arterial rete mirabile, lying just outside its lining membrane. Branches of this plexus extend upwards into the neural canal of the vertebral column, an arrangement which ensures an adequate supply of oxygen to the spinal cord and brain. Although physiological evidence cannot be quoted, the retia mirabilia probably act as reservoirs, the arterial portions containing a large supply of oxygen, the amount of which may largely influence the duration of submergence. The venous portions probably hold exhausted blood, which would otherwise circulate too freely. The principal danger to which a diver is exposed is the liberation of gas-bubbles into his blood, due to diminishing water-pressure, if the ascent to the surface is too rapid. The retia may perhaps have the function of retaining bubbles and of preventing their access to the general circulation.

Hair.—Whales maintain a constant high temperature, not very different from that of man. A hairy coat has been discarded, as a means of avoiding the loss of heat, in favour of blubber; but a few vestigial hairs may occur—an unmistakable sign of the origin of Cetacea from land mammals. In *Inia* numerous scattered hairs occur on the beak. Whalebone whales have hairs, in *Rhachianectes* up to 40mm. long, on parts of the head and lower jaw; and in dolphins a few long hairs are found on the beak, before birth.

Skin and Colour.—The outer, horny layer of the epidermis is thin and readily separates from the body after death. The deeper layer is nearly always pigmented, in certain parts, which then appear black, or varying shades of grey, brown or blue. The commonest type of colouration is dark above and white below, the relative extent of these regions varying with the species, the white area sometimes increasing with age. Many dolphins have a black streak extending from the eye to the flipper, perhaps representing the lower limit of the ancestral dark region. Some whales are completely black or white. In certain cases the normal white is replaced by a bright yellow colour. A. G. Bennett found that in Antarctic rorquals this is due to an external film composed of an enormous number of diatoms. These unicellular algae were found all over the skin, but were not conspicuous on the dark parts. In the common porpoise and its allies the skin of the edge of the dorsal fin or flippers bears a series of small, horny tubercles, which have been considered by some authors to indicate an affinity to Edentate mammals, a conclusion not universally accepted. The deeper part of the skin (dermis) is

usually inconspicuous, but is better developed in the *Delphinapteridae*. The white whale, belonging to this family, has a thick epidermis and a rather thinner dermis, and its skin has been used commercially as "porpoise leather."

Blubber.—This characteristic part of a cetacean is formed of tough fibrous tissue enclosing an enormous amount of oil. It invests every part of the whale, but is thicker in certain regions, for instance near the dorsal fin. In the sperm whale the maximum thickness is as much as 14in., and in the Greenland whale 20 inches. In the latter, according to Scoresby, 4 tons of blubber, by volume, yield 3 tons of oil. In a whale of 70 tons the blubber weighs about 30 tons, and 2 tons of oil may be extracted from each of the gigantic lower lips. The blubber of the rorquals now hunted is thinner, and in the smaller dolphins it does not much exceed one inch. Although specially important in retaining heat, the insulating properties of this layer probably afford protection against an excess of warmth in tropical waters. Blubber is little developed in newly born whales, and perhaps for this reason the parent resorts to warmer water to give birth to her young. It varies in condition at different times, a whale being often lean on its first arrival in polar seas, where the blubber improves in quality owing to the large amount of food found in those waters. The stomachs of whales captured in temperate latitudes are sometimes empty, and blubber is probably a reserve material which can be drawn on when food is scarce. It may further help materially to prevent the crushing of the tissues, during a deep dive, by the enormous pressure of the superjacent water.

Food.—Dolphins typically eat fishes, to which diet they are adapted by their teeth, generally numerous and uniformly conical; but cuttlefish also may be eaten. The stomach of a species of *Sotalia* has been found to contain vegetable matter. The Killer is exceptional in eating marine mammals and birds, in addition to fishes. The sperm whale and the bottle-nosed whales (*Ziphiidae*) are mainly dependent on cuttlefish, some of which must be obtained at considerable depths; but these also take occasional fishes. A diet of cuttlefish is often associated with a reduction of the number of teeth, in certain dolphins, the sperm whale and the *Ziphiidae*.

Whalebone.—The whalebone whales feed exclusively on plankton (*q.v.*), including fishes. They obtain food by means of a whalebone sieve, and the adequacy of the method may be estimated by the fact that two tons of plankton have been taken from the stomach of a blue whale. Plankton is specially abundant in the cold waters of both polar regions, and whales visit them to profit by this plenty.

Whalebone or baleen is derived from the skin lining the mouth and has nothing to do with true bone. The sieve is composed of

AFTER DELAGE
FIG. 4.—TRANSVERSE SECTION OF A RORQUAL'S HEAD TO SHOW WHALEBONE

two sides, each running longitudinally along the entire length of the outermost part of the palate, and being continuous with its fellow at the front of the beak. A side consists of as many as 300–400 transversely placed, flexible, and horny blades, embedded at their base in a substance known as the gum, and with a short interval between each two. The blades are longest and widest at the middle of the series and progressively smaller towards both ends, where they become very short. Seen from the front or back, an isolated blade appears roughly triangular (fig. 4), the shortest side embedded in the gum, the outer border straight, and the inner

border slightly convex. On the inner aspect of each principal blade is a transverse row of a few very short blades; and all the blades are produced into long hairlike structures, composed of the same substance as the whalebone itself. Owing to the presence of these hairs, the sieve, seen from its inner side, resembles a door-mat or the fleece of a sheep. Between the two sieves lies the tongue, which is of immense size, in contrast with the much smaller tongue of the toothed whales.

The two halves of the lower jaw are greatly arched outwards, the mouth being thus enormous. The blades are bent backwards by the closure of the mouth, recovering a vertical position, by their own elasticity, as it opens. The great lower lip overlaps the outer edges of the blades, and the water must thus escape from the mouth through the chinks between these structures. The whale feeds, after sounding, by swimming through a shoal of plankton with its mouth open. Water enters at the front end; and, before it leaves, the food has been strained off by the hairy fringes of the baleen-plates. The mouth is then closed, the tongue having no doubt helped to force out the water, while licking the food off the sieve. The characters of the baleen afford one of the most convenient ways of distinguishing species of whalebone whales. The blades are longest in the Greenland whale, where they may reach the astonishing length of 15 feet.

Sense-organs.—The olfactory organs are greatly reduced, and it is doubtful whether whales have the sense of smell. The nasal passages, however, are of vital importance, since they serve as the sole method of admitting air to the lungs. The eyes are small, with arrangements for withstanding water-pressure. Scoresby stated that vision is acute in the Greenland whale, which is dull of hearing in the air, but is readily alarmed by even a slight splashing in the water. The external auditory passage is narrow and opens by a minute hole on the head, not far behind the eye. In whalebone whales it is blocked by a large mass of wax, several inches in length, and it cannot be of much service in hearing. It is believed that vibrations in the water reach the ear through sacs given off by the Eustachian tubes or through the bones and other tissues of the head. The tympanic bones are dense and shell-like, well developed and loosely connected with the rest of the skull. There can be little doubt that the auditory organs are of real importance.

Breeding.—The Cetacea are in all respects typically mammalian in their reproduction. The young is nourished in the uterus by a placenta, and is not born until it has attained a form essentially that of the adult, sometimes exceeding one-third the length of the mother. In the common porpoise (5½ ft.) the newly born young is about 2 ft. long and in the largest whalebone whales at least 20 feet. A single young is typically produced, but twins occur and 7 foetuses have been found in a blue whale. The period of gestation is probably something less than a year, but whalebone whales are commonly believed not to produce young more often than once in two years. In certain species birth appears to take place at a more or less definite season, as in the common porpoise, principally in the late spring or early summer. Among whalebone whales there is some reason to believe that the frequencies of births, and therefore of pairings, in the several months can be represented by a regular curve showing a distinct maximum at a definite period in the year; although either of these events may occur in any month. This view has been supported by finding a close agreement between the breeding curves of northern and southern races of the same species, with the significant difference that the maxima are about six months apart, corresponding with the difference in seasons between the two hemispheres. Tropical species, such as the sperm whale, perhaps have no definite breeding period.

Migrations.—The principal movements of many whales are largely connected with the two functions of feeding and reproduction. The humpback, for instance, appears in large numbers in sub-Antarctic waters in the spring (October) and remains there till the summer. As the season advances it becomes less numerous, but it is found off the south and west African coasts at the time that would be expected on the assumption that it is moving northwards. At the height of the southern winter it is found

even as far north as the equator, and it travels southwards again as the spring returns. It is probable that this species, like others, seeks warmer water in which to bring forth its young and that pairing takes place at about the same time. Its journey to the far south is for the purpose of feeding.

Growth and Age.—Little can be said of the duration of life in whales; and statements that large individuals must be of great age may be dismissed as unproven. Young whales may be found accompanying their mothers, and probably subsisting on milk, up to a length of 40 or 50 ft., appearing to imply a growth to that size in the first year. The females of the same species may be pregnant at about 60 ft.; and it has been suggested that a whale reaches the reproductive age very early in life. The condition of the skeleton gives information as to the relative age of whales. Many of the bones of mammals grow at their ends by two bony epiphyses, which are at first separable and in the vertebrae are conspicuous discs of bone. The adult condition, at which growth stops, is reached when the epiphyses have completely fused with the main bones. It was pointed out by Sir William Flower that fusion begins at the two ends of the vertebral column; the cervical and caudal vertebrae commencing the process, which gradually extends from both ends towards the middle. This obviously gives some information as to the relative age of adolescent individuals, but it leaves untouched the question of the duration of life.

Species Hunted.—The whaling industry (*q.v.*) has been mainly based on about nine species, of which all but the sperm whale are whalebone whales. The Basques hunted the Atlantic right whale (*Balaena glacialis*) at an early date, and the industry was specially flourishing in the 12th and 13th centuries. The Arctic fishery began about 1611 and was based on the Greenland whale (*B. mysticetus*). The hunting of the sperm whale (*Physeter catodon*) began about a century later; and the southern right whale (*Balaena australis*) was captured in large numbers by some of the vessels subsequently engaged in this industry. The Pacific grey whale (*Rhachianectes glaucus*) was taken in considerable numbers, on the coast of California, before the middle of the 19th century. Modern whaling depends mainly on two species of rorqual, the great blue whale (*Balaenoptera musculus*) and the fin whale (*B. physalus*) though the Sei whale (*B. borealis*) is not unimportant in certain localities. The humpback (*Megaptera nodosa*) has at times been the most important constituent of the catch of modern whalers, who in one or two localities take a few specimens of Bryde's whale (*Balaenoptera brydei*). The following, of less importance commercially than the great whales, have also been systematically captured by whalers or fishermen at various times:—the narwhal (*Monodon monoceros*), the white whale (*Delphinapterus leucas*), the pilot whale (*Globicephala melaena*), the bottle-nosed whale (*Hyperoodon rostratus*), the common porpoise (*Phocaena phocaena*), and others of the smaller dolphins.

History gives a melancholy record of the results of intensive whaling. The Atlantic right whale is no longer to be found on the Biscay coast, and, though it has made some recovery during the last century, it was believed at one time to have become extinct. The southern right whale, once extremely common on the coasts of South Africa and Kerguelen, and in other localities, is occasionally represented in whaling returns by a very few specimens. The Greenland whale disappeared successively from the bays of Spitsbergen, the Greenland sea, Davis straits and the region of Bering straits. There is no indication of the reappearance of these animals off Spitsbergen or Jan Mayen, where they were formerly present "in immense numbers"; and, though a few probably linger in some of the old localities, the Greenland trade is dead. The Pacific grey whale was nearly exterminated off the coast of California, and was thought to be extinct. It has recently reappeared in small numbers, and a few are being taken by the Japanese in their own waters. The capture of humpbacks has seriously declined. In 1844 the United States alone had 315 vessels employed in the chase of the sperm whale, but one fishing ground after another had to be abandoned. Sperm whales are still taken at whaling stations, off the coasts of Natal and

the British Isles and in the Straits of Gibraltar, but the large fleets formerly engaged in the chase of these animals have ceased to exist. Of the important species, the blue whale, the fin whale, the humpback, the sei whale and the sperm whale alone survive in considerable numbers; and the disappearance of the first two would involve the extinction of the greater part of the industry.

The invention of an improved harpoon-gun in 1865 gave a new impetus to whaling, and this has culminated in the extraordinary success of operations in the dependencies of the Falkland islands and Ross sea. The reintroduction, within the last year or two, of pelagic whaling, by methods far more efficient than those formerly practised, has resulted in new dangers to the whales.

The facts are ominous, and history is likely to repeat itself unless adequate steps can be taken in time. Experience has shown that whales do not readily come back to an old locality, even when they have been free from pursuit for many years. The number of whales recently taken in sub-Antarctic waters has several times exceeded 10,000 in a single season, and in 1925-26 it was more than 7,000 at South Georgia alone. History gives no justification for the belief that whaling can continue indefinitely at this rate, and the necessity of controlling the industry on reasonable lines is urgent.

Commercial Products.—Whalebone, the most valuable product of the Greenland whale, was at one time worth £2,000 a ton. That of the rorquals is shorter and of inferior quality. Oil is produced by all Cetacea, but the sperm oil of the sperm whale and Ziphioids differs in constitution from the train oil or whale oil of other whales. Spermaceti and ambergris are products of the sperm whale. Guano and other materials are obtained by grinding the dried flesh and bones of large whales. Meat of good quality is available from nearly all Cetacea. The flesh of dolphins was formerly esteemed a delicacy; and it had the advantage, in Roman Catholic countries, of being considered fish which could be eaten on fast days. The common porpoise was formerly hunted on a large scale for its meat. Ivory is obtained from the tusk of the narwhal and from the teeth of the sperm whale. Leather can be prepared from the skin of the white whale.

CLASSIFICATION

Suborder 1.—**ARCHÆOCETI.** The *Zeuglodontidae* of the Eocene, constituting this group, are believed to have been derived from the Creodontia, the primitive fossil members of the Carnivora; but Gregory thinks that they may have descended from Insectivora of the type represented by *Pantolestes*. Their skull characters are intermediate between those of their supposed ancestors and those of recent Cetacea in the position of the nostrils, the relations of the maxillae and the dentition, which consists of 3 incisors, 1 canine, 4 premolars, and 3-2 molars on either side of each jaw. The first 4 or 5 teeth are conical and single-rooted, and the other teeth are double-rooted, with serrated crowns. A milk dentition is found.

The recent Cetacea have no milk teeth, and there is no differentiation into incisors, canines and molars. The *Squalodontidae* (Eocene to Pliocene), included in the Odontoceti, are believed to have descended from the Zeuglodonts and to have given rise to some at least of the recent toothed whales. The origin of the Mystacoceti is uncertain.

Suborder 2.—**MYSTACOCETI,** whalebone whales. Whalebone present; teeth wanting in the adult, numerous and vestigial in the embryo; lower jaw large, its halves curved outwards (fig. 5, B) and loosely united in front; blow-holes two longitudinal slits (fig. 2, A); skull symmetrical, the nasal bones relatively well developed, maxillae not covering the orbital plates of the frontals; first pair of ribs alone joining the sternum, which consists of one piece. The females are slightly larger than the males.

Family 1.—*Rhachianectidae*, with *Rhachinectes glaucus*, Pacific grey whale (fig. L, p. 170; 45ft.). Head small, less than one-quarter the total length; dorsal fin wanting; flippers 4-fingered. R. C. Andrews considers *Rhachianectes* the most primitive of the Mystacoceti, in view of the occurrence of long hairs scattered over the entire head and lower jaw, the short and relatively few baleen-blades, the free neck-vertebrae, the large pelvis, and other

characters. The lower side of the throat region has two or three grooves. *Rhachianectes* prefers shallow water, swimming even in the surf and occurs in the North Pacific, from California northwards to the Arctic ocean and off Japan and Korea.

Family 2.—*Balaenidae*. Skull much arched; baleen long and narrow; ventral grooves wanting; neck vertebrae fused.

Neobalaena marginata, pigmy whale (20ft.), is doubtfully placed in this family. It differs from the right whales in its small head, about one-fifth the total length, in its less arched rostrum, in having a dorsal fin and in its 4-fingered flippers. It is known from New Zealand and Australia.

Balaena, right whales. Dorsal fin wanting; flippers broad, with 5 fingers; head one-quarter to one-third the total length.

B. mysticetus, Greenland whale (fig. A, p. 170; 60ft.). Head enormous, one-third the total length; rostrum greatly arched, providing room for exceptionally long baleen, up to 15 feet. Arctic, circumpolar, and formerly abundant off Spitsbergen, both sides of Greenland and the North Pacific to Beaufort sea, but reduced by whaling to the verge of extinction.

B. glacialis, Atlantic right whale or Biscay whale (fig. B, p. 170), about the same size, but differing from *B. mysticetus* in its less arched head, its shorter baleen (up to 9ft.) and the shape of its lower lip. It was formerly common in the Bay of Biscay and it has been recorded from the Mediterranean. It has been hunted, in recent years, off Iceland, Norway and the British Isles. It visits the eastern United States, its northern range in the Atlantic coinciding nearly with the southern limit of the Greenland whale; but, like other right whales, it avoids the tropics.

B. australis, Southern right whale. Resembling *B. glacialis*, but found off Australia, Kerguelen and other parts of the southern sea, where 193,522 were killed by American whalers in 1804-1817. A few are still taken off South Georgia, the South Shetlands and the African coasts. The *Balaena*, hunted in Japan, may be a distinct species.

Family 3.—*Balaenopteridae*, rorquals and humpback. Rostrum less arched than in *Balaenidae*, baleen-blades shorter and broader; dorsal fin present; skin covering the throat with numerous, conspicuous, longitudinal grooves; flippers narrow; neck-vertebrae free. At least 90% of the whales now hunted belong to this family.

Balaenoptera, rorquals. Body relatively slender; dorsal fin well marked; flippers small, narrow and pointed.

B. musculus, blue whale or Sibbald's rorqual (fig. F, p. 170; at least 100ft.) is the largest of all animals and the most important in the estimation of modern whalers. Colour nearly uniformly bluish-grey above and below, including both surfaces of the tail-flukes; baleen jet black, with black fringes. Cosmopolitan, on the assumption that (as in others of the family) the northern and southern races belong to the same species, from polar to temperate seas, occasionally reaching the Equator. Food, small Crustacea (Euphausians, etc.).

B. physalus, fin whale or razor-back (fig. G, p. 170; up to at least 80ft., in the south). Dark above and pure white below, including the lower surface of the tail-flukes. Baleen with alternate, vertical stripes of slate-colour and yellow or white, the fringes similarly light in colour, the anterior 3 or 4ft. of the right series nearly always completely white; lower jaw white on the right side, dark on the left, but the asymmetry of colour of baleen and skin may be reversed. Food, small Crustacea and fishes. This whale is captured in large numbers at most of the whaling stations. Its distribution is as wide as that of the blue whale, but it is rarely found in the tropics. It is common on both sides of the Atlantic, and it enters the Mediterranean. A few are stranded annually on the British coasts.

B. borealis, sei whale or Rudolphi's rorqual (fig. H, p. 170; 52ft.). White and dark parts not so sharply delimited as in the fin whale; lower surface of tail-flukes bluish-grey; baleen black, its fringes white, silky and curling. Temperate parts of all the oceans, not wandering so near the Poles as the two preceding species. Food, Crustacea, less often fishes.

B. brydei, Bryde's whale. Nearly as large as the sei whale, from which it differs in having straight hairs on its baleen-blades, and

SKAPSSKAPS FORHANDLINGEN," (H, L) ANDREWS, "MEMOIRS OF THE AMERICAN MUSEUM OF NATURAL HISTORY"

VARIOUS TYPES OF WHALES

A, Greenland whale (after Scoresby). B, Atlantic right whale. C, sperm whale. D, narwhal (after Scoresby). E, bottle-nosed whale (after Vrolik). F, blue whale (after Sars). G, fin whale (after Sars). H, sei whale. J, lesser rorqual (after Sars). K, humpback whale (after Sars). L, Pacific grey whale (African Elephant, "Jumbo," 11 feet high, reproduced to same scale)

in its food, which consists principally of fishes. South and West Africa, apparently reaching the West Indies.

B. acutorostrata, lesser rorqual (fig. I, p. 170; 33ft.). Coloration as in the fin whale (without asymmetry of colour); a conspicuous white area on the outer side of the flipper. Baleen and its fringes all white or yellowish. Food, largely fishes, but also Crustacea. Temperate and polar latitudes of both hemispheres, including the British and both North American coasts, but not hunted.

AFTER ESCHRICHT AND REINHARDT

FIG. 5.—A. LOWER JAW OF TOOTHED WHALE (ZIPHIIUS, MALE); B. SKULL OF WHALEBONE WHALE (MEGAPTERA) FROM ABOVE

Megaptera nodosa, humpback (fig. J, p. 170; 52ft.). Body thick, dorsal fin evanescent; flippers enormously long, nearly one-third the total length. Colour variable, sometimes nearly all black, but with varying amounts of white in other individuals; flippers sometimes pure white; baleen and its fringes black. Food, fishes and Crustacea. Cosmopolitan, from the Arctic to the Antarctic ocean, and more frequenting warm water than the rorquals. The humpback was almost the only species hunted at the commencement of the great Antarctic whaling enterprise, beginning in 1905, and was almost equally important on the African coasts. The numbers frequenting the whaling localities have greatly diminished.

Suborder 3.—ODONTOCETI, toothed whales. Teeth present throughout life; whalebone wanting; lower jaw more or less triangular (fig. 5, A), the front part often narrow, the two halves firmly united; blow-hole single (fig. 2, B); skull asymmetrical, nasals reduced, maxillae covering the orbital plates of the frontals; several pairs of ribs joining the sternum, which consists, in the young at least, of several pieces.

Family 1.—Physeteridae, sperm whales. Teeth numerous in lower jaw vestigial or absent in upper jaw in recent forms.

Physeter catodon, sperm whale (fig. C, p. 170; 63ft.). Size gigantic; head immense, about one-third the total length; snout enormous, truncated, extended beyond the narrow, ventrally situated mouth (fig. 6, A); lower teeth 20–26 on each side, of great size, up to 4lb. in weight, conical; about 8 pairs of smaller, often malformed, upper teeth; left nasal passage alone developed, the single blow-hole curved, on the upper, left side of the snout, near its front end; dorsal fin reduced to a low hump, continued as a ridge towards the tail; colour black or brown all over, sometimes marked with white, especially in aged individuals. Male up to 63ft., female not often exceeding 35 feet. The sperm whale occurs in all tropical waters, but stragglers, nearly always old males, reach both polar seas. It is polygamous, a school of females being accompanied by one or two large males. The sperm oil produced by this species

AFTER ESCHRICHT AND REINHARDT

FIG. 6.—WHALE HEADS
A. HEAD OF A SPERM WHALE FROM BELOW; B. HEAD OF A KOGIA WHALE FROM THE SIDE

is everywhere mixed with spermaceti, most of which is obtained from a receptacle, the case, occupying much of the snout, to the right of the single nasal passage, and capable of containing nearly 500gal. of mixed oil and spermaceti. The sperm whale dives to a great depth, in pursuit of cuttlefish, its main food, though it also eats fishes. The case is supposed, by its buoyancy, to support the gigantic skull and to facilitate a rapid return to the surface. Ambergris is a morbid concretion of the intestine, commanding a high price.

Kogia, lesser sperm whale (about 10ft.) resembles *Physeter* in general characters, including the position of the blow-hole, the single nasal passage, and the presence of a spermaceti organ; but the head (fig. 6, B) is relatively much smaller. Lower teeth, about 12 on each side, long, delicate, and curved; upper teeth wanting. Indian ocean and coasts of Australia, and recorded from eastern North America, Brittany and Holland.

Family 2.—Ziphiidae, beaked whales. Allied to the *Physeteridae* and producing sperm oil, but teeth much more reduced. A pair of longitudinal grooves in the throat region (fig. 9, A–C). Dorsal fin behind the middle of the body; tail (fig. 7, A) not notched at the junction of the flukes, flippers small; functional teeth (fig. 8, A, B) 1–2 pairs in the lower jaw, generally below the gum in females; minute vestiges of teeth may occur in either jaw. Food, cuttlefish. The rostrum becomes consolidated into a hard, bony mass in *Ziphius* and *Mesoplodon*, and these fragments are found in British late Tertiary deposits.

FIG. 7.—TAILS

A. Tail of Ziphioid
B. Tail of dolphin

Berardius has 2 pairs of large teeth at the front end of the lower jaw (fig. 8, A). *B. bairdi* (40ft.), North Pacific, is the largest Ziphioid. *B. armuxi*, New Zealand, Argentina, not uncommon in Antarctic waters.

Ziphius cavirostris, Cuvier's whale (26ft.) has one pair of teeth at the tip of the lower jaw, much more massive in males (fig. 5, A) than in females, in which they remain beneath the gum. Cosmopolitan, and not uncommon at certain times along the British coasts.

Hyperoodon rostratus, bottle-nosed whale (fig. E, p. 170; male, 31ft.; female, 25ft.). Teeth small, one pair (occasionally two pairs) at the tip of the lower jaw, alike in both sexes, remaining concealed till a late period, but then piercing the gum, at least in old males. Distinguished from *Ziphius* by a large bony crest on the upper side of each maxilla. With increasing age these crests become immense, in the male, producing a notable alteration in the head, the forehead (fig. 9, B) becoming enormous and truncated. Common in the North Atlantic, where it has been extensively hunted to the north of Scotland; and frequently stranded on the British coasts, though rare in the eastern United States. *H. planifrons*, Australia, New Zealand and Argentina.

Mesoplodon (fig. 9, C). Teeth, one pair (fig. 8, B), smaller in females and usually remaining beneath the gum, typically near

FIG. 8.—FRONT ENDS OF LOWER JAWS

A. *Berardius*
B. *Mesoplodon bidens*

the angle of the mouth, but in three species at the tip of the jaw. Of these, *M. mirus* has been stranded on the Irish coast; and *M. pacificus*, described in 1926 from a Queensland skull, appears to be about 25ft. long, and would therefore be the largest *Mesoplodon*. *M. bidens*, Sowerby's whale (15ft.), has its teeth in the typical position (fig. 8, B). Up to 1914 nearly half the records were British strandings, the others being from the Baltic to the eastern United States. *M. layardi*, of South Africa, Australia and New Zealand, has an extraordinary modification of its teeth, which curve over the beak, nearly meeting and preventing the mouth being opened to more than a small extent. *Mesoplodon* is oceanic, like other Ziphioids; but its species (about ten) appear to have a relatively restricted distribution.

Family 3.—Platanistidae. Inhabiting rivers or estuaries. Neck-vertebrae larger than usual, not fused; flippers large and broad, with few phalanges. Food, fishes, captured by probing

SKRIFTER" (DET KONGELIGE DANSKE VIDENSKABERNES SELSKAB, COPENHAGEN); (R, S) W. H. FLOWER IN "TRANSACTIONS" (ZOOLOGICAL SOCIETY OF LONDON); (U) R. COLLETT, "NORGES PATTEDYR" (H. ASCHEROU & CO., OSLO)

COMMON PORPOISE, WHITE WHALE AND TYPES OF DOLPHINS

M, Common Porpoise (after Harmer). N, Common Dolphin (after Flower). O, White-beaked Dolphin (after Harmer). P, *Steno rostratus*. Q, Commerson's Dolphin (after Harmer). R, Bottle-nosed Dolphin. S, Risso's Dolphin. T, Susu (after Anderson). U, White Whale

the mud with the long, narrow jaws, which have numerous teeth; as well as Crustacea and probably other small animals.

Platanista gangetica, Susu (fig. T, p. 172; 8ft.). Blind; dorsal fin reduced; remarkable, large bony crests at the base of the rostrum. Teeth about 30 on either side of each jaw. Ganges, Indus and Brahmaputra, nearly to their head waters.

Lipotes vexillifer (8ft.), with a similar dorsal fin, is whitish all over, its upper jaw curved upwards. Teeth about 32. Tung Ting lake, about 600m. from the mouth of the Yangtse Kiang river.

Inia geoffrensis (8ft.), also with a reduced dorsal fin. The beak is covered with numerous short hairs, a primitive feature. Teeth, 26-32. Amazon river, from near its head waters.

Stenodelphis (or *Pontoporia*) *blainvillei* (5ft.). Dorsal fin well developed; jaws long and delicate; teeth 50-60. La Plata estuary.

Family 4.—Delphinapteridae. Dorsal fin wanting; neck vertebrae free; flippers broad; dermis of skin more developed than usual. Food, mainly cuttlefish, but also fishes.

Delphinapterus leucas, white whale or Beluga (fig. U, p. 172; 18ft.). Adult pure white all over, young dark brown-grey; teeth 8-10, diameter 20 millimetres. Arctic and circumpolar, reaching the St. Lawrence and (rarely) the British coast. Formerly hunted on a large scale.

Monodon monoceros, narwhal (fig. D, p. 170; 15-20ft.). Adult greyish-white, with leopard-like spots, sometimes whitish when old; young unspotted; teeth unlike those of any other animal, reduced (except for vestiges in the foetus) to a single upper pair. In females these remain concealed in the bone, but the left one exceptionally develops as in the male. The right tooth of the male remains similarly concealed, but the left tooth, the horn of the traditional Unicorn, grows spirally to an enormous length, up to 9ft., 4½in., projecting forwards from the upper lip. In rare cases the asymmetry may be reversed, the right tooth becoming the tusk; or the animal has two tusks, about equally developed. One or two "bidental" specimens have been recorded as female, but further evidence on the sex is required. Arctic, rarely reaching Britain. Large numbers of narwhals are killed by the Esquimaux in certain parts of Greenland, where the males protrude their tusks through holes in the ice when they rise to breathe.

Family 5.—Delphinidae, dolphins (fig. 1). Dorsal fin present, except as noted below. Neck vertebrae mostly fused with one another; tail (fig. 7, B) with a notch at the junction of the flukes; flippers generally pointed and sickle-shaped; teeth (except *Grampus*) in both jaws, usually numerous. The numbers recorded below (on either side of each jaw) do not include the reduced teeth commonly found at the front end on both jaws, below the gum.

Delphinus delphis, common dolphin (fig. N, p. 172; 8ft.). Beak about 5in. long in middle line, separated from rest of head by a distinct groove (fig. 10, A), a character obvious in representations of this animal on Greek coins and elsewhere. Mainly black above and white below, the sides with longitudinal streaks of white, brown, yellow or grey. Palate of skull with two deep, longitudinal grooves. Teeth 40-50, diameter 3-3.5 millimetres. The "dol-

phins," which pursue flying fish and change colour when dying, are fishes (*Coryphaena*), not to be confused with the cetacean. Cosmopolitan, common in the Atlantic and Mediterranean, frequently stranded on the British coasts, but rarely on the east side of England. Food, fishes and cuttlefish. The stomach of a Mediterranean specimen was found by Dr. J. Schmidt to contain 15,191 otoliths (ear-bones), indicating the recent consumption of more than 7,500 small fishes.

Prodelphinus, with many species, often spotted or with longitudinal dark lines on the sides, is oceanic. Beak and teeth as in

Delphinus, but palate of skull not grooved.

Lissodelphis peronii. Black and white, sharply delimited, the white including the flippers and continued past the mouth to the upper side of the "forehead." Dorsal fin wanting. Teeth as in *Delphinus*. Southern seas, with one record from New Guinea.

Lagenorhynchus. Beak short, usually distinct (fig. 10, B); sides generally with oblique light areas; upper and lower keels of root of tail strongly marked; vertebrae numerous, about 73-92. The two following British species, also found in eastern United States, reach 9ft., the beak 2in. long in the middle line:—*L. albirostris*, white-beaked dolphin (fig. O, p. 172); upper lip white; teeth 22-25, diameter 7 millimetres.—*L. acutus*, white-sided dolphin; upper lip black; very distinct light areas on the sides; teeth 30-34, diameter 4 millimetres. Other species in Indian, Pacific and Southern oceans.

Cephalorhynchus (fig. Q, p. 172). Small dolphins, about the size of the common porpoise, from southern seas, usually conspicuously coloured and without sharply marked beak. Teeth 25-31, small.

Steno rostratus (fig. P, p. 172; 8½ft.). Mainly dark, spotted with white; beak long, distinct; teeth 20-27, large, with slightly rugose crowns. Atlantic and Indian oceans.

Sotalia. Resembling *Steno*, but teeth more numerous (up to 35), with smooth crowns. Species of *Sotalia* occur in fresh water in China (colour, milky white) and the Amazon. *S. t̄ouszii*, from the Cameroons, has been found to contain leaves, mangrove fruits, and grass in its stomach. Other species, from the tropical parts of the Indian and Atlantic oceans.

Tursiops. Beak rather longer than in *Lagenorhynchus*, teeth larger. *T. truncatus*, bottle-nosed dolphin (fig. R, p. 172; 10-11ft.), is common in British seas and off the eastern United States. Dark above and white below; teeth 20-23, large, diameter 8.5-10 millimetres. Other species from the Mediterranean, Red sea, North Pacific, Australia and New Zealand. The natives of Moreton bay, Queensland, are said to co-operate with schools of dolphins (probably *Tursiops*) in beach fishing, the dolphins driving the fishes ashore and being rewarded for their assistance by fishes offered on the points of spears.

Grampus griseus, Risso's dolphin (fig. S, p. 172; 11ft.). Nearly uniformly greyish; beak wanting, forehead prominent; flippers long; teeth completely absent in upper jaw (except for rare vestiges); lower teeth, 2-7, confined to the front end of the jaw, large, diameter 14 millimetres. Apparently cosmopolitan, reaching Britain and the eastern United States. "Pelorus Jack," an individual which was well known in New Zealand, a few years ago, from its habit of accompanying steamers in Pelorus Sound, is believed to have belonged to this species.

Globicephala. Forehead greatly swollen and prominent (fig. 10, C); flippers specially long. *G. melana*, pilot whale, black-fish or caa'ing whale (28ft.) is black all over. Teeth 7-11, large, diameter 10-11 mm., at the front end of the jaws. Large schools have frequently been driven ashore, 1,540 individuals having been killed in

two hours, in 1845, at the Shetland islands. 117,456 individuals are known to have been captured at the Faeroe islands between 1584 and 1883. Both sides of the Atlantic and in Pacific, Indian ocean and southern seas.

Pseudorca crassidens, false killer (19ft.). Teeth 8-10, almost as large as those of the killer; black all over, flippers narrow. Originally described by Owen from a subfossil skeleton from the Lincolnshire fens. Two skeletons have recently been found in the Cambridgeshire fens. A school of more than a hundred specimens was stranded in the Bay of Kiel in 1861, and a school of about 150 on the east coast of Scotland in 1927. It is said to occur in large

- D. *Phocaena*

parties off New Zealand and Tasmania, and it has been recorded from India, Queensland, both sides of North America and Argentina.

Orcella brevirostris (7ft.). Head as in *Grampus*, dorsal fin low; rostrum of skull very short; teeth 12-14, small. Ascends the Irrawaddy river, Burma, to 900 miles from the sea, and occurs in the Bay of Bengal, and off Singapore and Borneo.

Phocaena and the two following have teeth with an expanded, spade-shaped crown, differing from the conical teeth of other dolphins. *P. phocaena*, common porpoise (fig. M, p. 172; 5½ft.), is black above and white below, with some variation. Head short, without beak (fig. 10, D) dorsal fin triangular, commonly with small, horny tubercles on its front edge. Male reproductive opening unusually far forward, below the dorsal fin; teeth 22-26. The porpoise was formerly much in request as an article of diet, and there were important fisheries off Normandy and at the entrance to the Baltic. It frequents coasts and often ascends rivers. It is specially characteristic of the Atlantic coasts, on both sides, and it reaches the Azores. The porpoise of the Black sea and eastern Mediterranean has been considered distinct. Other species from South America.

Neomeris. Resembles *Phocaena* in having skin-tubercles, but has no dorsal fin. Teeth 16-21. India and Japan (marine); Tung Ting lake and other parts of the Yangtse Kiang, hundreds of miles from the sea.

Phocaenoides, with two species from the North Pacific, also has skin-tubercles. Teeth 19-22, much smaller than in *Phocaena*; vertebrae specially numerous, 95-98, as compared with 64-67 in *Phocaena phocaena*.

Orcinus orca, killer or grampus (male 31ft.; female, 16ft.).—Beak wanting; dorsal fin large; flippers very broad, not pointed; teeth exceptionally large and strong, diameter 2in.; colour-pattern bold, the black and light parts sharply delimited (fig. 1). The white (or yellow) extends over the lower jaw and the lower side of the tail-flukes; and, just behind the dorsal fin, is produced backwards as a lobe defined below by a tongue of black passing forwards from the tail; a conspicuous white area, above and behind the eye; and a less distinct triangular mark behind and below the dorsal fin. The male is nearly twice the length of the female and all its fins increase greatly in size with age, to an extent disproportionate to the body-length. The dorsal fin, at first recurved as in the female, becomes an erect triangle 5½ft. high. The flippers reach a size of 6x4ft., their enlargement being due mainly to the inordinate growth of the cartilage of the phalanges. Food, fishes and marine mammals and birds. Eschricht found the remains of 13 porpoises and 14 seals in the stomach of a killer, and gave reasons for believing that seals are flayed after being swallowed, the skins being then disgorged. The story that killers combine to attack a large whale, forcing its mouth open and eating the tongue, has recently been confirmed by R. C. Andrews. Although a killer should be regarded as a dangerous animal there seems to be little evidence that it willingly attacks man. The motive for a combined assault, by a party of killers, on an ice-floe, as recorded in *Scott's Last Voyage*, may have been the capture of the dogs (mistaken for seals), and not of the man. *O. orca*, if all killers belong to one species, is cosmopolitan, extending from Pole to Pole, though it is apparently not often found in the tropics. It is not uncommon in British and American waters.

Feresa and *Sagmatias* are little known genera.

CETATEA ALBA, a town of Rumania (Akkerman, in old Slav, *Byelgorod*, i.e., white town) in lat. 46° 12' N., long. 30° 19' E., on the right bank of the estuary (liman) of the Dniester, 12m. from the Black sea. The town stands on the site of the ancient Milesian colony of Tyras. Centuries later it was rebuilt by the Genoese and named Mauro Castro. The Turks captured it in 1484. In 1770, 1774 and 1806 the Russians captured it, but each time returned it to the Turks. In 1826 a treaty was concluded here between Russia and the Porte, when Russia secured considerable advantages: the terms of the treaty were not observed and war broke out in 1828. In 1881 it was definitely annexed to Russia, but in March 1918, when Bessarabia was united with Rumania, Cetatea Alba became a Rumanian town. The harbour is too shallow to admit large vessels, but there is a trade in wine, salt, fish, wool and tallow, though this has been hampered recently by the separation from Russia; the proximity to the Russian town of Odessa was formerly its greatest asset. The salt is obtained from the saline lakes (limans) in the neighbourhood. The town and its suburbs contain beautiful gardens and vineyards. It is surrounded by ramparts and commanded by a citadel. Pop. (1914) 33,600.

CETHEGUS, the name of a Roman patrician family of the Cornelian gens. Two individuals are of some importance:—

(1) MARCUS CORNELIUS CETHEGUS, pontifex maximus and curule aedile, 213 B.C. In 211, as praetor, he had charge of Apulia; later, he was sent to Sicily, where he proved a successful administrator. In 209 he was censor, and in 204 consul. In 203 he was proconsul in Upper Italy, where, in conjunction with the praetor P. Quintilius Varus, he defeated Mago, Hannibal's brother, in Insubrian territory, and obliged him to leave Italy. He died in 196. He had a great reputation as an orator, and is characterized by Ennius as "the quintessence of persuasiveness" (*suadae medulla*). Horace (*Ars Poët.* 50; *Epistles*, ii. 2. 117) calls him an authority on the use of Latin words.

See Livy xxv. 2, 41, xxvii. 11, xxix. 11, xxx. 18.

(2) GAIUS CORNELIUS CETHEGUS, the boldest of Catiline's associates, joined the conspiracy in the hope of getting his debts cancelled. When Catiline left Rome in 63 B.C., Cethegus remained behind as leader of the conspirators with P. Lentulus Sura. He undertook to murder Cicero and other prominent men, but was hampered by the dilatoriness of Sura. He was condemned to death, and executed, with Sura and others, on the night of Dec. 5.

See Sallust, *Catiline*, 46-55; Cicero, *In Cat.* iii. 5-7; Appian, *Bell. Civ.* ii. 2-5; see also CATILINE.

CETINA, GUTIERRE DE (1518?-1572?), Spanish poet and soldier, was born at Seville. He served under Charles V. in Italy and Germany, but retired from the army in 1545 to settle in Seville. Soon afterwards, however, he sailed for Mexico, where he spent most of the rest of his life, being killed in a street brawl in Los Angeles. A follower of Boscan and Garcilaso de la Vega, Cetina adopted the doctrines of the Italian school and, under the name of Vandalio, wrote an extensive series of poems in the newly introduced metres; his sonnets are remarkable for elegance of form, but his other productions are mostly adaptations from Petrarch, Ariosto and Ludovico Dolce. His works have been well edited by Joaquín Hazañas y la Rúa (Seville, 1895).

See A. M. Withers, *The Sources of the Poetry of Gutierre de Cetina*, etc. (1923).

CETINJE (Serbian, *Tsetinye*), capital of Montenegro, Yugoslavia, in a narrow plain deep in the limestone mountains, 2,068ft. above the sea. Pop. (1921) 5,473. On one peak stands the white dynastic tomb erected by its last ruler, and on another the old bell tower formerly used for the heads of Turks. The country is bare and stony, with carefully cultivated rich red soil in rock-crevices. Heavy winter snow and spring and autumn floods make communications difficult. Cetinje contains two parallel streets of whitewashed cottages, connected by smaller ones; the church

(1478) of a fortified monastery, visited by pilgrims to the tomb of Peter I. (1782-1830); the old palace, the residence of the late King Nicholas and his heir; the court of appeal; a school; barracks; a seminary for priests and teachers, established by the tsar Alexander II. (1855-81); a library and reading room; a theatre; a museum; a hospital; a bank, and a war memorial. The girls' school founded by the tsaritsa Marie was closed in 1913. The town is lit by electricity. Near the old palace stood the celebrated plane tree beneath which Prince Nicholas gave audience until the end of the 19th century. Near the modern palace, in a glass house, guarded by a sentry, is a contour map of the country, some 60ft. long, on which every fort, town, village, road and stream is depicted. A zigzag highway, a triumph of engineering, winds through the mountain passes between Cetinje and Cattaro, passing the impregnable Mt. Lovćen. Here Peter II. (1830-51), the poet ruler, is buried. He introduced a prison and a printing press, but the latter was soon melted down for bullets. Other roads give access to Rijeka, a steamship station at the head of Lake Scutari, and to Podgorica, both served by diligence. There is, however, little trade, though mineral waters are manufactured. Cetinje owes its origin to Ivan the Black, who was forced in 1484 to withdraw from Zhabliak, his former capital.

CETTE, a seaport of southern France in the department of Hérault, 18 m. S.W. of Montpellier, at the junction of the P.L.M. and Midi railways. Pop. (1926) 35,388. After Marseille it is the principal commercial port on the south coast of France. The port was created in 1666 by the agency of Colbert, minister of Louis XIV., and according to the plans of Vauban; toward the end of the 17th century its development was aided by the opening of the Canal du Midi. The older part of Cete occupies the foot and slope of the conspicuous and isolated Mont St. Clair (590 ft.), situated on a tongue of land between the Mediterranean and the lagoon of Thau. This well-built quarter is bounded on the east by the Canal de Cete, which leads from the lagoon of Thau to the Old Basin and the outer harbour. Across the canal lie the newer quarters, which chiefly occupy two islands separated from each other by a wet dock and bounded on the east by the Canal Maritime, parallel to the Canal de Cete. A lateral canal unites the northern ends of the two main canals. A huge breakwater protects the entrance to the harbour, which is one of the safest in France. The outer port and the Old Basin (the fishing harbour) are enclosed by a mole to the south and by a jetty to the east. Behind the outer port lies an inner basin which communicates with the Canal Maritime. The entire area of the harbour, including the canals, is 111 acres with a quayage length of over 8,000 yards. The public institutions of Cete include tribunals of commerce and of maritime commerce, councils of arbitration in commercial and fishing affairs, an exchange and chamber of commerce. Cete is much resorted to for sea-bathing. The town is connected with Lyons by the canal from the Rhône to Cete, and with Bordeaux by the Canal du Midi. The shipping trade is carried on with South America, the chief ports of the Mediterranean, and especially with Spain. The chief exports are wines, brandy and chemical products; the chief imports are coal, timber, petroleum and chemical substances. Small craft are employed in the sardine, tunny, cod and other fisheries. Shell-fish are obtained from the lagoon of Thau. There are factories for the pickling of sardines, for the manufacture of liqueurs and casks, and for the treatment of sulphur, phosphates and nitrate of soda. The Schneider Company of Creusot also have metallurgical works at Cete, and there are wire-making establishments.

CETUS ("The Whale"), in astronomy, a constellation of the southern hemisphere, fabled by the Greeks to be the monster sent by Neptune to devour Andromeda, but which was slain by Perseus. It contains the long-period variable star Mira Ceti (α Ceti), which was the first star recognized to be variable (by Fabricius in 1596). It usually ranges from the ninth to the third magnitude in about 340 days; but this kind of variation is always rather irregular. It has recently been found to have a companion distant rather less than a second of arc. The companion was first suspected from spectroscopic observations; when looked for visually it was easily seen, but it is difficult to under-

stand why it had escaped notice in a star which was so continually studied. The companion is itself a very interesting star, possessing an unusual type of spectrum with bright lines; it is probably a "white dwarf," like the companion of Sirius. (A. S. E.)

CETYWAYO (d. 1884), king of the Zulus, was the eldest son of King Umpande or Panda and a nephew of the two previous kings, Dingaan and Chaka. Cetywayo was a young man when in 1840 his father was placed on the throne by the aid of the Natal Boers; and three years later Natal became a British colony. Cetywayo had inherited much of the military talent of his uncle Chaka, the organizer of the Zulu military system, and chafed under his father's peaceful policy towards his British and Boer neighbours. Suspecting Panda of favouring a younger son, Umbulazi, as his successor, Cetywayo made war on his brother, whom he defeated and slew at a great battle on the banks of the Tugela in Dec. 1856. In the following year, at an assembly of the Zulus, the management of the affairs of the nation was entrusted to Cetywayo, though the old chief kept the title of king. Cetywayo was, however, suspicious of the Natal government, which afforded protection to two of his brothers. The feeling of distrust was removed in 1861 by a visit from Theophilus Shepstone, secretary for native affairs in Natal, who induced Panda to proclaim Cetywayo publicly as the future king. Friendly relations were then maintained between the Zulus and Natal for many years. In 1872 Panda died and Cetywayo was declared king, Aug. 1873, in the presence of Shepstone, to whom he made solemn promises to live at peace with his neighbours and to govern his people more humanely. These promises were not kept. Cetywayo's attitude became menacing; he allowed a minor chief to make raids into the Transvaal, and seized natives within the Natal border.

Sir Bartle Frere, who became high commissioner of South Africa in March 1877, was convinced that the Kafir revolt of that year on the eastern border of Cape Colony was part of a design or desire "for a general and simultaneous rising of Kafirdom against white civilization"; and in Dec. 1878 Frere sent the Zulu king an ultimatum, which, while awarding him the territory he claimed from the Boers, required him to make reparation for the outrages committed within the British borders, to receive a British resident, to disband his regiments, and to allow his young men to marry without the necessity of having first "washed their spears." Cetywayo, who had found a defender in Bishop Colenso, vouchsafed no reply, and Lord Chelmsford entered Zululand, at the head of 13,000 troops, on Jan. 11, 1879, to enforce the British demands. After the initial disaster of Isandhlwana and the defence of Rorke's Drift the Zulus were utterly routed at Ulundi (July 4). Cetywayo became a fugitive, but was captured on Aug. 28. His kingdom was divided among 13 chiefs and he himself taken to Cape Town, whence he was brought to London in Aug. 1882. While he was in England the Gladstone government decided upon his restoration. Restoration, however, proved to refer only to a portion of his old kingdom. Even there one of his kinsmen and chief enemies, Usibepu, was allowed to retain the territory allotted to him in 1879. Cetywayo was reinstalled on Jan. 29, 1883, by Shepstone, but his enemies, headed by Usibepu, attacked him within a week, and after a struggle of nearly a year's duration he was defeated and his kraal destroyed. He then took refuge in the native reserve, where he died at Ekowe, on Feb. 8, 1884.

His son Dinizulu was exiled to St. Helena (1889-98), and was then allowed to return home and become a chief. He was arrested in Dec. 1907 for alleged complicity in a Zulu revolt, and in Nov. 1908 was tried before a special court. His defence was undertaken by Mr. W. P. Schreiner. The charge of treason was not proved, but he was convicted of harbouring rebels and sentenced to four years' imprisonment.

The Life of Sir Bartle Frere, by John Martineau, vol. ii. ch. 18 to 21, contains much information concerning Cetywayo.

CEULEN, LUDOLPH VAN (1540-1610), Dutch mathematician, was born at Hildesheim on Jan. 28, 1540. His name also occurs as Keulen or Collen. He was professor of fortification at Leyden. Van Ceulen's principal work was the calculation of π

to 35 decimal places. This calculation was considered so important that the number is engraved on his tombstone at Leyden and it is often called Ludolph's number. He wrote *Die arithmetische en geometrische Fundamenten* (1615) and *Van den Circkel* (1596), a second edition of which was edited in 1615 by van Ceulen's widow, who had helped him in his calculations of π ; a third edition in Latin was published in 1619. He died on Dec. 31, 1610, at Leyden.

CEUTA (Arabic SEBTA), a Spanish military and convict station and sea-port on the north coast of Morocco, in $35^{\circ} 54' N.$, $5^{\circ} 18' W.$ Pop. (estimated, 1926), 37,076. It is situated on a promontory connected with the mainland by a narrow isthmus, and marking the south-eastern end of the Straits of Gibraltar, which between Ceuta and Gibraltar have a width of 14 miles. The promontory terminates in a bold headland, the Montagne des Singes, with seven peaks, of which the highest, the Monte del Hacko—the ancient Abilya, one of the "Pillars of Hercules"—rises 636 ft. above the sea.

Ceuta occupies in part the site of a Carthaginian colony, which was succeeded by a Roman colony said to have been called *Ad Septem Fratres* and also *Exilissa* or *Lissa Civitas*. From the Romans the town passed to the Vandals and afterwards to Byzantium, the emperor Justinian restoring its fortifications in 535. In 618 the town, then known as Septon, fell into the hands of the Visigoths. It was the last stronghold in North Africa which held out against the Arabs. At that date (A.D. 711) the governor was Count Julian, who, to avenge a family wrong, invited the Arabs to conquer Spain. By the Arabs the town was called Cibta or Sebta, hence the Spanish form Ceuta. It was repeatedly being captured by rival Berber and Spanish-Moorish dynasties but became, nevertheless, an important industrial and commercial city, being noted for its brassware and its trade in ivory, gold and slaves. It is said to have been the first place in the West where a paper manufactory was established. In 1415 the town was captured by the Portuguese. It passed to Spain in 1580 on the subjugation of Portugal by Philip II., and was definitely assigned to the Spanish Crown by the Treaty of Lisbon in 1688. The town has been several times unsuccessfully besieged by the Moors, one siege, under Mulai Ismail, lasting 26 years (1694–1720). In 1810, with the consent of Spain, it was occupied by British troops, but was restored to Spain at the close of the Napoleonic Wars. As a result of the war between Spain and Morocco in 1860 the area of Spanish territory around the town was increased.

Ceuta consists of two quarters, the old town, covering the low ground of the isthmus, and the modern town, built on the hills forming the north and west faces of the peninsula. Between the old and new quarters, and on the north side of the isthmus, lies the port. The fortifications date from the Portuguese occupation. For civil purposes Ceuta is attached to the province of Cadiz. It is a free port, but does little trade.

CEVA, TOMASSO (1648–1736), Italian mathematician, was born at Milan on Dec. 20, 1648. He taught mathematics at the Jesuit college in Milan, and was a member of the order. While at the Brera college he co-operated with Saccheri in a number of mathematical researches. In 1678 Ceva published some work containing the theorem which is now known by his name and which deals with the concurrency of straight lines through the vertices of a triangle. He died at Milan on Feb. 3, 1736.

CEVA, a town of Piedmont, Italy, province of Cuneo, 33 m. E. by rail from the town of Cuneo, on the line to Savona, 1,270 ft. above sea-level. Pop. (1921) 3,793 (town); 5,836 (commune). The mediaeval fortress (defending the confines of Piedmont towards Liguria) was destroyed by the French in 1800, after cession to them in 1796. Cevan cheese (*caseus cebanus*) was famous in Roman times. A branch railway runs from Ceva through Garesio, with its marble quarries, to Ormea (2,398 ft.), 22 m. to the south through the upper valley of the Tanaro. From Ormea a road runs south to (31 m.) Oneglia on the Ligurian coast.

CÉVENNES, a mountain range of southern France, forming the south and east fringe of the Plateau Central and part of the

watershed between Atlantic and Mediterranean basins. It consists of a narrow ridge some 320 m. long, with numerous lofty plateaux and secondary ranges branching from it. The northern division, nowhere over 3,320 ft., is called the mountains of Charollais, Beaujolais and Lyonnais, from the Col de Longpendu (west of Châlon-sur-Saône) in a southerly direction to the Col de Gier. The central Cévennes, comprising the volcanic chain of Vivarais, incline south-west and extend as far as the Lozère group. The northern portion of this chain forms the Boutières range. Farther south it includes the Gerbier des Joncs (5,089 ft.), the Mont de Mézenc (5,755 ft.), the culminating point of the entire range, and the Tanargue group. South of Mont Lozère, where the Pic Finiels reaches 5,584 ft., lies the range strictly called the Cévennes. This region stretches south to include the Aigoual and Espérou groups. Under various local names (the Garrigues, the mountains of Espinouse and Lacaune) and with numerous offshoots, the range extends south-west and then west to the Montagne Noire. In the south, the Cévennes separate the barren region of the Causses from sunny Languedoc, where olive, vine and mulberry flourish. Northwards the contrast between the two slopes is less striking.

The Cévennes proper are a folded belt of Palaeozoic rocks along the south-east border of the central plateau of France. Concealed in part by later deposits, these folds extend from Castelnau-dary to near Valence, where they sink suddenly beneath the Tertiary and recent deposits of the Rhône valley. Rocks from Cambrian to Carboniferous are included in the folded belt, and the gneiss and schist which form so much of the chain consist, in part at least, of metamorphosed Cambrian beds. The structure is complicated by extensive overthrusting from the south-east. The principal folding is of Hercynian age. Permian and later beds lie unconformably upon the denuded folds, and in the space between the Montagne Noire and the Cévennes proper the folded belt is buried beneath the horizontal Jurassic strata of the Causses. Folding was renewed along the south-east margin at the close of the Eocene period. The Secondary and Tertiary beds of Languedoc were crushed against the central plateau and were frequently overfolded, but the ancient Palaeozoic chain acted as part of the unyielding massif, and the folding did not extend beyond its foot.

The Cévennes form the watershed between the basins of the Loire and the Garonne to the west and those of the Saône and Rhône to the east. In the south the Orb, the Hérault and the Vidourle flow directly into the Gulf of Lyons; farther north, the Gard, the Cèze and the Ardèche flow to the Rhône. The Vivarais mountains and the northern Cévennes approach the right banks of the Rhone and Saône closely, and short torrents flow down to those rivers; on the west side the streams are tributaries of the Loire, which rises at the foot of Mont Mézenc. A short distance to the south on the same side are the sources of the Allier and Lot. The waters of the north-western slope of the southern Cévennes drain into the Tarn. In the Lozère group and the southern Cévennes generally, is good summer pasturage for huge flocks. Silk-worm-rearing and the cultivation of peaches, chestnuts and other fruits are also carried on. In the Vivarais cattle are reared, while on the slopes of the Beaujolais are flourishing vineyards.

CEYLON, a large island and British Crown Colony in the Indian Ocean, separated on the north-west from India by the Gulf of Manaar and Palk Strait. It lies between $5^{\circ} 55'$ and $9^{\circ} 51' N.$ and between $79^{\circ} 41'$ and $81^{\circ} 54' E.$; its extreme length from north to south is $272\frac{1}{2}$ m.; its greatest breadth is $137\frac{1}{2}$ m.; area 25,481 sq.m., five-sixths that of Ireland.

The coast is beset on the north-west by numerous sand-banks, shoals and rocks, and the island of Manaar, which forms an integral part of Ceylon, is almost joined to the island of Rameswaram by the chain of sand-banks named Adam's Bridge (*q.v.*). Of the channels through these shoals, Manaar Passage and Paumotu Passage, the latter is the better though negotiable only by vessels of light draught. The west coast from Puttalam southward, and the whole south coast are fringed by coconut palms which grow almost to the water's edge. Along these shores there are numerous inlets and lagoons, often linked by canals, mostly constructed during the Dutch occupation. The east coast is more rugged and lacks the luxuriant vegetation of the west and south

SCENES IN THE HILLS OF CEYLON

1. Maskeliya, a tea estate lying at the foot of Adam's Peak. This mountain, on which Gautama is supposed to have descended, is visited annually by thousands of Buddhist pilgrims
2. An artificial lake, purely ornamental, in Kandy; one of many small artificial bodies of water found throughout the hills in the north and east of Ceylon

PHOTOGRAPHS, (1, 2, 3) EXCLUSIVE NEWS AGENCY, (4) THE KEYSTONE VIEW COMPANY

COMMERCIAL ACTIVITIES IN CEYLON

1. Colombo. Prince street, the main European shopping centre. The Queen's house and governor's residence are at the end of the street overlooking the sea and harbour
2. Bazaar in Colombo, where the natives do their shopping and trading in the Pettah, or street of the native quarter. The road leads to the old Dutch residential district of Mutwal
3. Canal joining Colombo and Negombo. Commerce is carried on between the two towns by means of this narrow waterway. Paddah boats or native thatched barges are shown passing through the canal
4. Primitive portage, still common in parts of Ceylon. This method of transporting food is used in the small seaside villages, where the usual burden is sacks of rice, staple diet of the natives

of the island. Deep water is usually available close to the shore, though there are a few dangerous rocks, well known to navigators.

Mountains.—A massif occupies the centre of the southern portion of the island covering 4,212 sq.m., the foothills rising from the flat plains 45 to 70 m. from the coast. The highest peak, Pedrutalagala (8,296 ft.), dominates the hill-station of Nuwara Eliya (6,000 ft.); Adam's Peak (*q.v.*) is visible to vessels approaching the harbours on the west coast and from Colombo. This massif intercepts the rains of both monsoons, whereas the arid "dry zone," which extends northward uninterruptedly from the neighbourhood of Dambulla, was only rendered habitable by a large population in ancient times by one of the most elaborate and skilful irrigation systems ever devised. This fell into disuse and, though much restoration work has been undertaken during the period of the British occupation of Ceylon, malaria has hitherto defeated all attempts to colonize this area anew. The rainfall of the south-west is far heavier than that of the north-east monsoon, and as a consequence the western and southern districts near the mountains are far more fertile than those on the east side. Practically the whole west side of these mountains, up to an altitude of 5,000 ft., is to-day under tea; but on the eastern flanks the natural forest of the west and south slopes is replaced by rolling downs of rank grass strewn with great boulders. These are termed *patnas*, and till recently were regarded as unsuitable for tea; large areas have now been converted into tea-estates. At the time of the conquest of Kandy (1815) the mountains were covered with virgin forest; the Kandyan villagers had their homesteads in the deep valleys, and cultivated rice on any available flat ground and also on terraces cut out of the hillsides to a height of only a few hundred feet above the valley-levels.

The plateau of Nuwara Eliya, the famous health-resort, is 6,000 to 6,200 ft. above sea-level. It enjoys an almost perfect climate from September to April, though even during those months rainy days are common. From May to August rain falls almost daily. The Horton Plains (7,000 ft.), though they have not so far been extensively developed and are mainly used by anglers, possess an even more invigorating climate than that of Nuwara Eliya. The other principal hill stations in Ceylon are Badulla, Bandarawela, Diyatalawa, Hatton and Kandy (*q.v.*).

Rivers.—The largest river is the Mahaweli Ganga which, draining the west slopes of the mountains, falls into the sea at Trincomalee, on the east coast, after flowing for a distance of 206 miles. Like all rivers of Ceylon, it is navigable only in the lower

THE GOLD DUST DAGOBA AT ANURADHAPURA, ANCIENT CAPITAL OF CEYLON
Dagobas are pyramidal structures built with sun-dried bricks, and usually contain a relic of the Buddha or of a Buddhist saint.

reaches, where tobacco and other crops are grown by Sinhalese and Tamil cultivators. Its rapid-beset course is a scenic feature near Kandy and in the botanic gardens of Peradeniya, the finest in the tropics. The Kala Ganga falls into the sea at Kalutara, and the Kelani Ganga debouches near Colombo. Against the latter's floods considerable engineering-works have of late been constructed. In the northern part of the island many water-courses are dry most of the year, but all rise in sudden spate after heavy rain. The lakes which abound in north and east Ceylon are all in some measure, and many entirely, artificial. Of these the largest

is Giant's Tank (6,000 ac.), in the Northern Province; Minneri and Kalawewa, in the North Central Province, are about 4,000 acres each.

Trincomalee, on the east coast, is one of the finest natural harbours in the world. Galle was the principal harbour of Ceylon on the west coast until Colombo, by elaborate harbour-works which were begun towards 1880, was made the chief port of the island.

(H. CL.)

Geology.—The greater part of the island is occupied by ancient crystalline rocks in which pyroxene-gneisses are intrusive in the

BUDDHIST SHRINE ON THE SUMMIT OF ADAM'S PEAK, SHOWING THE CLEFT IN THE ROCK THAT IS ATTRIBUTED BY BUDDHISTS TO THE FOOTSTEP OF BUDDHA

older ortho-gneisses and belong to the Charnockite series of Southern India. They are characterized by enstatite and a varying proportion of monoclinic pyroxene, hornblende and biotite. Typical Charnockite is a quartz-plagioclase-enstatite granite. By increase of ferro-magnesian minerals the rocks graduate into noritic varieties, rich in garnet. Except in the centre of some of the larger intrusive masses the rocks show marked mineral banding and granulitic structure. Veins and sills of pegmatite are common and frequently contain compounds of thorium and uranium as accessory minerals. A narrow band of Tertiary sediments borders the north-west coast and forms the Jaffna peninsula in the north. A small outlier

of the same rocks is found on the south coast. Recent deposits of sand, mainly the result of marine agencies, fringe the rest of the coast as sand-bars enclosing lagoons and coastal flats, while the river valleys are filled with recent alluvium. In the low country the crystalline rocks are generally overlain by a thick mantle of laterite, resulting from their decomposition. The economic minerals of importance are—(1) graphite (plumbago) (2) gemstones. Graphite is found in veins which may be regarded as a special type of pegmatite. The principal mines lie in groups in the south-west quarter of the island. The gem-stones, the most important of which are sapphire and other varieties of corundum, are won almost entirely from river-gravels. The gem-fields lie on the south-west flank of the main mountain-mass.

Climate.—The south-west and north-east monsoons are the distinctive feature. The former is very regular in its approach, appearing along the south-west coast between May 10 and 20; the latter reaches the north-east coast between the end of October and the middle of November. The south-west monsoon brings rain to the western and southern coasts but does not reach the opposite side of the island. The mountains of the south-west sharply mark the wet and dry regions. The influence of the north-east monsoon is more general. The mountains in the north-east are lower and farther from the sea than those on the south-west, and rain is carried farther inland, giving general precipitation. The length of the day, owing to the proximity of the island to the equator, does not vary more than an hour at any season. Colombo is situated in 79° 50' 45" E., and the day is further advanced there than at Greenwich by 5 h. 19 m. 23 s.

Flora.—On sandy shores a screw-pine (*Pandanus tectorius*), *Clerodendron inerme*, *Scaevola frutescens*, *Cerbera manghas*, *Thespesia populnea*, *Dolichandrone spathacea*, *Ipomoea pes-caprae*, *Spinifex littoreus*, *Lippia nodiflora* and *Crinum asiaticum* are common. On muddy shores, a mangrove formation with *Bruguiera conjugata*, *B. sexangulata*, *Rhizophora conjugata*, *R. mucronata*, *Sonneratia acida*, *Avicennia marina*, *Ceriops tagal*, *Aegiceras corniculatum*, *Lumnitzera racemosa* and *Acanthus ilicifolius* is found.

On the south and west coasts the Coconut palm has been extensively planted, while on the north it is replaced by the Palmyra

palm (*Borassus flabellifer*), but neither of these is a native of Ceylon.

In the dry north and east occur *Salvadora persica* (the Mustard tree of Scripture), *Azima tetraacantha*, *Acacia eburnea*, *Carissa spinarum*, *Ziziphus Jujuba* and *Randia dumetorum*, in the low-growing scrub-jungle near the coast. Further inland are forests with valuable timber trees, Satin-wood (*Chloroxylon Swietenia*), Ebony (*Diospyros Ebenum*), Tricomalee wood (*Berria cordifolia*), Milla (*Vitex pinnata*), Ranai (*Alseodaphne semecarpifolia*), etc. The beautiful Indian Laburnum (*Cassia Fistula*), *Crataeva Roxburghii*, *C. auriculata* (which yields the Ranavara Tea), *Derris scandens* (like a white Wistaria) and *Ixora coccinea* are conspicuous. The Riti or Upas tree (*Antiaris toxicaria*), the bark of which was formerly used by the Veddas for making clothing, is found in this part of the island. Herbaceous plants belong mainly to the families Leguminosae, Acanthaceae, Scrophulariaceae, Asclepidaceae and Cucurbitaceae. Ferns and orchids are comparatively rare.

The wet south-west and its affinities has mainly Malayan affinities, but with local species. The trees grow much higher than in the dry zone. Forty species of Dipterocarpaceae are confined to this region, and species of *Palaquium* (Sapotaceae), *Calophyllum* (Guttiferae) and *Diospyros* are also numerous. These forests produce the valuable woods Nedun (*Pericopsis*) Mooniana and Calamander (*Diospyros quiesita*). The few herbaceous plants in the forests are mainly Rubiaceae, Acanthaceae and ferns. The Wesak flower (*Dendrobium Macarthiae*) among orchids and the ribbon fern (*Ophioglossum pendulum*) are the most interesting of the epiphytes, which though more numerous than in the dry zone are less common than in the montane zone. The curious pitcher-plant (*Nepenthes distillatoria*) and the beautiful *Burmannia disticha* are common in open marshy places. *Acrostichum aureum* is a conspicuous fern in similar places, especially near the sea. *Helminthostachys zeylanica* a curious fern related to the Moonwort is found on wet sandy soil.

At higher altitudes the trees are smaller and usually flat-topped with numerous species of *Syzygium*, *Elaeocarpus* and *Lauraceae*; *Calophyllum Walkeri*, *Michelia nilagerica*, *Meliosma Arnottiana* and *Gordonia zeylanica* are ornamental. The undergrowth consists chiefly of various species of *Strobilanthes*. Climbing plants are less common than in the low country but include the lovely rose-red *Kendrickia Walkeri*. Many shrubs and herbs belong to genera represented in England, e.g., bramble, violet, butter-cup, sundew and ladies' mantle.

Tree-ferns and filmy-ferns are especially noticeable; mosses, liver-worts (except *Lejeuneae*) and many families of lichens are more abundant than at lower elevations; orchids are also common, the daffodil orchid (*Ipsea speciosa*) and the hyacinth orchid (*Satyrium nepalense*) are found on the ground on the patanas, while the lily-of-the-valley orchid (*Eria bicolor*), *Dendrobium aureum* and *Coelogyne odoratissima* are common epiphytes. Large open tracts of grass, called *patanas* and *talavas* by the Sinhalese, originally produced by periodic burning of the forest, are gradually extending. In the dry zone they have coarse grasses like *Aristida setacea*, *Heteropogon contortus*, and, about Batticaloa, of *Iluk* (*Imperata cylindrica*). In the wet zone up to about 5,000 ft. they consist mainly of mana grass (*Cymbopogon confertiflorus*) a fern (*Gleichenia linearis*) often with a few stunted trees such as the Patana oak (*Careya coccinea*). Above this elevation the grasses are mainly *Arundinella villosa*, *Chrysopogon zeylanicus*, and *Ischaemum ciliaris* var. *longipilum*; herbaceous plants are more numerous, the purple osbeckias being especially noticeable. *Rhododendron arboreum*, with large red flowers, is the only woody plant common on the patanas at this elevation. Large numbers of foreign species include *Lantana aculeata*, found everywhere along roadsides and on the patanas, the water-hyacinth (*Eichhornia crassipes*) blocking the irrigation channels of the rice fields in the low moist zone, *Mikania scandens* and *Ageratum conyzoides*. Timber trees like Jak (*Artocarpus integrifolia*) and Sapu (*Michelia champaca*) are also of foreign origin.

Fauna.—The elephant of Ceylon is considered a local subspecies of the Indian form, with tusks rarely developed. Elephants

are still numerous in wilder parts, though much scarcer than when the greater part of the island was under forests. They are found at all elevations up to 7,500 feet. At intervals, a herd is driven by an army of beaters into a strong stockade or kraal in the jungle. Each is then noosed with the aid of tame elephants, and tied to trees by the legs. After a short period of discipline they become reconciled, but many captives die within a year. Tame elephants are used in building operations, transporting machinery etc., but chiefly in ceremonial processions.

The small oxen are hardy and capable of drawing heavy loads. Buffaloes (*Bubalus bubalis*) are common, wild and tame. Tame ones plough rice fields and tread out grain but otherwise lead a semi-wild life.

Ceylon possesses four deer—the Sambhur or "Ceylon Elk" (*Rusa unicorn*), the Spotted Deer (*Axis axis*), the Muntjac or "Barking Deer" (*Muntiacus malabaricus*) and the Hog Deer (*Hyelaphus porcinus*), the last probably introduced by the Dutch. A little Chevrotain, the "Mouse Deer" (*Moschiola meminna*), is also common. There are no antelopes in Ceylon.

There are five species of monkeys, one the small Rilawa (*Macacus sinicus*) which is found everywhere, and four known by the name of "Wanduru" (*Pithecius ursinus*, *P. vetulus* and subspecies, *P. philbricki* and *P. priam*). The only other member of the Primates is the little Slender Loris (*Loris tardigradus*) which creeps about the trees at night, and feeds on small birds, insects and fruit. Twenty-four Chiroptera have been identified: the large fruit eating bat or "Flying-fox" (*Pteropus giganteus*) roosts in large colonies in tall trees, often choosing those on small islands. At night it does much damage in mango groves, etc.

The tiger is not found in Ceylon, but the leopard (*Felis pardus*) and several smaller wild cats are common. The only carnivore ordinarily dangerous to man is the Sloth Bear (*Melursus ursinus*) found in the wilder parts. Jackals (*Canis lanka*), Otters (*Lutra lutra*), Palm Cats (*Paradoxurus*) and several species of Mongooses are common. Rats and Squirrels of many species are found, also a Porcupine (*Acanthion leucurus*) and a Hare (*Lepus singhala*). The Dugong (*Hallicore dugong*) occurs in the shallow seas to the north and north-west of the Island and is captured for food to some extent. The only representative of the Edentata is the Pangolin (*Manis crassicaudata*).

Some 372 species of birds are recorded, about 120 being winter migrants from Asia, and 50 others accidental or occasional visitors. About 60 species or subspecies of resident birds are more or less distinct from the nearest Indian forms. Among these endemic species, the more noteworthy are the Ceylon jungle-fowl (*Gallus lafayetii*) the blue magpie (*Cissa ornata*), the yellow-eared bulbul (*Kelaertia penicillata*), the grey-headed babbler (*Turdoides cinereifrons*), the red-faced malkoha (*Phaenicophaeus pyrrhocephalus*), the green-billed coucal (*Centropus chlororhynchus*) and Legge's flowerpecker (*Acmonorhynchus vincens*). The avifauna of the high rainy south, includes most endemic species and shows a close affinity to that of the Travancore hills, while the birds of the dry, flat north are more like those of the Carnatic. Bulbuls, babblers, barbets, kingfishers and crows of many kinds are ubiquitous. Thrushes, flycatchers, chats, drongos, mynahs and sunbirds are all well represented, while cuckoos, parrots and woodpeckers are many and varied. Hawk-eagles, hawks and owls are numerous in species. Pigeons of many kinds, and game birds are common, the latter including peafowl, junglefowl and two species of francolins. The large artificial lakes in the dryer parts of the island are frequented by large numbers of herons, storks and other waders, and by resident and migratory species of teal, etc. Terns form the principal element in the sea fowl, the few species of gulls being winter visitors only, as are also nearly all the snipes, plovers and shorebirds.

Probably the only kinds of poisonous snakes to be feared are the Cobra (*Naja tripudians*) and the "Tic Polonga" or Russell's Viper (*Vipera russelli*). Other venomous species are either very slightly so or very rare. The Python or Rock Snake (*Python molurus*) is found in the jungles and Rat Snakes (*Zaocys mucosus*), and Green Whip Snakes (*Dryophis mycterizans*) are common.

Two species of crocodiles occur, *Crocodilus palustris*, in the large artificial lakes in the interior, and the larger *C. porosus*, in the larger rivers and estuaries. Both are becoming reduced in number as they are much shot for their hides. The large terrestrial Monitor or "Tallagoya" (*Varanus bengalensis*) is suffering a similar fate, and its larger relative, the aquatic "Kabagaroya" (*Varanus salvator*) has had to be protected by law. The commonest lizards are several species of the genus *Calotes*, known as "Bloodsuckers." There are also many Skinks and Geckoes, but the flying lizards (*Draco*) are unrepresented.

Some thirty-seven species of frogs and toads are recorded. The only other Amphibian is the legless Caecilian, *Ichthyophis glutinosus*. (J. Pn.)

Population.—The estimated total population of Ceylon in 1927, inclusive of military and shipping, was 5,125,000, as against 1,700,000 in 1857. The increase during the decade 1911 to 1921 was 395,000 or 9.6%. The population of Colombo was 244,163.

The population and area of the nine provinces was as follows:

| District | Population | Area in square miles |
|--------------------------|------------|----------------------|
| Western province . . | 925,342 | 1,432 |
| Central province . . | 623,011 | 2,287½ |
| Northern province . . | 341,985 | 3,429½ |
| Southern province . . | 566,925 | 2,146½ |
| Eastern province . . | 174,288 | 3,848½ |
| North-Western province . | 353,845 | 3,016 |
| North-Central province . | 79,110 | 4,008½ |
| Province of Uva . . . | 192,072 | 3,272½ |
| Province of Sabaragamuwa | 321,755 | 1,892½ |
| | 3,578,333 | 25,331½ |

The table of nationality gives the principal groups as follows:—

| | |
|----------------------------------|-----------|
| Europeans | 9,509 |
| Burghers and Eurasians | 23,539 |
| Low-Country Sinhalese | 1,458,320 |
| Kandyan Sinhalese | 1,089,097 |
| Tamils | 953,535 |
| Moors (Mohammedan) | 228,706 |
| Malays | 11,963 |
| Veddahs | 3,871 |

Altogether there are representatives of some seventy races in Ceylon. The Veddahs, who live in rock-shelters and run wild in the woods, are the aborigines.

Education.—In 1926 there were in the island 272 English schools attended by 50,114 scholars, of whom 11,703 were girls; 112 Anglo-Vernacular schools, with 23,809 scholars, of whom 4,995 were girls; 4,009 Vernacular schools, with 409,827 scholars, of whom 150,104 were girls. Government schools of these classes numbered respectively 17, 60 and 4,009; grant-in-aid schools 226, 36 and 1,823; unaided schools 29, 16 and 1,085. Grants-in-aid defray practically all current expenses, including salaries of teaching staffs of non-Government schools. Such technical and agricultural schools as exist are sparsely attended. A large class of semi-educated youths, despising manual labour but unfit for clerical work adds annually to the number of idle malcontents. In 1921 the number of literates in the island was 1,537,594 of whom 381,475 were females, and the number of English literates 144,509 of whom 37,213 were females.

Language.—Sinhalese is spoken by about two-thirds of the population. Tamil is used alike by more than half a million Ceylonese Tamils, by Ceylon and Indian Moormen, who number about 290,000, and by the Tamil immigrant labourers, a floating population of about 700,000 souls. A Batavian dialect of Malay is spoken by descendants of Malayan troops imported by the Dutch. An archaic corrupt form of Portuguese is in use among descendants of the earliest European invaders. The aboriginal Veddahs speak a language of their own, the affinities of which are obscure. No worthy dictionary of Sinhalese exists, but one has recently been begun by the Ceylon branch of the Royal Asiatic Society, with funds voted by the Legislative Council. Sinhalese is an Aryan language closely related to Pali (*q.v.*). Though minor dialectal differences occur, the spoken language is practically the same throughout Ceylon. Sinhalese possesses little literature of

value, Pali having been used for the composition of the famous chronicle of the Mahawansa and for most of the poems, etc., of any merit written in Ceylon. Many of these, however, have been translated into Sinhalese.

Religion.—According to the census of 1921, the population of Ceylon was composed of Buddhists 2,769,805, Hindus 982,073, Mohammedans 302,532, Christians 443,400, of whom 368,499 were Roman Catholics, 44,730 Anglicans, 17,345 Wesleyans, 3,536 Presbyterians, 3,511 Baptists, 1,165 Salvationists, 933 Congregationalists and 3,681 of other denominations. Buddhism, the predominant religion was introduced by the 3rd century B.C. The large Buddhist priesthood from time to time has produced many learned men; but the natural religion of the peasantry still finds expression in many observances, probably of pre-Buddhist origin. Ceylon Buddhism moreover recognizes many Hindu gods and goddesses. A great revival of Buddhism in the last 20 years is political rather than religious and accretions have come in from other creeds. Christian practice has prompted Young Men's and Young Women's Buddhist Associations and Islam the doffing of shoes on entering Buddhist Temples. Simultaneously the broad toleration of other faiths, which from the earliest times has been so marked and so noble a feature of pure Buddhism, has shown a tendency to be replaced by vulgar abuse of the tenets of other creeds of a kind with which the more ignorant types of Christian missionaries "to the heathen" have unhappily made the world familiar. The simple faith of the people leads enormous numbers of pilgrims to the principal shrines and temples at each full moon, and to the universal observance of such Buddhist feasts as Wesak, the birthday of Gautama. Adherence to Buddhism, however, has done nothing to wean the Sinhalese as a whole from the consumption of alcohol, though there is now among educated Sinhalese and Tamils alike a vigorous temperance movement. The large number of crimes of violence among the Sinhalese shows that Buddhist teaching has not succeeded in imbuing them with a sense of the sanctity of human life; while, though they for the most part hesitate to take animal life, their treatment of domestic animals is cruel and callous in the extreme.

Agriculture.—The natural soils are composed of quartzose gravel, felspathic clay and sand, often of a pure white blended with or overlaid by brown and red loams, due to decay of vegetable matter, or disintegration of gneiss and hornblende formations. The whole consists of a sandy and calcareous soil admixture, which in ancient times yielded large crops of rice and other food-stuffs, owing to an elaborate system of irrigation, but which to-day is for the most part uncultivated, this part of Ceylon supporting a degenerate and dwindling population. Only in the Jaffna Peninsula, and to some extent in Manaar, where indefatigable Tamil industry irrigates the soil by water drawn from wells, and where the cultivation is intensive, are crops of grain, tobacco and vegetables annually wrung from the ungrateful earth. A little further to the south lie extensive plains of alluvial soil, washed down from the mountains. The soil of the maritime provinces is sandy, but large tracts of quartzose sand along the shore are very suitable for coconut and cinnamon cultivation. The former is rapidly extending, the latter has diminished. From this light sandy belt as far as the foothills, the land is mainly composed of flats which yield large rice-crops, and of low hilly undulations, large areas of which up to a height of some 2,000 ft. are now under rubber, introduced towards the end of the nineteenth century. The soil of the mountain area, though frequently containing great quantities of quartzose sand and ferruginous clay, is often of a fine loamy character, suitable for coffee and for tea-cultivation. The south and west sides of these mountains have been cleared of forest up to a height of 5,000 ft., and in a few instances above that level; and until quite recently very little was done to check or control the erosion of the soil annually caused by the abundant rainfall. In the low country large extents of land formerly under tea are now converted into rubber estates, tea of the best quality being obtainable only at higher altitudes. Over 442,000 acres in the island are now under tea, about 475,000 acres under rubber, 900,000 under coconuts and about 834,000 acres of "wet" land under rice, about 35,000 acres under cocoa, 25,000

under cinnamon, 24,000 under tobacco, 68,000 under areca-nuts and about 6,300 under cardamoms.

Products.—In 1926 the quantities of these articles exported from Ceylon were: Tea, 217,083,648 lb. valued at R213,063,798; Rubber, 131,840,505 lb. valued at R170,078,219; Products of the coconut-palm valued at R79,146,085 of which copra amounted to 2,419,398 cwt. valued at R39,848,479 and coconut-oil to 7,099,095 gallons valued at R15,489,320; Cocoa 64,751 cwt. valued at R1,953,684; Cinnamon chips 11,874 cwt. and Cinnamon quills 31,238 cwt. valued at R4,209,771; Tobacco, manufactured 13,762 lb., unmanufactured 1,972,754 lb. valued at R456,717 lb.; Cardamoms, 2,845 cwt. valued at R841,961; and Areca-nuts, 165,475 cwt. valued at R4,247,825. There were also exported 1,431,351 lb. of citronella oil. As regards rice, so far is Ceylon from being self-supporting that of this, the staple article of food-consumption, 650,964 cwt. valued at R3,305,624 were imported in 1926.

The prosperity of Ceylon depends entirely upon its agriculture. Its principal industry of this nature, other than the rice, coconut and fruit produced by the indigenous population, was coffee-planting, introduced by British planters shortly after 1815. The bulk of the coffee was cultivated on estates under European management and financed by European capital, but considerable quantities were also grown by the indigenous population. Towards 1880 the coffee then covering vast areas, principally in the hill-country, was stricken by leaf-disease. Cinchona and other crops were tried as a substitute, and eventually tea. In a couple of decades it had equalled, and presently outstripped, the coffee-industry, and even at the present time, when many of the low-lying tea-estates have been converted into rubber plantations, it covers a larger area than was ever under coffee. Rubber was introduced during the closing years of the 19th century, and, unlike tea, has found great favour with Ceylonese agriculturists and capitalists. It to-day covers in the aggregate a larger area than tea. None the less, the principal native agricultural industries continue to be coconuts and rice.

(H. CL.)

HISTORY

This island was known to Brahmanical literature under the name of *Lanka*, to the Greeks and Romans as *Taprobane*, to the

BY COURTESY OF THE CANADIAN PACIFIC STEAMSHIPS
RACING BULLOCK CART IN CEYLON DRIVEN BY A NATIVE DRESSED IN LOCAL MALE FASHION. HE WEARS A SKIRT, AND A COMB

Mohammedan seamen and merchants, who for so long had a monopoly of the sea-borne trade of the Indian ocean, as *Serendib*, which it has been suggested is a corruption of the Sanskrit *Sinhala-dvīpa*, and to the Portuguese as *Zeylan*, from which is derived its modern name. The presumed aboriginal inhabitants of the island were the people to-day called Veddahs, a few of whom still occupy certain rock-shelters in the eastern Province of the island. A careful and scientific examination of these people was made in 1910 by Professor and Mrs. C. D. Seligman. Though their language is said to have certain Indian affinities, they seem

ethnologically to be related to the rather lightly coloured, wavy-haired race which is found surviving as somewhat the higher of the two principal aboriginal races in many parts of south-eastern Asia. The Veddahs are probably related to the *Sēman* or *Pangan* of the Malay peninsula and the Andaman islanders. Of the latter race, however, no trace has ever been found in Ceylon. The Veddahs are regarded by the Sinhalese as of *goigama*—viz. husbandman—caste.

The great Hindu epic, the *Ramayana*, tells of the conquest of the greater part of the island by the hero Rama who, with his army, crossed Adam's bridge (*q.v.*) by the aid of the monkey god *Hanuman* and his host, the object of his invasion being, as in the case of *Menelaus*, the recovery of his wife, Sita, who had been abducted by *Rawana*, king of Lanka. The invaders would appear to have penetrated deep into the heart of the *massif* which occupies the centre of the southern portion of Ceylon. Unlike most oriental countries, Ceylon can boast a written history of considerable antiquity, the *Mahavamsa*. This chronicle tells of the landing of Vijaya, the first Sinhalese king, in 504 B.C., accompanied by a small band of Aryan-speaking followers who must, it is thought, have sailed from some point on the northern or north-eastern shores of the bay of Bengal, since the greater part of southern India has, from time immemorial, been inhabited by people of Dravidian stock. Vijaya married a local princess—quite possibly a Veddah—and is said to have become the king of all Ceylon. It is noteworthy that, until the Sinhalese had been driven from out the flat plains north of Dambulla by successive invaders from southern India, they appear never to have attempted to populate at all densely the forest, which of old covered the hills and valleys of the central *massif* and the rich, moist areas in the plains immediately surrounding it. Instead, they established themselves throughout the vast, flat, arid country to the north of Dambulla, which extends to Puttalam on the west, to Kalkuda, some 20m. north-north-west of Batticalao, on the east, northward to Point Pedro in the Jaffna peninsula, and north-west to Talaimannar. This country (Pihiti was its ancient name) they rendered capable of supporting a considerable population by the construction of one of the most elaborate irrigation-systems ever attempted by mankind. It may, however, safely be concluded that Ceylon is to-day more thickly populated than it has been at any previous period of its history.

The Sinhalese kings had long been established at Anuradhapura, though their earliest capital was at Raja-Ratta, when in 307 B.C. the island was visited by Mahinda, a Buddhist priest and a son of Asoka, who is piously believed to have reached Mihintale from his father's capital, Magadha, accompanied by a few disciples, by levitation. A branch of the sacred Bo-tree, seated beneath the shade of which Gautama attained to Buddha-hood, was imported from Magadha and planted at Anuradhapura in 288 B.C.; it is therefore 2,200 years old. Tradition tells that Gautama himself visited Ceylon, in the course of his ministrations, on three occasions, the last descent being on Adam's peak (*q.v.*). Though he is said personally to have undertaken the instruction of the people, there is nothing to show that Buddhism won any foothold in Ceylon until the beginning of the 3rd century B.C. From that time onward, however, up to the present time, it has been the religion to which the vast majority of Sinhalese adhere, though in Maka-Sen (A.D. 275) Ceylon had its Julian the Apostate, and its Messalina in queen Lila-Watti (A.D. 1202). Buddhism is essentially a tolerant, non-proselytizing philosophical system, but it has assumed in Ceylon since 1912 an aggressive militant tone, borrowed from the most ignorant and tactless of Christian missionaries; and the peculiar imitative quality, which is so marked a Sinhalese characteristic, has displayed itself in this and in the establishment of young men's and women's Buddhist associations, etc. The word *Mahavamsa* means *The Genealogy of the Great* and, as was to be expected, the priestly chroniclers, who wrote in Pali, a tongue not understood by the people, had nought to say about them. They also tell with apparent fidelity the long, tangled story of successive murderous strivings for the throne and of the frequent invasions of northern and central Ceylon by princes and armies of southern India, one of which led to the

usurpation of the throne of Anuradhapura for a period by the Tamil Elala, who was slain by the Sinhalese king and saintly hero Dutegemunu (c. 190 B.C.). The ruins of Anuradhapura, as we know them to-day (they were buried in jungle and completely deserted and neglected until about 1845) are interesting but disappointing, in that it is not easy to reconstruct from them any very vivid picture of the city in its prime. The upper

THE TEMPLE OF THE SACRED TOOTH AT KANDY, CEYLON

The tooth in this temple is said to have belonged to the Buddha, although the Portuguese claim to have captured the original tooth during their suzerainty over Ceylon (1517-1600), and to have burned it in the market-place of Goa

structures were of timber, and all have long ago perished, leaving only the foundations for the instruction of archaeologists. The massive *dagobas*—the pyramidal structures which are veritable hills laboriously constructed of small sundried bricks—and some of the buildings of Polonnaruwa are in a somewhat better state of repair. Both these ancient capitals, which had for centuries been completely deserted and surrendered to the jungle by the Sinhalese, have become under British rule places of monthly pilgrimage to which hundreds of thousands of pious Buddhists annually resort. A great deal of archaeological and epigraphical work has been done during the last 50 years by the archaeological department established by Sir William Gregory (1872-77); but the history of Ceylon under its Sinhalese kings is mainly a chronicle of royal crimes, virtues and delinquencies; of the long drawn out struggle with invading princes and armies from southern India, and of internecine strife between the Sinhalese kings of Pihiti (viz., northern Ceylon) and the chiefs of Rohuna and Maya-Ratta, the two districts or provinces into which the then sparsely populated southern portion of the island was divided. The last great revival of the glory of Sinhalese monarchy took place under Prakrama Bahu who was crowned king of Pihiti in 1153 at Polonnaruwa, and in 1155 king of all Lanka, after successful war against Rohuna. His reign is lovingly styled "The Golden Age of Lanka" by the past-praising Sinhalese of to-day; but his wars, his invasion of Pegu in Burma and of the Pandyan country in southern India, his enormous activity as a builder of non-remunerative works, such as his palace with its reputed 4,000 apartments, dancing-halls, *dagobas*, monasteries and temples, as well as his construction and restoration of innumerable irrigation tanks, must have imposed an almost unendurable strain upon the energies of his subjects. Fanatically religious, he lavished land and treasure upon the priesthood, who repaid him by giving him in the *Mahavamsa* a superhumanly excellent character; he persecuted ruthlessly heretical Buddhist sects, which by the hierarchy was also accounted to him for righteousness; he endowed Brahmans, in a fine but hardly consistent, spirit of religious toleration; and, in imitation of Asoka, he imposed vegetarianism upon his overwrought people, and punished with great severity the taking of animal life, either in the water or on the land. The people must have been reduced in large numbers to a condition indistinguishable from slavery, and it is certain that this great monarch did much to ruin his country economically by his improvidence. Ceylon, or more properly Pihiti, had been conquered

and annexed by Indian princes on several occasions, but in 1408, in revenge for an insult offered to an envoy a Chinese army invaded the island and carried King Vijaya Bahu IV. into captivity. For 30 years Ceylon remained tributary to China.

Ceylon was first visited by the Portuguese when Francisco de Almeida landed there in 1505. He found an island divided into seven kingdoms, each ruled by its separate monarch, and each frequently at odds with one or more of its neighbours. In 1517 a fort was erected at Colombo by orders of the viceroy at Goa, with the permission of the king of Cotta; and from this time onward until the end of the 16th century the Portuguese were constantly at war with one or another of the native kingdoms. It is claimed that, when attacking and conquering Jaffna (Jaffnapatam) they obtained possession of the Tooth relic and, in spite of the enormous ransom offered for it, publicly burned it in the market-place at Goa in obedience to the archbishop, who would not suffer the viceroy to make money out of the sale of what he accounted an idol. By the Sinhalese priesthood, who still possess a Tooth relic the shrine of which is at Kandy, it is asserted that the object captured at Jaffna was a false tooth. The Portuguese won a firm foothold on the western littoral, and they succeeded in converting the bulk of the *karawa* or fisher-caste Sinhalese to Christianity. Conversions upon a considerable scale, but almost invariably among the lower caste sections of the population, were similarly effected in other parts of the island; and at the 1921 census Christians numbered 443,400, or nearly 10% of the total population of Ceylon, more than 95% being Roman Catholics. The proselytizing fervour and cynical rapacity of the Portuguese won for them hosts of enemies among the natives of all ranks, while their inherited traditional hatred for the *Moors*—by which term they described all Mohammedans—rendered them peculiarly odious to the latter, whose trade and shipping monopolies they had destroyed. The French, the Dutch and the British, when in turn they set the Bull of Alexander VI. at defiance and forced their way into the Indian ocean, were accordingly welcomed as deliverers by the people of the East generally; and the trading-centres which they had established in the beginning with such dauntless courage, and where they had exploited and persecuted the native populations so ruthlessly, fell before the Dutch and the British, fighting often in alliance with native potentates.

The Dutch admiral Spilberg landed on the east coast of Ceylon in 1602 and was welcomed by the king of Kandy who besought him to help in the ejection of the hated Portuguese. No action of importance was taken, however, until 1638-39, when a Dutch expedition attacked and destroyed the Portuguese forts on the east coast. In 1644 Negombo, which had once before been unsuccessfully attacked, fell to the Dutch; and in 1656 and 1658 Colombo and Jaffna were successively captured. The Dutch thus became masters of practically the whole of the maritime provinces of Ceylon, the kingdom of Kandy alone retaining its independence. The Dutch forthwith set about the task of the methodical and efficient administration of the country in a fashion never attempted by the Portuguese. They taxed the people heavily, but the land-registers which they instituted have endured to this day, as also has Roman-Dutch law, many of the provisions of which are now deeply ingrained in the traditions of the Low-Country Sinhalese peasantry and landholders. They also undertook public works upon a considerable scale; built excellent houses for their own accommodation, public offices, law courts and churches, many of which still survive; and the roads which they made opened up the interior and greatly stimulated the trade of the island. Tolerant to Buddhism, Hinduism and Mohammedanism, they persecuted the Catholics persistently, but the religion which had been acquired by thousands of Sinhalese and by the Ceylon-born Tamils of Jaffna and Mannar was too deeply rooted in the peoples' hearts for its extirpation to be possible. Throughout the Dutch period Kandy maintained its independence.

The British, who had dispatched an embassy to the king of Kandy from Madras as early as 1763 without result, after various naval skirmishes in the neighbourhood of Trincomalee and Batticalao, sent a well equipped force against the Dutch in Ceylon in 1795, met with only a feeble resistance and in less than a year

had obtained possession of the island. The Dutch rule had lasted for about 140 years, a period equal to that of Portuguese domination; but while the latter left Ceylon more distracted and no more developed than they had found it on their arrival, the Dutch administration, if somewhat harsh, and unimaginative, worked genuine and permanent improvement in almost every branch of the social and economic life of the people. The Dutch practice, followed by them for so long in almost all their overseas possessions, of taking over oppressive local systems of taxation, which had only been endurable because evasion was so common, and thereafter applying them with ruthless efficiency, made their rule highly unpopular; and even to-day the Burgher population, who are the descendants of the former Dutch rulers and settlers, are far from being loved by the Sinhalese. These Ceylonese Dutchmen, though many of their families have dilutions of oriental blood in their veins have retained their national character, their sturdy self-esteem, their traditions and high ideals of probity and conduct in a very remarkable degree. Until quite recently they had a practical monopoly of the clerical work in most public departments, and held most positions of trust in public departments and commercial houses.

At first Ceylon was administered from Madras, but an attempt to apply the Madras revenue system and the employment of a host of Malabar collectors led to a rebellion, and in 1798 Ceylon became a Crown colony. The Treaty of Amiens (1802) formally ceded Ceylon to Great Britain; and the following year Kandy was invaded and occupied. The garrison was shortly afterward treacherously massacred after it had been induced to lay down its arms. It was not till 1815, however, that the Kandyan chiefs (with some of whom at an earlier period governor North had carried on discreditable intrigues against their king) invoked the aid of the British to rid themselves of this tyrant of Malabar stock whose cruelties had surpassed endurance. The Kandyan kingdom was thus voluntarily handed over to the British Crown which guaranteed its people civil and religious liberty and the maintenance of their ancient customs. An insurrection which broke out shortly after was easily suppressed, and the second treaty (1818) which followed it did not materially alter in any respect the status of the Kandyan chiefs and people *vis-à-vis* the Crown. The pacification and opening up of the mountain country by the construction of roads led immediately to a great incursion of Low Country Sinhalese, Mohammedan and Hindu traders, and European coffee-planters. These latter penetrated into the virgin forest and, aided in the task of clearing by the Sinhalese villagers, carved out estates for themselves. The indigenous inhabitants declined to work for a wage on the European estates, save as artisans, etc., and it was found necessary to import as voluntary immigrants large numbers of Tamil coolies from the arid districts of southern India. Attempts to introduce cinchona were only partially successful, but very soon tea began to be planted and by the end of the century it was covering a far larger area than coffee had ever done. Then came rubber-planting, an enterprise in which, for the first time, Sinhalese planters took an active part, their energies having in the past been confined to the cultivation of coffee, which ended in disaster, to some cocoa-planting and to coconut-planting, which was and still is the major Ceylonese native agricultural industry. Large fortunes were also made by Ceylonese in plumbago mining. The consequent acquisition of wealth by the natives of Ceylon, and especially by men of the *karawa* caste, brought about a social upheaval, and led to an agitation for political reform, the real object of which (though stimulus was imparted to it by the Morley-Minto reforms in British India) was to break the monopoly which the highest caste *goigama* aristocracy had till then enjoyed of representing Sinhalese interests in the legislative council. During the agitation that preceded the granting of these claims, ill-feeling based on caste prejudice and upon the angry passions which such prejudice aroused, and racial animosity began for the first time to become vocal in Ceylon. The first scheme of reform was worked out in 1909 by Col. Seely, then under-secretary of State for the Colonies, and accepted by governor McCallum, in spite of the protests of his executive councillors and the obvious inapplicability of Seely's

scheme as originally framed by him to local circumstances. The first election of a representative of the educated Ceylonese was fought purely on caste lines, a high caste Tamil being chosen with the aid of the high caste Sinhalese vote, caste prejudice thus proving to be a stronger passion than racial bias. A state of growing unrest was thus created, and this was increased by the outbreak of the World War. In 1915 a religious *fracas* at Gampola, between the Buddhists and Mohammedans, most of

A SINHALESE WOMAN AND GIRL IN FRONT OF A THATCHED MUD HUT

whom were traders and shopkeepers and the creditors of the Sinhalese peasants, spread like wildfire. The governor and the colonial secretary were both British civil servants without any colonial experience. Instead of dealing promptly and firmly with the disturbances, using their trained civilians and their police for the purpose, they abdicated in favour of the G.O.C., who had only been a month in the island; allowed martial law to be declared; and suffered him to adopt measures for the suppression of the riots which have left behind them a bitter legacy of grievance and hatred. Ceylon, in spite of this, emerged from the World War comparatively speaking unscathed; but the politicians, whose hands the mismanagement of the riots had greatly strengthened, had tasted of success, and during the governorship of Sir William Manning (1918-25) a series of legislative reforms were granted in rapid succession, the final instalment in 1924 definitely vesting all financial control in the hands of 36 unofficial members, three of whom only are Europeans and the majority of whom are elected, the officials upon the legislative council numbering only 12, and meetings being ordinarily presided over by an elected Ceylonese vice-president. In the meantime three unofficial Ceylonese (two Sinhalese and one Tamil) and one European had been added to the executive council. Responsibility for the good administration of the island continued, none the less, to be vested solely in the governor, who is unable to discharge it save by the good will of the unofficial majority in the legislative council or by the exercise of his power of veto, which can easily be countered by a refusal to vote supply—action which would necessitate the practical suspension of the constitution. An appreciation of the impracticability and of the dangers of this situation caused the present writer while serving as governor of Ceylon (Nov. 1925 to June 1927), after a year of study, to recommend the appointment of a commission to examine the situation and to report as to the measures that could be best taken to surmount the *impasse*.

The special peculiarity of the political situation in Ceylon is that this small island contains a very heterogeneous population; that the Low Country Sinhalese number about 2,000,000, the Kandyans 1,000,000, the Ceylon-born Tamils about 500,000, Indian-born Tamils, most of them coolies on tea and rubber estates, about 600,000, Ceylon-born Moors 250,000, Indian-born Moors 33,000, Burghers and Eurasians about 30,000, and Europeans slightly more than 8,000. The Low Country Sinhalese, who are more sophisticated than the Kandyans, more diligent and more wealthy, have long ago spread themselves throughout the Kandyan provinces, claim, as Buddhists, a share in the management of Kandyan Temporalities, and are at pains to explain that the Sinhalese, or even the "Ceylonese," nation is one and indivisible. The Kandyans, on the other hand, who mark the peaceful but very lucrative penetration of their country by Low Country Sinhalese with dislike, remember that these folk aided the Portuguese, the Dutch and the British in their several attacks on the Kandyan kingdom and, knowing themselves to be at once outnumbered and outmatched by them view any system of government that places the supreme power in the hands of a majority with acute apprehension. These feelings are in some degree shared

by the Ceylonese Tamils, though in their case it is they who invade the country occupied by Low Country Sinhalese and, by superior energy, diligence and frugality, are rapidly underselling them in clerical and similar employment. They have no desire, however, to see the island ruled by a Low Country Sinhalese majority. The Burghers are still more apprehensive; while the Europeans, who represent huge financial interests, alike in the world of commerce and in agricultural enterprise, are only 156 of the total population of the island. (H. Cl.)

CÉZANNE, PAUL (1839-1906), French painter, was born at Aix, the ancient capital town of Provence, on Jan. 19, 1839. His father was a banker. Paul was educated at the *lycée* of the town, where he formed an intimate friendship with Émile Zola, the novelist. The two boys were both inspired by a love of the classics, particularly of Virgil, through whom, perhaps, Cézanne realized the beauty of his native country. Both decided to consecrate themselves to art. Zola settled down early to a literary career in Paris, but Cézanne endeavoured to comply with his father's wish that he should carry on the family bank. But after two unsuccessful attempts the father allowed Paul to settle in Paris and attended the art school. He arrived there in 1863.

Cézanne became known as one of the most extreme of the young revolutionary painters, the bitterest in his denunciation of official art and of Ingres who, then in his old age, was regarded as the head of the reactionaries. In this way he became acquainted with the group of painters who encircled Manet, and who afterwards became known as the impressionists. But Cézanne's work in his early years shows no sign of this frequentation. At this period he was most influenced by Delacroix and by the Baroque painters whom Delacroix studied, by Rubens and Tintoretto. His ambition was to create grandiose compositions of a purely imaginative description, expressive of his own internal moods, using either violently dramatic themes—"Les Assassins," "L'Autopsie," "Lazare"—or lyrical motives—"Le Jugement de Paris," "Déjeuners sur l'herbe." He also painted a series of portraits in which dramatic and psychological effects were undertoned. In these the influence of Courbet is evident. They are painted with broad strokes, the palette-knife ploughing up and planting down an exceedingly thick and dense impasto. In all these early works the colour is reduced to a few simple notes in which black, white and earth reds and yellows predominate. The tension of Cézanne's imaginative life shows itself in the tumultuous vehemence of these early compositions. He trusts to his inner convictions with a blind and reckless courage which was unfortunately not supported by the gifts necessary to make such an imagery plausible, or to give verisimilitude to the contorted poses of his Tintorettesque nudes. His outlook on nature seems to have been confined for the most part to the search for motives of chiaroscuro suitable to the dramatic effects of his imaginative designs. He showed at this stage nothing of the curiosity about natural effects of colour which distinguished the impressionist group. He was, in fact, far more concerned with expressing the exaltation of his own feelings, inspired by literature or imaginative brooding, than with the phenomena of the visible world. A few still-lives of this period show, however, how much greater his native endowment was in this direction than in the one he was consciously pursuing; but even in these the dramatic evocations of the thing seen are what chiefly interested him.

During the years 1872-73 a great change came over Cézanne. He spent the summers of these years at Anvers-sur-Oise in the company of Camille Pissaro, who was one of the impressionists. Pissaro was some years older than Cézanne and had already discovered his personal style and perfected a methodical and precise technique adapted to it. Cézanne, who had hitherto trusted to the inspiration of his imaginative ideas for his daring, but rather fortuitous technique, here for the first time underwent a methodical course of training. He learned for the first time to look on nature with a curious and contemplative gaze, and he learned a precise and methodical technical process, by which to record the

results thus obtained. Above all, the whole world of "atmospheric" colour was thus revealed to him. Certain pictures painted by Cézanne in these years approximate very nearly to Pissaro's work, but they show Cézanne's greater power of organizing form, and the greater profundity of the conceptions which his contemplation of natural appearance provoked in his intensely passionate nature. For these years, then, Cézanne may be counted an impressionist.

But Cézanne's response to appearances gave him a notion of design more vigorously constructed, and evocative of far deeper feelings, than any that the impressionists envisaged. To them the weft of colour which nature revealed to their specialized visual sense was all that mattered; out of that each artist could choose unconsciously those harmonies which specially appealed to him. But Cézanne always believed in some underlying reality of a more permanent kind, more consonant with the deeper instincts of human nature. The impressionist vision was both too casual and too imperfectly organized for him. It missed part of the truth which the older masters had apprehended. Cézanne summed up his own attitude by saying that his ambition was to do Poussin over again after nature, *i.e.*, to incorporate into a clearly organized formal unity, like Poussin's, the vision of natural appearance as enriched by impressionist researches. From this point Cézanne's personal vision and his personal expression of it were established. Such changes as his style underwent in the succeeding decades were only gradual modifications of what he had established once for all. The essentials of that style were due, as we have seen, to the special use he made of the impressionist vision. They were based upon the most rigorous construction of the design by means of the interplay of clearly articulated planes. But the movement of these planes, their salience and recession, was interpreted quite as much by changes in local colour as by the definition of form by light and shade. A characteristic of Cézanne's completely realized manner is the extreme simplicity of the approach, the fact that objects are presented in full frontal aspect. In nearly all his portraits the sitter is placed nearly in the centre of the canvas, the head and body being seen nearly in full face. In the landscapes a similar treatment is found; objects are extended in planes parallel to the picture plane, and frequently the main mass will be centrally placed. Such extreme symmetrical simplicity of approach takes us back to the practice of the Italian Primitives. It is violently opposed to the principles of Baroque composition as followed by most of Cézanne's predecessors and by himself in his early period.

Such an exaggeratedly simple disposition would probably strike us as crude and uninteresting if it were not that within the volumes which he places before us in this elementary fashion, his analysis of changes of surface and plastic movement is pushed to an extraordinary degree, and this is accompanied by innumerable slight modulations of colour, so that the whole surface takes on something of the infinity of natural appearance. This practice he developed with ever-increasing power. In the '70s and early '80s, the almost laborious scrutiny of infinitesimal colour changes led him to load the canvas with repeated layers of colour, though without ever losing purity and intensity. Later on he was able to get the same multiplicity of surface with thinner layers of colour. Together with this he tended also to simplify the colour changes, adopting even a regular principle of colour sequences to express movements away from the highest relief of any given volume. All this was strictly in keeping with his philosophical conception of the aim of painting. In everything he did he sought a synthesis in which the most rigorously logical plastic structure should be combined with the utmost liveliness of surface; that is to say, he sought, without losing the infinitude of natural appearance, to give to it an intelligibility and a logical coherence which it lacks. This, no doubt, is more or less the problem of all painting; what distinguishes Cézanne is his endeavour to attain this synthesis when each of the opposite terms is at its highest pitch.

To the last decade of the 19th century belong some of his most celebrated works: the portrait of Geffroy, which is perhaps unequalled in modern art for the completeness of its realization, the complexity and assurance of its harmonies; several versions of a composition of men seated at a café table and playing cards, in

which the primitive simplicity of the arrangement gives an elemental grandeur to the forms; and a series of landscapes in which the pyramidal mass of Mt. Ste. Victoire dominates the design. Even to the end of his life, Cézanne always cherished the hope of creating imaginative and "poetical" designs of nude figures in landscape, after the manner of some of Giorgione's and Titian's pictures. But in this he was hampered by his extreme reluctance to draw from the nude model, and most of these grandiose attempts remain failures.

At the very end of his life there seems to have been a kind of recrudescence in Cézanne of the romantic tendencies of his youth. His paintings become richer, more intense and vivid in colour, more agitated in rhythm, more vehement in accent; they also depart more and more from the careful analysis of natural appearance of the middle period, as though his long apprenticeship to nature had ceased and he felt free to follow unhesitatingly his instinctive feeling. The middle and end of Cézanne's life was passed in great seclusion at Aix, with occasional visits to Paris. In the '80s and '90s his very name had become almost unknown in the larger art circles of Paris, though he never lacked a few enthusiastic admirers. Gradually his fame began to circulate among the more intelligent artists, and in 1904 a retrospective exhibition of his works in the Autumn Salon revealed to the public the existence of this almost unknown genius. It was the only foretaste of his posthumous fame which he experienced. He died two years later, on Oct. 23, 1906.

C.G.S. SYSTEM, a system of units which takes as a basis the centimetre, the gram and the second. (See **UNITS, PHYSICAL** and **ABSOLUTE UNITS**.)

CHABAZITE, a mineral species belonging to the group of zeolites. It occurs as white to flesh-red crystals which vary from transparent to translucent and have a vitreous lustre. The crystals are rhombohedral, and the predominating form is often a rhombohedron with interfacial angles of $85^{\circ} 14'$; they therefore closely resemble cubes in appearance, and the mineral was in fact early (in 1772) described as a cubic zeolite. A characteristic feature is the twinning, the crystals being in many cases interpenetration twins with the corners of small crystals in twinned position projecting from the faces of the main crystal. A flat lenticular form of crystal is also common, this variety being known as phacolite (from *φακός*, a lentil). The hardness is $4\frac{1}{2}$, and the specific gravity 2.08–2.16.

TWINNED CRYSTAL OF CHABAZITE
Interpenetrating rhombohedra (nearly cubic in form) are especially characteristic of this mineral

Chemically, chabazite is a complex hydrated calcium and sodium silicate. The composition is, however, variable, and is best expressed as an isomorphous mixture of the molecules $(\text{Ca}, \text{Na}_2)\text{Al}_2\text{Si}_4\text{O}_{12} + 4\text{H}_2\text{O}$ and $(\text{Ca}, \text{Na}_2)\text{Al}_2(\text{Si}_3\text{O}_8)_2 + 8\text{H}_2\text{O}$, which are analogous to the feldspars. Most analyses correspond with a formula midway between these extremes, namely $(\text{Ca}, \text{Na}_2)\text{Al}_2(\text{SiO}_3)_4 + 6\text{H}_2\text{O}$. Chabazite occurs with other zeolites in the amygdaloidal cavities of basaltic rocks; occasionally it has been found in gneisses and schists.

Gmelinite is another species of zeolite which may be mentioned here, since it is closely related to chabazite. It forms large flesh-red crystals usually of hexagonal habit, and was early known as soda-chabazite, it having the composition of chabazite, but with sodium predominating over calcium $(\text{Na}_2\text{Ca})\text{Al}_2(\text{SiO}_3)_4 + 6\text{H}_2\text{O}$. (L. J. S.)

CHABLIS, a town of north-central France, in the department of Yonne, on the left bank of the Serein, 14 m. E. of Auxerre by road. Pop. (1926) 1,862. Its church of St. Martin belongs to the end of the 12th century. The town gives its name to a well-known white wine (see **BURGUNDY**).

CHABOT, PHILIPPE DE, SEIGNEUR DE BRION, COUNT OF CHARNY AND BUZANÇAIS (1492?–1543), admiral of France. The

Chabot family was one of the oldest and most powerful in Poitou. Philippe was a cadet of the Jarnac branch. He was a companion of Francis I. as a child, and on that king's accession was loaded with honours and estates. After the battle of Pavia he was made admiral of France and governor of Burgundy (1526), and shared with Anne de Montmorency the direction of affairs. He was at the height of his power in 1535, and commanded the army for the invasion of the states of the duke of Savoy; but in the campaigns of 1536 and 1537 he was eclipsed by Montmorency, and from that moment his influence began to wane. He was accused by his enemies of speculation, and condemned on Feb. 10, 1541, to a fine of 1,500,000 livres, to banishment, and to the confiscation of his estates. Through the good offices of Madam d'Étampes, however, he obtained the king's pardon (March 1541) and was reinstated, while Montmorency in his turn was disgraced. He died soon afterwards on June 1, 1543.

See the ms. correspondence of Chabot in the Bibliothèque Nationale, Paris and contemporary memoirs.

CHABOT, FRANÇOIS (1757–1794), French revolutionary, born at St. Geniez, near Aveyron, had been a Franciscan friar before the Revolution, and after the civil constitution of the clergy continued to act as "constitutional" priest. Then he was elected to the Legislative Assembly, sitting at the extreme left, and forming with C. Bazire and Merlin de Thionville the "Cordelier trio." Re-elected to the Convention he voted for the death of Louis XVI., and opposed the proposal to prosecute the authors of the massacre of September. Compromised in the falsification of a decree suppressing the India Company and in a plot to bribe certain members of the Convention, especially Fabre d'Églantine and C. Bazire, he was made to appear before the Revolutionary Tribunal, and was condemned and executed on April 5, 1794.

See *François Chabot . . . à ses concitoyens, . . . pluviose, an II. Mémoire apologétique, . . .* etc. ed. A. Mathiez (1914); J. M. J. A. de Bonald, *François Chabot, membre de la Convention* (1908).

CHABRIAS (4th century B.C.), Athenian general. In 388 B.C. he defeated the Spartans at Aegina and commanded the fleet sent to assist Evagoras, king of Cyprus, against the Persians. In 378, when Athens joined Thebes against Sparta, he defeated Agesilaus near Thebes. On this occasion he invented a manoeuvre, which consisted in receiving a charge on the left knee, with shields resting on the ground and spears pointed against the enemy. In 376 he defeated the Spartan fleet off Naxos, but, when he might have destroyed the enemy, remembering Arginusae (q.v.), he delayed to pick up his dead. Later, when the Athenians joined the Spartans, he repulsed Epaminondas before Corinth. In 366, together with Callistratus, he was accused of treachery in advising the surrender of Oropus to the Thebans. He was acquitted, and soon after he accepted a command under Tachos, king of Egypt, who had revolted against Persia. On the outbreak of the Social War (357) he joined Chares in the command of the Athenian fleet. He lost his life in an attack on the island of Chios, probably in the same year.

See Cornelius Nepos, *Chabrias*; Xenophon, *Hellenica*, v. 1–4; Diod. Sic. xv. 29–34; *Cambridge Ancient History*, vol. vi. (1927) chapters iii, vi. and viii. (with useful bibliography). See also **DELIAN LEAGUE**.

CHABRIER, ALEXIS EMMANUEL (1841–1894), French composer, was born at Ambert, Puy de Dôme, on Jan. 18, 1841, and first attracted general attention in 1883 by his brilliant orchestral rhapsody entitled *España*, the themes of which he had jotted down when travelling in Spain. His opera *Gwendoline*, produced at Brussels on April 10, 1886, was successful too and still more so its successor, of a lighter type, *Le Roi malgré lui*, which was brought out in Paris at the Opéra Comique.

CHACMA, the Cape baboon, *Papio porcarinus*, inhabiting the mountains of South Africa as far north as the Zambezi. The size of an English mastiff, this powerful baboon is blackish-grey in colour with a tinge of green due to the yellow rings on the hairs. Unlike most of its tribe, it is a good climber. It is destructive to crops.

CHACO, a territory of northern Argentina, part of a large district known as the Gran Chaco, bounded north by the terri-

tory of Formosa, east by Paraguay and Corrientes, south by Santa Fé, and west by Santiago del Estero and Salta. The Bermejo river forms its northern boundary, and the Paraguay and Paraná rivers its eastern. Pop. (1914) 46,274; (1926 estimate) 58,160; area, 52,741 sq. miles. The northern part consists of a vast plain filled with numberless lagoons; the southern part is slightly higher and is covered with dense forests, occasionally broken by open grassy spaces. Its forests contain many species of trees of great economic value; among them is the *quebracho*, which is exported for the tannin which it contains. The capital, Resistencia, with a population of 21,322 is situated near the Paraná river opposite the city of Corrientes. There is railway communication between Santa Fé and Resistencia.

CHACO CANYON, a tract of about 20,000 ac. in north-western New Mexico, U.S.A., set apart in 1907 as a national monument. It contains the most remarkable architectural remains of prehistoric North America and has yielded a rich collection of objects illustrative of a vanished civilization. The buildings, which sometimes attained a height of at least four storeys, show a variety of methods in stone construction. Several are of enormous size, Pueblo Bonito, the largest, measuring 667 ft. by 315 ft.; a wall still standing rises to 48 feet. This building, like most of the others, constituted a veritable village and contained 800 rooms and 32 *kivas*, or large ceremonial halls. Chetro-Kettle and Peñasco Blanco are similar structures, while other ruins show that the private house also was in use.

CHACONNE, a slow dance, introduced into Spain by the Moors, now obsolete. It resembled the Passacaglia (*q.v.*). The word is used also of the music composed for this dance—a slow, stately movement in $\frac{3}{4}$ time. Such a movement was often introduced into a sonata, and formed the conventional finale to an opera or ballet until the time of Gluck. The most famous of all chaconnes is that of Bach for violin unaccompanied—a colossal example which is generally played as an independent piece, though it is actually a movement in one of his violin sonatas (No. 4).

CHAD (CEADDA), **SAINT** (d. 672), brother of Cedd, whom he succeeded as abbot at Lastingham, was consecrated bishop of the Northumbrians by Wine, the West Saxon bishop, at the request of Oswy in 664. On the return of Wilfrid from France, where he had been sent to be consecrated to the same see, a dispute arose, which was settled by Theodore in favour of Wilfrid. Chad thereupon retired to Lastingham, whence with the permission of Oswy he was summoned by Wulfhere of Mercia to succeed his bishop Jaruman (d. 667). Chad built a monastery at Barrow in Lincolnshire and fixed his see at Lichfield.

See Bede's *Hist. Eccl.*; Eddius, *Vita Wilfridi*, xiv., xv., ed. J. Raine, Rolls series (1879).

CHAD, a lake of northern Central Africa lying between 12° 50' and 14° 10' N. and 13° and 15° E. It lies about 850 ft. above the sea in the borderland between the Sudan and the Sahara. The lake has greatly shrunk since it was first seen by Europeans; this is attributed to the progressive desiccation of the region. Thus a town which in 1850 was on the southern margin of the lake was in 1905 over 20 m. from it. But as the west shore is perfectly flat, a slight rise in the water causes the inundation of a considerable area, a fact to be remembered in considering the estimates made as to the size of the lake. In any case the Chad is but the remnant of what in recent geological times was a very much larger sheet of water spreading south, north east and east of its present limits. A considerable area lying to the north-east is below the level of the lake. Around the north-west and north shores is a continuous chain of gently sloping sand-hills covered with bush. In the east, the country of Kanem, the desiccation has been most marked. Along this coast is a continuous chain of islands running from north-west to south-east. They are generally low, being composed of sand and clay, and lie from 5 to 20 m. from the shore, which throughout its eastern side nowhere faces open water. Two principal groups of islands are distinguished, the Kuri archipelago in the south, and the Buduma in the north. The inhabitants of Buduma were noted pirates until reduced to order by the French. The coastline is, in general, undefined and marshy, and broken into numerous bays and peninsulas. It is also,

especially on the east, lined by lagoons which communicate with the lake by intricate channels, while across the middle of the lake are numerous mud-banks, marshes, islands and dense growths of aqueous plants. Another stretch of marsh usually cuts off the northernmost part of the lake from the central sections. The open water varies in depth from 3 ft. in the north-west to over 20 in the south. Fed by the Shari and other rivers, the lake has no outlet. The flood water brought down by the Shari in December and January causes the lake to rise to a maximum of 24 ft., the water spreading over low-lying ground, left dry again in May or June. But after several seasons of heavy rainfall the waters have remained for years beyond their low-water level. Nevertheless the loss by evaporation (estimated in the dry season to be roin. a month) and percolation is believed to exceed the amount of water received.

The southern basin of Chad is described under the Shari, which empties its waters into the lake about the middle of the southern shore, forming a delta of considerable extent. Beyond the south-east corner of the lake is a channel or depression known as the Soro or Bahr-el-Ghazal (not to be confounded with the Bahr-el-Ghazal affluent of the Nile). This channel goes north-north-east and some 250 m. from the lake reaches its lowest point, 500 ft. below Chad, in what is known as the Kiri lake (now dry). The remarkable levels led to the supposition of a connection between the basins of the Chad and the Nile. The French explorer, Jean Tilho, in his 1912-17 expedition showed that this was not the case and that the Chad is a closed basin. The Soro depression continues north-east some distance beyond Kiri. Then in the valleys between the Tibesti and Ennedi mountains the ground gradually rises and forms the watershed between Nile and Chad. In this direction, however, Chad at one time extended to the foothills of Tibesti and Borku. Besides the Shari, the Yedseram and Ulge enter the Chad on the south. The only other important affluent of the Chad is the Waube or Yo (otherwise the Komadugu Yobe), which rises near Kano, and flowing eastward enters the lake on its western side 40 m. N. of Kuka.

Lake Chad is supposed to have been known by report to Ptolemy, and is identified by some writers with the Kura lake of the middle ages. It was first seen by white men in 1823 when it was reached by way of Tripoli by Walter Oudney, Hugh Clapperton and Dixon Denham. By them the lake was named Waterloo. In 1850 James Richardson, accompanied by Heinrich Barth and Adolf Overweg, reached the lake, also via Tripoli, and Overweg was the first European to navigate its waters (1851). The lake was visited by Eduard Vogel (1855) and by Gustav Nachtigal (1870), the last-named investigating its hydrography in some detail. Owing to an exaggerated belief in its economic importance there was during the partition of Africa a "race" for Lake Chad; in 1890-93 its shores were divided by treaty between Great Britain, France and Germany. The first of these nations to make good its footing in the region was France. A small steamer, brought from the Congo by Emile Gentil, was in 1897 launched on the Shari, and, reaching the Chad, navigated the southern part of the lake. A British force under Col. T. L. N. Morland visited the western or Bornu side of the lake at the beginning of 1902, and in May of the same year the Germans reached Chad from the Cameroons. In 1902-03 French officers under Col. Destenave made detailed surveys of the south-eastern and eastern shores and the adjacent islands. In 1905 Boyd Alexander, a British officer, found that the lake then contained few stretches of open water. Later travellers found a good deal of open water; the extent of the water varying from year to year. One of the ancient trade routes across the Sahara from Tripoli to Kuka in Bornu strikes the lake at its north-west corner, but this has lost much of its former importance. As one of the results of the World War, that part of the lake region which was German passed (1919) under French mandate.

CHADDERTON, an urban district of Lancashire, England, on the river Irk, 1m. W. of Oldham. Pop. (1931), 27,455. It is a textile town, with some metal-working.

CHADERTON, LAURENCE (?1536-1640), Puritan divine, was born at Lees Hall, Oldham, Lancashire, was educated at Christ's college, Cambridge, and on the foundation of Emmanuel college in 1584, Sir Walter Mildmay, the founder, chose Chaderton for the first master. Chaderton was one of the four divines appointed to represent the Puritans at the Hampton Court conference; and he was also one of the translators of the Bible. He provided for 12 fellows and more than 40 scholars in Emmanuel college. Fearing that he might have a successor who held Arminian doctrines, he resigned the mastership in favour of John Preston. He died on Nov. 13, 1640, at the age of about 103, preserving his bodily and mental faculties to the end.

Chaderton published a sermon preached at St. Paul's Cross about 1580, and a treatise *On Justification* at Leyden. Other theological works remain in manuscript.

CHADRON, a city of north-western Nebraska, U.S.A., in the heart of the Pine Ridge country, at an altitude of 3,370ft.; the county seat of Dawes county. It is on Federal highway 20 and the Chicago and North Western railway. The population was 4,412 in 1920 (91% native white), and was 4,606 in 1930 by the Federal census. Pine-clad buttes give the city a delightful setting, and the Black hills of South Dakota are visible in the distance. It is the trade centre of a fine cattle and farming region, a division point on the railway, which maintains a roundhouse and machine shops here, and the seat of a State normal college (established 1911), which has an enrolment of over 1,200. There is a landing field for aeroplanes at the fair-grounds. The Pine Ridge Indian reservation (in South Dakota) is 35m. north, and 8m. south is a State park, which had 101,900 visitors in 1927. Chadron was settled in 1885 and incorporated in 1886.

CHADWICK, SIR EDWIN (1800-1890), English sanitary reformer, was born at Longsight, near Manchester, Jan. 24, 1800, and was educated for the bar. His essays in the *Westminster Review* (mainly on different methods of applying scientific knowledge to the business of government) introduced him to the notice of Jeremy Bentham, who engaged him as a literary assistant and left him a handsome legacy. In 1832 he was employed by the royal commission on the poor laws as an investigator, and in 1833 he was made a full member of that body. In conjunction with Nassau W. Senior he drafted the report of 1834 which procured the passing of the new poor law. His special contribution was the institution of the union as the area of administration. He favoured, however, a much more centralized system of administration than was adopted, and complained that the reform of 1834 was fatally marred by the rejection of his scheme for the management of poor law relief by salaried officers controlled from a central board, the boards of guardians acting merely as inspectors. In 1834 he was appointed secretary to the poor law commissioners. His relations with his official chiefs became much strained, and the disagreement led among other causes, to the dissolution of the poor law commission in 1846. Chadwick's chief contribution to political controversy was his constant advocacy of entrusting certain departments of local affairs to trained and selected experts, instead of to representatives elected on the principle of local self-government. While still officially connected with the poor law he had taken up the question of sanitation. His report on "The Sanitary Condition of the Labouring Population" (1842) is a valuable historical document. He was a commissioner of the Board of Health for improving the water supply, drainage and cleansing of great towns, from its establishment in 1848 to its abolition in 1854. He was made K.C.B. in 1889. He died at East Sheen, Surrey, on July 6, 1890.

See a volume on *The Evils of Disunity in Central and Local Administration . . . and the New Centralization for the People*, by Edwin Chadwick (1885); also B. W. Richardson, *The Health of Nations, a Review of the Works of Edwin Chadwick, with a Biographical Introduction* (1887). Many of his statistical papers are to be found in the *Journal* of the Royal Statistical Society.

CHAEREMON, Athenian dramatist of the first half of the 4th century B.C. Aristotle (*Rhetoric*, iii. 12) says his works were intended for reading, not for representation. According to Suidas, he wrote comedy as well as tragedy, and the title of his *Achilles, Slayer of Thersites* suggests that it was a satyric drama. His *Centaureus* is described by Aristotle (*Poet.* i. 12) as a rhapsody in all kinds of metres. The fragments of Chaeremon are correct in form and have an easy rhythm, but are marred by a florid style. It is not agreed whether he is the author of three epigrams in the Greek Anthology (Palatine vii. 469, 720, 721) which bear his name.

See H. Bartsch, *De Chaeremone Poëta tragico* (1843); fragments in A. Nauck, *Fragmenta Tragicorum Graecorum*.

CHAEREMON, of Alexandria (1st century A.D.) Stoic philosopher and grammarian. He was superintendent of part of the Alexandrian library and belonged to the higher ranks of the priesthood. In A.D. 49 he was summoned to Rome, with Alexander of Aegae, to become tutor to the youthful Nero. He was the author of a *History of Egypt*; of works on *Comets*, *Egyptian Astrology*, and *Hieroglyphics*; and of a treatise on *Expletive Conjunctions*. Chaeremon was the chief of the party which explained the Egyptian religious system as an allegory of the worship of nature. He can hardly be identical with the Chaeremon who accompanied (c. 26 B.C.; Strabo xvii. p. 806) Aelius Gallus, praefect of Egypt, on a journey into the interior.

Fragments in C. Müller, *Fragmenta Historicorum Graecorum*, iii. 495-499.

CHAERONEIA, an ancient town of Boeotia, about 7m. W. of Orchomenus. It may be the Homeric Arne. The site is partly occupied by the village of Kapraena; the ancient citadel was known as the Petrachus, and there is a theatre cut in the rock. Until the 4th century B.C. it was a dependency of Orchomenus. Its importance lay in its strategic position, the last serious obstacle to an invader of central Greece from the north. Two great battles were fought on this site in antiquity. In 338 B.C. Philip II. of Macedon defeated a confederation of Greek States (see below). In 86 B.C. the Roman general L. Cornelius Sulla defeated the army of Mithridates VI., king of Pontus, near Chaeroneia. Numerical superiority was neutralized by judicious choice of ground and the steadiness of the legionaries. Chaeroneia was the birthplace of Plutarch, who returned to his native town in old age, and was long held in honour. Pausanias (ix. 40) mentions the divine honours accorded at Chaeroneia to the sceptre of Agamemnon. (*Iliad*, ii. 101.) A colossal seated lion a little to the south-east of the site marks the grave of the Boeotians who fell fighting against Philip. This lion was found broken to pieces; the tradition that it was blown up by Odysseus Androutsos is incorrect (see Murray, *Handbook for Greece*, ed. 5. 1884, p. 409). It was re-erected in 1905.

CHAERONEIA, BATTLE OF, 338 B.C. This is of great historical importance as the victory by which Philip (q.v.) definitely established the Macedonian supremacy in Greece. In military history, however, too little is known of its details to give it marked significance. Philip's path into Boeotia was barred by the allied Athenians and Thebans both at the western route from Cytinium to Amphissa and the eastern pass of Parapotamii from Elateia to Chaeroneia. Philip first placed himself at Elateia; then, by a ruse of withdrawal, put the defenders of the western route still more off their guard and, moving from Cytinium by night, debouched into western Boeotia at Amphissa. He was thus on the rear of but at a distance from the defenders of the eastern pass, who thereupon fell back from Parapotamii. But instead of passing eastwards through hilly country which would have aided the resistance, he switched his army back to Elateia, moved unopposed through the pass of Parapotamii and descended upon the enemy's main army at Chaeroneia. Philip placed his 18-year old son, Alexander, in charge of the left wing, where his best troops

faced the redoubtable Thebans and after a bitter struggle gained the upper hand. Meanwhile he had retired his right wing elastically before the onset of the Athenians until he had drawn them on to low ground while he had retired on to a rising slope. Then, suddenly he launched a counterstroke and disrupted the Athenians. Both the victorious Macedonian wings now converged inwards upon the allied centre and crushed it between them. With the overthrow of the Theban army and the annihilation of the famous "Sacred Band" the sceptre of military as well as of political supremacy passed to the "new model" army of Macedonia that Philip had created. (See also MANTINEIA; GRANICUS, BATTLE OF THE; ALEXANDER.)

CHAETOGNATHA, a small group of transparent and for the most part pelagic organisms, whose position is very isolated. There are eight genera and 38 species; the best-known genus is *Sagittia* with 27 species. These animals exist in extraordinary quantities, so that under certain conditions the surface of the sea seems almost stiff with the incredible multitude of organisms which pervade it. Rough seas cause them to drop into deeper water. Deep-sea forms also occur, but the group is essentially pelagic. The Chaetognatha form part of the diet of pelagic fishes. They are very voracious readily devouring herring fry as big as themselves.

As a rule the body is 1 to 3 cm. in length, though some species are larger, by 4 or 5 mm. in breadth, and is shaped something like a torpedo with side flanges and a slightly swollen, rounded head. It can be divided into three regions—(i.) head, (ii.) trunk, and (iii.) tail, separated from one another by two transverse septa. The almost spherical head is covered by a hood which can be retracted; it bears upon its side a number of sickle-shaped, chitinous hooks and rows of low spines. A pair of eyes lie dorsally. The trunk contains a spacious body-cavity filled during the breeding season by the swollen ovaries, and the same is true of the tail, substituting testes for ovaries.

The skin consists of a transparent cuticle excreted by the underlying ectoderm; beneath this is a basement membrane; and then a layer of longitudinal muscle fibres which are limited inside by a layer of peritoneal cells. The muscles are striated and arranged in four quadrants. Along each side of the body stretches a horizontal fin and a similar flange surrounds the tail.

The mouth opens on to the ventral surface of the head. It leads into a straight alimentary canal whose walls consist of a layer of ciliated cells, ensheathed in a thin layer of peritoneal cells. There is no armature, and there are no glands, and the whole tract can be divided only into an oesophagus and an intestine. A median mesentery running dorso-ventrally supports the alimentary canal and is continued behind it into the tail, thus dividing the body cavity into two lateral halves.

There are no specialized circulatory, respiratory or excretory organs. The nervous system consists of a cerebral ganglion in the head, and a ventral ganglion in the trunk, with lateral commissures uniting these ganglia on each side. There is a minute but extensive nervous plexus all over the body.

Chaetognatha are hermaphrodite. The ovaries are attached to the side walls of the trunk region; between them and the body wall lie the two oviducts whose inner and anterior end is closed,

their outer ends opening one on each side of the anus, where the trunk joins the tail. This oviduct fits closely over a second duct, the receptaculum seminis, which the spermatozoa enter, passing through the walls and finally reaching the ripe ovum. Temporary oviducts are formed at each oviposition. A number of ova ripen simultaneously. The two testes lie in the tail and the spermatozoa pass out through short vasa deferentia with internal ciliated funnels.

With hardly an exception the transparent eggs are laid into the sea and float on its surface. The development is direct and there is no larval stage. As in some insects, the cells destined to form the reproductive organs are very early apparent.

The great bulk of the group is pelagic, as the transparent nature of all their tissues indicates. They move by flexing their bodies. The Chaetognatha appear to have no close relatives, and probably arose from the primitive *Procoelomate* stock in very ancient times. Recently Meek has attempted to show that they are related to the vertebrates. (See also PLANKTON.)

See G. T. Burfield, "Sagittia" (*L.M.B.C. Memoirs*, xxviii. 1927); Meek, *Proc. Zool. Soc.* (Lond. 1928).

CHAETOPODA, originally a zoological class, including all the Annelida (*q.v.*), except the Echiuroidea (*q.v.*). F. E. Beddard uses the term to cover the modern classes Archiannelida, Polychaeta, Oligochaeta, Hirudinea (leeches) and Myzostomida (*q.v.*). Parker and Haswell (*Textbook of Zoology*) use the term to include only the Polychaetes and Oligochaetes. The characteristic feature of Chaetopoda is the possession of bristles (*setae*). The term is now obsolete.

CHAFER, a word used in modern speech to distinguish the beetles of the family *Scarabaeidae*, and more especially those species which feed on leaves in the adult state. For the characters of the *Scarabaeidae*, see COLEOPTERA. This family includes a large number of beetles, some of which feed on dung and others on vegetable tissues. The cockchafers and their near allies belong to the subfamily *Melolonthinae*, and the rose-chafers to the *Cetoniinae*; in both the beetles eat leaves, and their grubs spend a long life underground devouring roots. In Britain the Melolonthines that are usually noted as injurious are the two species of cockchafer (*Melolontha vulgaris* and *M. hippocastani*), large heavy beetles with black pubescent prothorax, brown elytra and an elongated pointed tail-process; the summer-chaffer (*Rhizotrogus solstitialis*), a smaller pale brown chafer; and the still smaller garden-chaffer or "cockerbundy" (*Phyllopertha horticola*), which has a dark green prothorax and brown elytra. Of the Cetoniines, the beautiful metallic green rose-chaffer, *Cetonia aurata*, sometimes causes damage, especially in gardens. The larvae of the chafers are heavy, soft-skinned grubs, with hard brown heads provided with powerful mandibles, three pairs of well-developed legs, and a swollen abdomen. As they grow, they become strongly flexed towards the ventral surface, and lie curled up in their earthen cells, feeding on roots. The larval life lasts several years, and in hard frosts the grubs go deep down away from the surface. Pupation takes place in the autumn, and though the perfect insect emerges from the cuticle very soon afterwards, it remains in its underground cell until the ensuing summer. After pairing, the female crawls down into the soil to lay her eggs. The grubs of chafers, when turned up by the plough, are greedily devoured by poultry, pigs and various wild birds. When the beetles become numerous, they are usually shaken off the trees where they rest on to sheets or tarred boards. On the continent of Europe chafers are far more numerous than in Britain, and the rural governments in France give rewards for their destruction. The anatomy of *Melolontha* is described in a memoir by H. E. Strauss-Dürckheim (1828).

CHAFF, the husks left after threshing grain (A.S. *ceaf*, allied to O.H.Ger. *cheva*, a husk or pod); also hay and straw chopped fine as food for cattle; hence, the worthless part of anything. The colloquial phrase, to chaff, meaning to make fun of a person, is derived from this word, or from "to chafe," meaning to irritate.

CHAFFARINAS or **ZAFFARINES**, a group of islands belonging to Spain, off the north coast of Morocco, $2\frac{1}{2}$ m. to the north of Cape del Agna, Pop. *c.* 320. The islands, which were the

CHAETOGNATHA, "ARROW-WORM,"
A GROUP OF TRANSPARENT ORGANISMS WHICH EXIST IN GREAT QUANTITIES NEAR THE SURFACE OF THE OPEN SEA

Tresinsulae of the Romans and the *Zafrān* of the Arabs, were occupied by Spain in 1848. The Spanish Government undertook the construction of breakwaters to unite the central island, Isabella II., with the neighbouring islet of El Rey, in order to enclose a deep and already sheltered anchorage. The largest island, Del Congreso, is rocky and hilly.

CHAFF-CUTTER: see FARM MACHINERY.

CHAFFINCH, a bird (*Fringilla coelebs*), belonging to the family *Fringillidae* (see FINCH), distinguished, in the male sex, by the deep greyish blue of its crown feathers, the yellowish green of its rump, two conspicuous bars of white on the wing coverts, and the reddish brown passing into vinous red of the throat and breast. The female is drab, but shows the same white markings as the male; the young males resemble the females until after the first autumn moult. The chaffinch breeds early, and its song may be heard in February. It builds its nest on trees and bushes, preferring those overgrown with lichens. The nest is composed of moss and wool, lined with grass and feathers. It lays four or five eggs of a pale purplish buff; streaked and spotted with purplish red. In spring the chaffinch is destructive to early flowers, and to young radishes and turnips; in summer it feeds on insects and their larvae, while in autumn and winter its food consists of grain and other seeds. On the continent of Europe the chaffinch is a favourite song-bird. In winter chaffinches form small flocks, often composed solely of males.

CHAFING-DISH, a sort of portable grate heated with charcoal, and used for cooking or keeping food warm. In a light form, and heated over a spirit lamp, it is also used for cooking various dainty dishes at table.

CHAGOS, an archipelago in the Indian ocean, belonging to Great Britain and administered by Mauritius, set around the Chagos bank (circumference c. 270m.), in 4° 44' to 7° 39' S., and 70° 55' to 72° 52' E. Total land area, 76 square miles. The atolls on the south and east side of the bank have disappeared through subsidence; a few—Egmont, Danger, Eagle and Three Brothers—still remain, but most of the population (445 in 1921, a large proportion being negro labourers from Mauritius) is centred on Diego Garcia, which lies on the south-east side, and is nearly 13m. long by 6m. wide. The lagoon is enclosed by two coral barriers and is accessible to the largest vessels on the north side. The French occupied the islands in 1791 from Mauritius, and the oil industry (from which the group is sometimes called the Oil islands) came into the hands of French Creoles. In 1814 Mauritius and its dependencies were ceded to England. Large quantities of coconut oil are exported annually (over 134,000gals. in 1925 against 100,000gal. per ann. 20 years ago). Other exports are coconuts, copra, guano and salted fish.

CHAGRES, a village of the Republic of Panama, on the Atlantic coast of the Isthmus, at the mouth of the Chagres river, and about 8 m. W. of Colón. It has a harbour from 10 to 12 ft. deep, which is difficult to enter, however, on account of bars at its mouth. The port was discovered by Columbus in 1502, and was opened for traffic with Panama, on the Pacific coast, by way of the Chagres river, in the 16th century. With the decline of Porto Bello in the 18th century Chagres became the chief Atlantic port of the Isthmus, and was at the height of its importance during the great rush of gold-hunters across the Isthmus to California in 1849 and the years immediately following. With the completion of the Panama railway in 1855, however, travel was diverted to Colón, and Chagres soon became a village of miserable huts, with no evidence of its former importance. On a high rock at the mouth of the river stands the castle of Lorenzo, which was destroyed by Sir Henry Morgan when he captured the town in 1671, but was rebuilt soon afterwards by the Spaniards. Chagres was again captured in 1740 by British forces under Admiral Edward Vernon.

CHAIN-GANG, an American method of handling convicts, working principally on State road construction, stone quarrying and bridge building in the States of Virginia, North Carolina, Georgia, Florida and Alabama. The convicts are generally housed in temporary buildings of rough construction with inadequate sanitary arrangements, and are more or less isolated. In Virginia

and Alabama the buildings are of a portable type, similar in construction to an army barrack. In some instances in Georgia a steel wagon cage is used. These cages are about 18 ft. long and 10 ft. wide and sometimes house as many as 18 men, sleeping in triple-decked bunks. The housing conditions differ in the several States, Alabama having by far the best conditions. In all of the camps except Alabama some method of chaining the men who are not trusties is in use. The most common method is the use of the "bull-chain," 4 ft. long, weighing about 3 lb., which is attached to a heavy iron cuff riveted around the right ankle. In going to and from work and during the time the convicts are confined in their quarters, the end of the bull-chain is attached to a long master chain which keeps all of the convicts leashed together. Sometimes, especially in the case of men who have attempted to or who have escaped and been returned, step-chains are used in addition to the bull-chain. These are attached by the use of leg irons, to both ankles, and are from 15 in. to 22 in. in length. Harsh methods of punishment prevail, ranging from solitary confinement on diminished rations to whipping, and, in Georgia, to the use of antiquated stocks and sweat-boxes. While, due to the long outdoor season, the labour of chain-gangs affords a great saving in the cost of road construction and is valuable in the prevention of idleness on the part of prisoners, the chaining of the men cannot help but have a definite demoralizing effect. In addition to the State chain-gangs there are in many localities similar county chain-gangs. (W. B. Co.)

CHAIN MANUFACTURE is the fabrication of a series of links, usually of metal, which are joined together by one of several methods. A chain provides a flexible loop or a connection between objects. The metal of the link is sometimes twisted to form a knot, or welded to strengthen the connection. Many methods of manufacturing chain by hand and machinery are now in vogue. Although a small quantity of chain is used for holding prisoners in check, the bulk of it serves man in various phases of his daily life. On the sea it is used for huge ship anchor chains, deck lashing chains, steering gear chains, buoy chains, etc. Railways use safety chains, brake chains, conductor's valve chains, etc. For motor travel on wet and icy roadways, anti-skid chains are used. Likewise on the farm, in the mine, the forest, the shop or on any extensive engineering operation, usage is found for chain.

There are three general classifications of chain: welded, weldless and transmission, the latter being literally a weldless style. Various materials are used in the manufacture of chain. Precious metals and semi-precious stones are formed into chains for jewelry and ornaments. Industrial chains are made from iron, steel, brass, bronze, nickel, aluminium and other metals or alloys. The large majority of commercial chain is made from wrought iron or steel. Wrought iron has had preference among fire-welded chain makers for many years. Wrought iron is generally regarded as the most reliable material in the manufacture of chains for uses where a failure would endanger life or property. It has considerable ductility, weldability and rust resistance. However, many reliable chains are made from steel.

Workmanship.—Hand and machine-made chain links usually go through several processes before they are ready for assembling into chains. Exceptions are in the instances of links used in cast chain, knotted chains and chain made directly from the solid bar. These processes vary widely in the different types of chain. In hand-made chain, the first operation consists of cutting the bar into short sections to a predetermined length, governed by the size of the link to be made. This short section is flattened, usually called "scarfed," at each end and then bent into a U shape. The scarfed ends are then brought to a welding temperature, threaded through the last finished link, and the weld completed by hammering. To give the welded end a finished appearance, concave tools, called "dollies," are sometimes placed over the weld and by additional hammering on the dollies, the weld is smoothed and shaped. The heating material for the chain maker's furnace is either coke, oil or gas.

By the use of machines some of these operations in this method are eliminated and others made easier. Bars or rods of metal are wound by machine into oval coils and single convolutions of the

coils are cut on an angle of about 45° , thus furnishing single-scarfed links ready for placing in the furnace to be heated. When the scarfed ends are at a welding temperature, the link is removed from the fire, threaded into the last completed link and the weld completed. Completion of the weld is accomplished with the aid of a hand hammer which is used to close the scarfed ends of the link together with a few blows. From this point the weld is completed in a power hammer, equipped with dies which fit over the welded end of the link. These hammers are operated by foot power, direct drive or indirect drive from some remote source of power. Chains made by this method have a slight twist in them. This twist is caused by the coiling operation. When the chain is for uses where this twist would be objectionable the twist is removed in a power hammer having especially designed dies, which straighten each link immediately after it is welded.

Electric Welded Chain.—This is the latest development in welded chain manufacture. A large part of the world's tonnage of small welded chain is now made by this method. Sizes up to $\frac{3}{4}$ in. diameter are commercially made in large quantities. Any of the larger sizes can be electrically welded but manufacturing costs in 1928 were too high. Three types of electric welds are in general use at the present time—the butt weld, the half-butt weld and the flash weld. All of these are of the resistance type, in which the electric current, passing through the material and across the butted ends of the link, produces sufficient heat to raise the metal to the welding or fusing temperature. A later development in electric chain welding is called "percussion welding," but it is not being used commercially. In this latter method, an electrically charged condenser is discharged across the butted ends of a chain link.

Links for electric welding are prepared differently than for fire welding. In the electric method, coils of wire or rods are passed through a chain-forming machine, which automatically straightens the wire, cuts the required length, threads the wire into the last completed link and forms the link, making a continuous chain ready for the welding machine. This butted chain is passed through a chain-welding machine which welds the links. Some welding machines weld alternate links and others consecutive links. They are automatic with one operator attending many machines, or semi-automatic, requiring the services of an operator for each machine. In the electric-weld process the weld is usually made at the side of the link. In the fire-weld process the weld is usually at the end of the link, the exception being certain very large sizes which are sometimes made with the weld at the side. Some electric-welded chain is made with weld at the end of the link, but this is the exception, rather than the rule. In the upset-welding method the links are welded at a relatively low temperature and the butted ends pressed together by a relatively low pressure. This type of weld is characterized by the extruded metal at the weld, forming a bulge which is seldom trimmed off. The semi-upset welding method is similar to the full-upset, with the exception that when the weld is about to be completed a die is placed over one-half the diameter of the material at the butted portion. This die prevents the metal from being forced to the outer side of the link.

Flash welding is also of the resistance type. It is distinguished by a small amount of metal extruded at the butted ends when the pressure is applied to form the weld. Because of the pressure and closeness of the electrodes, this excess metal, sometimes called the "flash," takes the shape of a flattened ring, differing in this respect from the bulge of the upset-weld. The "flash" is trimmed off close to the diameter of the material, leaving a smooth weld which, when polished, defies detection.

Welded chain is used largely in the straight link variety; however, some use is also made of twisted links. This type has the links twisted so that each link will be in approximately the same plane and therefore lie flat. In the fire-weld method each link is twisted as completed, but in the electric process the completed chain is passed through a machine which automatically twists the links. Other chains which have the same general shape as the welded chains, yet are not welded, include cast chains, which are made by casting metal in properly shaped molds, and solid link chains, made by stamping a solid cuneiform bar into the shape of

stiff chain and twisting the individual links apart to make it flexible. The result is a solid, link chain having the appearance of a welded chain.

Anchor Chain.—For ship anchors is used a chain with links having a bar, called a stud, across the inside width of each link. This is called "stud-link" chain and in marine circles is referred to as a chain cable. Both the forming and welding operations are similar to the open link fire-welded chain. After the open link is completed, the stud, concave at each end, is inserted in the link and the sides pressed together. A relatively small amount of stud-link chain is made by a steam hammer process in which the link bars are upset; i.e., balled on the end and scarfed by machines. The scarfed ends are heated and the weld completed on a steam hammer. In cast steel chain the stud is cast at the same time as the balance of the link and becomes a solid part of the link. Studs used in wrought iron chain are either castings or drop forgings. There are several reasons for putting the stud in this type of chain. It prevents the chain from fouling, adds weight to the link and prevents the link from deforming at a relatively low load. It does not increase the tensile strength of the chain, as is generally supposed.

Weldless Chain.—The term "weldless chain" covers a wide range of styles and broadly includes knotted chains, stamped link chains, transmission chains, bead chains, malleable chains, etc. Knotted chains bear a close relationship to the welded chain because they were developed, as a low-priced product, to replace small sizes of welded chain. They are practically all made upon automatic machines which fabricate the chain by straightening the wire, cutting, threading and tying, a single machine making the complete chain from the coil of wire to the finished product. There are about a dozen different styles of these chains in general use. Other forms of weldless wire chains contain no knot and consist simply of twisted wires hooked together—such as jack chain and ladder chain. Stamped link chain such as sash chain and transmission chain require at least two operations in their manufacture. The first operation blanks the links and the second, either automatic or by hand, assembles them. Bead or ball chain, commonly used in electric light fixtures, consists of a series of hollow balls joined by solid bars, the latter having a ball or cross-pipe formed at its ends. This chain is also made entirely by automatic machines. Jewellery chain in an almost endless variety is made from precious metals and used chiefly for ornament. Such chains are often made with oddly shaped links and with combinations of differently shaped links. Those made automatically bear somewhat of a uniform construction throughout their length, while other designs formed and ornamented by hand, vary in details with almost every link.

Finishes used on chain include practically every known finish for which there is a demand. Many chains are sold in their natural finish, as they come from the forge or machine. Some are polished highly by tumbling in sawdust, sand or leather scraps. Protective coatings, such as asphaltum, zinc, tin and lacquer are frequently used. Various colours of paints, powders and japans are used on chains for ornamental purposes, such as chandelier chain. Still others are plated with copper, brass, chromium, cadmium, nickel and other metals or alloys. At present, Cradley Heath, in the Black Country of England, is the centre of heavy-chain manufacture, while York, Pennsylvania, U.S.A., is the centre of small-chain manufacture. (H. M. B.)

Testing.—After welded chain is made it should be given a "proof test" and each link examined for exterior defects. The purpose of this test is to determine if there are any hidden defects which would render the chain unsafe for its rated working load. Any load which is higher than the rated working load yet lower than the elastic limit of the chain link is suitable for this proof test. Railroads, testing bureaus, large users of chain, etc., have specifications giving definite loads to which the various sizes and grades of chain must be tested by the manufacturer. For many years it has been customary to proof test welded chain to a load equal to one-half of the average ultimate tensile strength. Many chain manufacturers continue to follow this practice. Some chain authorities feel that such a load is injurious to the chain links

especially when applied to iron chains. They recommend as a substitute a load about 25% higher than the working load. The statutory proof load required by the British board of trade applying to close-link chain for use on British ships is: proof load to be $12d^2$ tons, where d is the diameter in inches of the iron in the link. For stud-link chain the proof load is 50% higher than for the open-link chain although the tensile strength is practically the same. Knotted types of chain are not proof tested. There are no standard dimensions for chain links. Link dimensions vary with different manufacturers. Well proportioned links can be designed by making the outside dimensions $4\frac{1}{2}$ by $3\frac{1}{4}$ times the diameter of the material, for close-link chain and 6 by 3.6 times for stud-link chains. These dimensions can be varied.

Destruction Tests.—To determine what ultimate tensile strength may be expected from a finished chain a section several feet long should be tested to destruction. Toughness and ductility of the iron from which the links are made should be given greater consideration than merely high tensile strength when selecting a chain for use where a reliable chain is required. Chain with a high tensile strength is often brittle and will break without warning whereas a chain made from a ductile material will stretch considerably before breaking. Toughness and ductility can best be determined by observing the structure of the break and by the relative amount of reduction in area and the elongation at the point of fracture. These features should be determined in a straight bar of the material from which the links are to be made. Total stretch of a chain before breaking is of little value in determining the toughness and ductility of the material because the elongation of the chain is governed primarily by the shape of the links and not by the composition of the material.

Permissible Loading.—Maximum working loads for chains should be based upon the proof test and should never be higher than the rated working loads suggested by the manufacturer of the chain, individual specifications or testing bureau for the size and grade of chain being considered. Working loads are always given to be used when the chain is lifting in a vertical position. It should be noted (*see table*) that the working load of a chain

*Working Loads of Sling Chains When Used at Angles
Wrought Iron Open Link Chain*

| Size chain, inches | Maximum working load for each branch of sling when used for vertical lift. In lbs. | Maximum working load for each branch of sling when used at angle of 30° from vertical. In lbs. | Maximum working load for each branch of sling when used at angle of 60° from vertical. In lbs. |

when lifting at any angle to the vertical line is always lower than for the vertical lift. When lifting at an angle of 60° to the direction of pull, as with a double sling chain, the working load is only one-half of the working load for the same chain when used

for vertical lifting.

(H. M. B.; W. L. GN.)

CHAIN-SHOT, two large bullets or half-bullets fastened together by a chain; formerly used in naval engagements to cut rigging, etc., and sometimes in land battles as a short-range projectile.

CHAIN STORES. A chain store (known in Great Britain as "multiple shop") system consists of a number of unit retail stores operating under a common ownership and management, and following common policies and utilizing common methods of operation which are determined by the central management. The purpose of a chain store organization is to combine to a large degree the advantages of large and small scale retailing. Chain store organization consolidates the ownership and management of many retail units within the same line of merchandise, but with decentralized location. On the one hand, a chain store system enjoys the economies of departmentalization, large purchases, standardization of methods and skilful management. On the other hand, it reaches to the very door of the consumer and provides convenient availability in neighbourhood locations.

The first of the existing chain store systems appears to have been the Great Atlantic and Pacific Tea company which was founded in 1858. The Jones Brothers Tea company was established in 1872; Woolworth's 5 and 10¢ stores in 1879; the James Butler company's grocery chain in 1882; the McCrory grocery chain in 1882; and the S. S. Kresge company in 1885. The United Cigar Stores company came into existence in 1901; the J. C. Penny chain of general stores in 1902; and the United Drug company in 1902. The grocery chain systems, including the tea and coffee retail distributors, were the first in the field. During the period from 1880-1900 the 5 and 10¢ stores, together with their prototypes, the "99¢ stores," the "racket stores," and the "novelty stores," came into being. Since 1900 the chain store idea in the United States has spread into 55 different fields, including automobile supplies, bakeries, barber shops, clothing, confectionery, drugs, shoes, tobacco products, etc.

Since 1923 two significant developments in the growth of chain store systems have been apparent. Until that year, chain stores developed most rapidly in the larger cities. Since that time there has been a very general movement toward the establishment of chain store units in smaller towns. This has been particularly true in the grocery, 5 and 10¢ and drug fields, in which chain store retailing has expanded most rapidly since 1923. In addition to this development it now appears that the mail order houses will soon become important chain store factors. Sears, Roebuck and company has begun to establish a chain of department stores, most of which, at the beginning of 1928, were located in large cities, but Montgomery Ward and company has announced a plan of setting up 1,500 retail stores mainly in medium and small-sized towns. In 1928 there were in operation in the United States more than 3,700 chain store systems with more than 100,000 unit members. At the close of 1927, the volume of business done by chain store systems made up 12% of the total retail trade of the United States.

The chain store attempts to go to the people instead of asking the people to come to it as do the department store and the down-town specialty store. It places a premium upon convenient locations, but it chooses its location carefully, considering the character and trend of the population in a particular district, traffic habits, etc. It attempts to cover a territory in which its individual unit stores are close enough to permit of supervision and supply from centrally located warehouses. The chain store also attempts to give the exterior and interior of its individual unit stores an attractive appeal to the eye through easy entrances, appropriate fixtures and display, adequate lighting, etc. Generally, it tries to standardize the physical arrangement, equipment and position of stock in its unit stores. The merchandising policies of the chain store begin with quantity purchasing to a large extent direct from the manufacturer. Most chain stores specialize not only in buying one general line of merchandise, but in buying only those items, styles and sizes out of that line which sell most readily. They discover what most people want and concentrate upon that. They attempt to buy staple goods which

are frequently purchased and which permit a rapid rate turnover at small profits per individual sale. They try to handle merchandise which is not especially bulky and the average sale of which is not large so that deliveries are made unnecessary. Chain store merchandising, so far as selling is concerned, places great emphasis upon the proper arrangement and display of merchandise, and prominent and plain price-tagging. Chain store advertising is largely newspaper advertising which features price. Of late the following tendencies in chain store advertising are somewhat noticeable, (1) a greater use of institutional copy, (2) the use of national magazine advertising, featuring both nationally-advertised and private or controlled brands.

The Position of the Chain Store
(Classified by eleven cities)

(G. R. C.)

Great Britain.—The multiple shop system came into existence at the end of the 19th century and has since had remarkably wide developments. Among the retail trades which have been conspicuously organized in this way are chemists and druggists, oil and colour men, drapers, boot and shoe shops, clothiers, tea shops and cafés, milk retailers, grocers and furniture dealers. The first multiple shops in England may be said, however, to have been the "tied houses" of many brewing firms, who found it profitable to become the owners or lessees of large numbers of beer houses and other licensed premises to secure markets for a definite and considerable proportion of their output, and who worked these multiple shops through managers under their direct control.

The economy of the multiple shop system is readily understood. A company owning 20, 50 or 100 branch shops is in a very favourable position in buying, because of its great capacity to buy. Giving orders in large quantities to manufacturers, it can secure the most favourable terms and demand not only low prices but good design and quality; it is obviously in a much better position in this respect than the independent shop-keeper, whose order can be only a comparatively small one. Such a company is also able, through large buying, to have goods specially made for it. By virtue of its wide-spread operations it can make a name and goodwill for itself which may become national in extent, so that a purchaser visiting a strange town will feel confidence in going to its establishment because he knows that the multiple shop company maintains a high level of service.

In some industries, there are cases in which manufacturers themselves enter the distributive business and establish a chain of multiple shops to form a market for their own output, thus securing for themselves both the wholesale and retail margins of profit.

The growth of the multiple shop system means the elimination or suppression of a certain proportion of small independent trading units. A shop-keeper stands for a small independency; he is his own master and a definite social unit in the life of his town. The substitution for the shop-keeper of a company-appointed manager amounts to a change of some importance from a social

point of view. The manager may or may not be a local man; he may or may not be identified with the life of the town in which he draws his salary as a shop manager. Moreover, the profit made by the shop is drawn off from the society in which it is made and distributed at some great centre by a company to its shareholders. The aggregate effect of these social and economic changes it is impossible to determine with accuracy, but it must be considerable.

CHAIR, a movable seat, usually with four legs and for a single person, the most varied and familiar article of domestic furniture. (In Mid. Eng. *chaere*, through O.Fr. *châere* or *chaïere*, from Lat. *cathedra*, later *caledra*, Gr. *καθέδρα* seat, cf. "cathedral"; the modern Fr. form *chaise*, a chair, has been adopted in English with a particular meaning as a form of carriage; *chaise* in French is still used of a professorial or ecclesiastical "chair," or *cathedra*.) The chair is of extreme antiquity, although for many centuries and indeed for thousands of years it was an appanage of state and dignity rather than an article of ordinary use. "The chair" is still extensively used as an emblem of authority. It was not until the 16th century that it became common anywhere. The chest, the bench and the stool were until then the ordinary seats of everyday life, and the number of chairs which have survived from an earlier date is exceedingly limited; most of such examples are of ecclesiastical or seigniorial origin.

Ancient Chairs.—In ancient Egypt they were of great richness and splendour. Fashioned of ebony and ivory, or of carved and gilded wood, they were covered with costly stuffs and supported upon representations of the legs of beasts of the chase or the figures of captives. The earliest monuments of Nineveh represent a chair without a back but with carved legs ending in lions' claws or bulls' hoofs; others are supported by figures in the nature of caryatides or by animals. The earliest known form of Greek chair, going back to five or six centuries before Christ, had a back but stood straight up, front and back. On the frieze of the Parthenon Zeus occupies a square seat with a bar-back and thick turned legs; it is ornamented with winged sphinxes and the feet of beasts. The characteristic Roman chairs were of marble, also adorned with sphinxes; the curule chair was originally very similar in form to the modern folding chair, but eventually received a good deal of ornament.

The most famous of the very few chairs which have come down from a remote antiquity is the reputed chair of St. Peter in St.

"DAGOBERT CHAIR," OF CAST BRONZE AND PROBABLY MORE THAN 1,000 YEARS OLD

Peter's at Rome. The wooden portions are much decayed, but it would appear to be Byzantine work of the 6th century, and to be really an ancient *sedia gestatoria*. It has ivory carvings representing the labours of Hercules. A few pieces of an earlier oaken chair have been let in; the existing one, Gregorovius says, is of acacia wood. The legend that this was the curule chair of the senator Pudens is necessarily apocryphal. It is not, as is popularly supposed, enclosed in Bernini's bronze chair, but is kept under triple lock and exhibited only once in a century.

Byzantium, like Greece and Rome, affected the curule form of chair, and in addition to lions' heads and winged figures of Victory and dolphin-shaped arms used also the lyre-back which has been made familiar by the pseudo-classical revival of the end of the 18th century. The chair of Maximian in the cathedral of Ravenna is believed to date from the middle of the 6th century. It is of marble, round, with a high back, and is carved in high relief with figures of saints and scenes from the Gospels—the Annunciation, the Adoration of the Magi, the flight into Egypt, and the baptism of Christ. The smaller spaces are filled with carvings of animals,

birds, flowers and foliated ornament. Another very ancient seat is the so-called "Chair of Dagobert" in the Louvre. It is of cast bronze, sharpened with the chisel and partially gilt; it is of the curule or faldstool type and supported upon legs terminating in the heads and feet of animals. The seat, which was probably of leather, has disappeared. Its attribution depends entirely upon the statement of Suger, abbot of St. Denis in the 12th century, who added a back and arms. Its age has been much discussed, but Viollet-le-Duc dated it to early Merovingian times.

To the same generic type belongs the famous abbots' chair of Glastonbury; such chairs might readily be taken to pieces when their owners travelled. The *faldsternium* in time acquired arms and a back, while retaining its folding shape. The most famous, as well as the most ancient, English chair is that made at the end of the 13th century for Edward I., in which most subsequent monarchs have been crowned. It is of an architectural type and of oak, and was covered with gilded *gesso* which long since disappeared.

BY COURTESY OF THE METROPOLITAN MUSEUM OF ART
SPANISH ARMCHAIR OF THE 17TH CENTURY, HEAVY IN CONSTRUCTION AND ELABORATELY CARVED

Transition.—Passing from these historic examples we find the chair monopolized by the ruler, lay or ecclesiastical, to a comparatively late date. As the seat of authority it stood at the head of the lord's table, on his dais, by the side of his bed. The seigneurial chair, commoner in France and the Netherlands than in England, is a very interesting type, approximating in many respects to the episcopal or abbatial throne or stall. It early acquired a very high back and sometimes had a canopy. Arms were invariable, and the lower part was closed in with panelled or carved front and sides—the seat, indeed, was often hinged and sometimes closed with a key. That we are still said to sit "in" an arm-chair and "on" other kinds of chairs is a reminiscence of the time when the lord or seigneur sat "in his chair." These throne-like seats were always architectural in character, and as Gothic feeling waned took the distinctive characteristics of Renaissance work. It was owing in great measure to the Renaissance that the chair ceased to be an appanage of state, and became the customary companion of whomsoever could afford to buy it. Once the idea of privilege faded the chair speedily came into general use, and almost at once began to reflect the fashions of the hour. No other piece of furniture has ever been so close an index to sumptuary changes. It has varied in size, shape and sturdiness with the fashion of women's dress as well as men's. Thus the chair which was not, even with its arms purposely suppressed, too ample during the several reigns of some form or other of hoops and farthingale, became monstrous when these protuberances disappeared. Again, the costly laced coats of the dandy of the 18th and early 19th centuries were so threatened by the ordinary form of seat that a "conversation chair" was devised, which enabled the buck and the ruffler to sit with his face to the back, his valuable tails hanging unimpeded over the front. The early chair almost invariably had arms, and it was not until towards the close of the 16th century that the smaller form grew common.

The 17th Century.—The majority of the chairs of all countries until the middle of the 17th century were of oak without upholstery, and when it became customary to cushion them, leather was sometimes employed; subsequently velvet and silk were extensively used, and at a later period cheaper and often more durable materials. Leather was not infrequently used even for the costly and elaborate chairs of the faldstool form—occasionally sheathed in thin plates of silver—which Venice sent all over Europe. To this day, indeed, leather is one of the most frequently employed materials for chair covering. The outstanding characteristic of most chairs until the middle of the 17th century was massiveness and solidity. Being usually made of oak, they were of considerable weight, and it was not until the introduction of the handsome

Louis XIII. chairs with cane backs and seats that either weight or solidity was reduced. Although English furniture derives so extensively from foreign and especially French and Italian models, the earlier forms of English chairs owed but little to exotic influences.

This was especially the case down to the end of the Tudor period, after which France began to set her mark upon the British chair. The squat variety, with heavy and sombre back, carved like a piece of panelling, gave place to a taller, more slender, and more elegant form, in which the framework only was carved, and attempts were made at ornament in new directions. The stretcher especially offered opportunities which were not lost upon the cabinet-makers of the Restoration. From a mere uncompromising cross-bar intended to strengthen the construction, it blossomed into an elaborate scroll-work or an exceedingly graceful semi-circular ornament connecting all four legs, with a vase-shaped knob in the centre. The arms and legs of chairs of this period were scrolled, the splats of the back often showing a rich arrangement of spirals and scrolls. This most decorative of all types appears to have been popularized in England by the cavaliers who had been in exile with Charles II. and had become familiar with it in the north-western parts of the European Continent.

During the reign of William and Mary these charming forms degenerated into something much stiffer and more rectangular, with a solid, more or less fiddle-shaped splat and a cabriole leg with pad feet. The more ornamental examples had cane seats and ill-proportioned cane backs. From these forms was gradually developed the Chippendale chair, with its elaborately interlaced back, its graceful arms and square or cabriole legs, the latter terminating in the claw and ball or the pad foot. Hepplewhite, Sheraton and Adam all aimed at lightening the chair, which, even in the master hands of Chippendale, remained comparatively heavy. The endeavour succeeded, and the modern chair is everywhere comparatively slight. Chippendale and Hepplewhite between them determined what appears to be the final form of the chair, for since their time practically no new type has lasted, and in its main characteristics the chair of the 20th century is the direct derivative of that of the later 18th.

The 18th century was, indeed, the golden age of the chair, especially in France and England, between which there was considerable give and take of ideas. Diderot could not refrain from writing of them in his *Encyclopédie*. The typical Louis Seize chair, oval-backed and ample of seat, with descending arms and round-reeded legs, covered in Beauvais or some such gay tapestry woven with Boucher or Watteau-like scenes, is a very gracious

FROM ELLWOOD, "FURNITURE AND DECORATION"

CHIPPENDALE CHAIRS, WHICH IN THE 18TH CENTURY REPLACED THE HEAVIER MODELS OF TRADITION

object, in which the period reached its high-water mark. The Empire brought in squat and squabby shapes, comfortable enough no doubt, but entirely destitute of inspiration. English Empire chairs were often heavier and more sombre than those of French design. Thenceforward the chair in all countries ceased to attract the artist. The *art nouveau* school has occasionally produced something of not unpleasing simplicity; but more often its efforts have been frankly ugly or even grotesque. There have been practically no novelties. So much, indeed, is the present indebted to the past in this matter that even the revolving chair, now so

CHAIRS OF THE 15TH TO THE 18TH CENTURY

1. Italian Renaissance armchair
2. Spanish Renaissance armchair
3. Italian "Dante" chair, 16th century

4. Italian Renaissance armchair
5. Louis XV. armchair. Gilded wood
6. Louis XVI. armchair

7. Chinese Chippendale, 1775-80
8. Hepplewhite chair, 1780-85
9. Chippendale ladder back, 1760-70

familiar in offices, has a pedigree of something like four centuries (see also INTERIOR DECORATION; FURNITURE). (J. P.-B.)

CHAISE, a light two- or four-wheeled carriage with a movable hood or "calash" (the French for "chair," through a transference from a "sedan-chair" to a wheeled vehicle). The "post-chaise" was the fast-travelling carriage of the 18th and early 19th centuries. It was closed and four-wheeled for two or four horses and with the driver riding postillion.

CHAITANYA, Indian mystic, was born in 1486 at Navadvip, Bengal (died c. 1534). He was educated at the pathshala, or primary school of Navadvip and at eight years of age entered the Sanskrit tol. At an early age he became proficient in Sanskrit grammar and rhetoric. He initiated a popular religious movement within the Vaishnava faith (a cult of Vishnu). Chaitanya emphasized the path of bhakti (of devotion and direct relation to God) in contrast to the priestcraft and religious convention of the day. The Chaitanya Vaishnavas are a distinct religious sect in India to-day and the sankirtan (chorus singing accompanied by drums and symbols), emphasized and developed by Chaitanya, still forms the centre of its religious rites.

CHAKMA, a tribe in India, of mixed origin, probably the descendants of prisoners taken by the Arakanese from the Mogul armies who were provided with Magh, Mon or Arakanese wives. It migrated from the southern portion of the Chittagong coastal plain towards the end of the 18th century and is now settled on the middle reaches of the Karnaphuli and its tributaries in the Chittagong Hills tracts. The language is a dialect of Bengali, but the old script, now falling into disuse, is closely allied to the ancient Khmer script. The men dress in Bengali style, but the women wear a distinctive long blue skirt with a red border, and after puberty a strip of silk over the breasts. The religion is Animism, with a thin veneer of Buddhism. The dead are burned on the banks of streams. The tribe is divided into patrilineal endogamous clans, but the power of the heads of the separate clans has in course of time been absorbed by one family, the head of whom is known as the Chakma chief. Despite strong and prolonged Bengali influence the underlying culture is Burmese or Mon. Only of recent years is shifting cultivation being gradually abandoned for plough cultivation. The houses are flimsily built on piles and the villages are invariably on the banks of streams.

See T. H. Lewin, *Hill Tracts of Chittagong and Dwellers Therein* (Calcutta, 1869); G. A. Grierson, *Linguistic Survey of India*, vol. v., part 9. (J. P. M.)

CHAKRATA, a small mountain cantonment in the Dehra Dun district of the United Provinces of India, on the range of hills overlooking the valleys of the Jumna and the Tons, at an elevation of 7,000 ft.

CHALCEDON, more correctly **CALCHEDON**, an ancient maritime town of Bithynia, in Asia Minor, almost directly opposite Byzantium, south of Scutari. It was a Megarian colony founded on a site so obviously inferior to that which was within view on the opposite shore, that it received from the oracle the name of "the City of the Blind." In its early history it shared the fortunes of Byzantium, vacillated long between the Lacedaemonian and the Athenian interests, and was at last bequeathed to the Romans by Attalus III. of Pergamum (133 B.C.). It was partly destroyed by Mithridates, but recovered during the Empire, and in A.D. 451 was the seat of the Fourth General Council. It fell under the repeated attacks of the barbarian hordes who crossed over after having ravaged Byzantium, and furnished an encampment to the Persians under Chosroes, c. 616–626. The Turks used it as a quarry for building materials for Constantinople. To the south are the ruins of Panteichion, where Belisarius is said to have lived in retirement.

See J. von Hammer, *Constantinopolis* (Pesth, 1822); Murray's *Handbook for Constantinople* (London, 1900).

CHALCEDON, COUNCIL OF, the fourth oecumenical council of the Catholic Church, was held in 451, its occasion being the Eutychian heresy and the notorious "Robber Synod" (see EUTYCHES and EPHEBUS, COUNCIL OF), which called forth vigorous protests both in the East and West, and a loud demand for a new general council, a demand that was ignored by the Eutychian

Theodosius II., but speedily granted by his successor, Marcian. In response to the imperial summons, 500 to 600 bishops, all Eastern, except the Roman legates and two Africans, assembled in Chalcedon on Oct. 8, 451. The bishop of Rome claimed for his legates the right to preside, and insisted that any act that failed to receive their approval would be invalid. The first session was tumultuous; party feeling ran high, and scurrilous epithets were bandied to and fro. The acts of the Robber Synod were examined; fraud, violence and coercion were charged against it; its entire proceedings were annulled, and, at the third session, its leader, Dioscurus, was deposed and degraded. The emperor requested a declaration of the true faith; but the sentiment of the council was opposed to a new symbol. It contented itself with reaffirming the Nicene and Constantinopolitan creeds and the Ephesine formula of 431, and accepting, only after examination, the Christological statement contained in the *Epistola Dogmatica* of Leo I. (q.v.) to Flavianus. Thus the council rejected both Nestorianism and Eutychianism, and stood upon the doctrine that Christ had two natures, each perfect in itself and each distinct from the other, yet perfectly united in one person, who was at once both God and man. With this statement, which was formally subscribed in the presence of the emperor, the development of the Christological doctrine was completed, but not in a manner to obviate further controversy (see MONOPHYTES and MONOTHELITES).

The remaining sessions were occupied with matters of discipline, episcopal jurisdiction, organization of diocese and parish, occupations of the clergy and the like; and confirmed the third canon of the second oecumenical council, which accorded to Constantinople equal privileges (*ἴσα πρεσβεία*) with Rome, and the second rank among the patriarchates, and, in addition, granted to Constantinople patriarchal jurisdiction over Pontus, Asia and Thrace. The Roman legates, who were absent (designedly?) when this famous (xxviii.) canon was adopted, protested against it, but in vain, the imperial commissioners deciding in favour of its regularity and validity. Leo I., although he recognized the council as oecumenical and confirmed its doctrinal decrees, rejected canon xxviii. on the ground that it contravened the 6th canon of Nicaea and infringed the rights of Alexandria and Antioch. In what proportion zeal for the ancient canons and the rights of others, and jealous fear of encroachment upon his own jurisdiction, were mixed in the motives of Leo, it would be interesting to know. The canon was universally received in the East (see CONSTANTINOPLE, COUNCILS OF).

The emperor Marcian approved the doctrinal decrees of the council and enjoined silence in regard to theological questions. Eutyches and Dioscurus and their followers were deposed and banished.

See Hefele, *Church Councils* (2nd ed.) ii. pp. 394–578 (Eng. trans., iii. pp. 268–464); also bibliographies in Herzog-Hauck, *Realencyklopädie*, 3rd ed., s.v., "Eutyches" (by Loofs) and s.v. "Nestorianer" (by Kessler); and the general histories of Christian Doctrine.

CHALCEDONY or **CALCEDONY**, a variety of native silica occurring in concretionary, mammillated or stalactitic forms of waxy lustre and a great variety of colours—though usually white, grey, yellow or brown. It has a compact fibrous structure and a fine splintery fracture. Its relation to quartz has been the subject of a long controversy; one theory supposed it to be a mixture of quartz and opal, whilst the other held that it was a mineral distinct from quartz. Chalcedony fibres are usually, though not invariably, uniaxial and positive, but differ from quartz in that the optic axis is perpendicular to the length. Further, the refractive indices, double refraction, specific gravity and hardness are all slightly less for chalcedony than for quartz. The fine-structure of the two minerals must, however, be very similar for their X-ray powder-photographs are identical. This result, which favours the view that chalcedony is a mixture of quartz and opal, is further supported by optical considerations; for by assigning reasonable values to the density, refractive index and amount of the opal supposed to be present, it is possible to account for all the characters of chalcedony.

Chalcedony occurs in veins and amygdaloids of volcanic rocks

together with zeolites and other hydrated silicates. It is deposited from residual magmatic solutions as well as being entirely secondary. In this mode of occurrence it is a common mineral in many volcanic fields, as in the basalts of northern Ireland, the Faroe islands, Iceland, the Deccan (India). Chalcedonic pseudomorphs after other minerals often give rise to very interesting specimens. The name "enhydro" is given to hollow nodules of chalcedony containing water and an air bubble which is visible through the semi-transparent wall. In all ages chalcedony has been the stone most used by the gem engraver, and many coloured varieties, described under special headings, are still cut and polished as ornamental stones. (See AGATE, BLOODSTONE, CARNELIAN, CHRYSOPRASE, HELIOTROPE, MOCHA STONE, ONYX, SARD and SARDONYX.) (W. A. W.)

CHALCIS, the chief town of the island of Euboea in Greece, is situated on the strait of the Euripus at its narrowest point. Ancient Chalcis was peopled by Ionians, and early developed great industrial and colonizing activity. In the 7th and 8th centuries it founded thirty townships on the peninsula of Chalcidice, and several important cities in Sicily (*q.v.*). Its metal-work, purple and pottery found markets among these settlements, and were distributed widely in the ships of its allies Corinth and Samos. In the so-called Lelantine War, Chalcis won from its neighbour and rival Eretria the best agricultural district of Euboea and became the chief city of the island. But its prosperity was broken by disastrous wars with the Athenians, and it became a member of both the Delian Leagues. In the Hellenistic period it was one of the fortresses by which Macedon controlled Greece. Antiochus III. of Syria (192) and Mithradates VI. of Pontus (88) used it as a base for invading Greece. Under Roman rule Chalcis retained some commercial prosperity; after the 6th century A.D. it again served to protect central Greece against northern invaders. From 1209 it was under Venetian control; in 1470 it passed to the Ottoman Turks, who made it the seat of a pasha. In 1688 it was successfully held against Venetian attack. The modern town has considerable export trade and railway connection with Athens and Peiraeus (1904). The old walled Castro, towards the Euripus, is inhabited by Jewish and Turkish families; the modern suburb outside it, by Greeks. A part of the Castro was destroyed by the earthquake of 1894; part, the famous "Black Bridge," which gave its mediaeval name "Negroponte" to Euboea, has been replaced by a modern swing bridge in the widening of the Euripus. The church of St. Paraskeve, once the chief church of the Venetians, dates from the Byzantine period, though many of its details are Western. The Turkish mosque is now a guard-house.

CHALCOCITE, a mineral consisting of cuprous sulphide (Cu_2S), crystallizing in the orthorhombic system. It is known also as copper-glance, redruthite and vitreous copper. The crystals have the form of six-sided tables or prisms which are usually twinned, with the result that they simulate hexagonal symmetry. The mineral more often occurs as compact masses, which are sometimes of considerable extent. The colour is dark lead-grey with a metallic lustre, but this is never very bright, since the material is readily altered, becoming black and dull on exposure to light. The mineral is soft ($H. = 2\frac{1}{2}$) and sectile and can be readily cut with a knife; specific gravity 5.7.

Next to chalcopyrite, chalcocite is the most important ore of copper, and is perhaps the most characteristic mineral of the zone of secondary enrichment. It seems probable however that at some localities, *e.g.*, Butte, Mont., it is of primary origin. The best crystals are from St. Just, St. Ives and Redruth in Cornwall, and from Bristol in Connecticut.

CHALCONDYLES (or **CHALCOCONDYLAS**), **LAONICUS**, the only Athenian Byzantine writer. He wrote a history, in ten books, of the period from 1208–1463, describing the fall of the

Greek empire and the rise of the Ottoman Turks, down to the conquest of the Venetians and Mathias, king of Hungary, by Mohammed II. The capture of Constantinople he rightly regarded as an event of far-reaching importance. The work incidentally gives an interesting sketch of the civilization of England, France and Germany, whose assistance the Greeks sought against the Turks. Chalcondyles' chronology is defective, and his use of the old Greek place-names causes confusion.

Editio princeps, ed. J. B. Baumbach (1615); in Bonn *Corpus Scriptorum Hist. Byz.* ed. I. Bekker (1843); Migne, *Patrologia Graeca*, clix. There is a French translation by Blaise de Vigenère (1577, later ed. by Artus Thomas with valuable illustrations on Turkish matters); see also F. Gregorovius, *Geschichte der Stadt Athen im Mittelalter*, ii. (1880); Gibbon, *Decline and Fall*, ch. 66; C. Krumbacher, *Geschichte der byzantinischen Literatur* (1897). There is a biographical sketch of Laonicus and his brother in Greek by Antonius Calosynas, a physician of Toledo, who lived in the latter part of the 16th century (see C. Hopf, *Chroniques gréco-romanes*, 1873).

His brother, **DEMETRIUS CHALCONDYLES** (1424–1511), was born in Athens. In 1447 he went to Italy, where Cardinal Bessarion became his patron. He became famous as a teacher of Greek and the Platonic philosophy; in 1463 he was made professor at Padua, and in 1479 was summoned by Lorenzo de' Medici to Florence. In 1492 he removed to Milan, where he died in 1511. He was associated with Marsilius Ficinus, Angelus Politianus and Theodorus Gaza, in the revival of letters in the western world. One of his pupils at Florence was the famous John Reuchlin. Demetrius Chalcondyles published the editio princeps of Homer (1488), Isocrates (1493) and Suidas (1499), and a Greek grammar (*Erotemata*) in the form of question and answer.

BIBLIOGRAPHY.—See H. Hody, *De Graecis illustribus* (1742); C. Hopf, *Chroniques gréco-romanes* (1873); E. Legrand, *Bibliographie hellénique*, i. (1885).

CHALCOPYRITE or **COPPER-PYRITES**, a copper iron sulphide (CuFeS_2), an important ore of copper.

Chalcopyrite crystallizes in the tetragonal system with inclined hemihedrism, but the form is so nearly cubic that it was not recognized as tetragonal until accurate measurements were made in 1822. Crystals are usually tetrahedral in aspect but frequently twinned, and they are often complex and difficult to decipher. The fracture is conchoidal, and the material is brittle. Hardness 4; specific gravity 4.2. The colour is brass-yellow, and the lustre metallic; the streak, or colour of the powder, is greenish-black. The mineral is especially liable to surface alteration, tarnishing with beautiful iridescent colours; a blue colour usually predominates, owing probably to the alteration of the chalcopyrite to covellite (CuS).

Chalcopyrite may be readily distinguished from pyrite (or iron-pyrites), which it somewhat resembles in appearance, by its deeper colour and lower degree of hardness: the former is easily scratched by a knife, whilst the latter can only be scratched with difficulty or not at all. Chalcopyrite is decomposed by nitric acid with separation of sulphur and formation of a green solution; ammonia added in excess to this solution changes the green colour to deep blue and precipitates red ferric hydroxide.

The chemical formula CuFeS_2 corresponds with the percentage composition $\text{Cu}=34.5$, $\text{Fe}=30.5$, $\text{S}=35.0$. Analyses usually, however, show the presence of more iron, owing to the intimate admixture of pyrite. Traces of gold, silver, selenium or thallium are sometimes present, and the mineral is sometimes worked as an ore of gold or silver, which are present in solid solution.

Chalcopyrite is of wide distribution and is the commonest of the ores of copper. Extensive deposits are mined in the United States, particularly at Butte in Montana, and in Namaqualand, South Africa. Well-crystallized specimens are met with at many localities; for example, formerly at Wheal Towan (hence the name towanite, which has been applied to the species) in the St. Agnes district of Cornwall, at Freiberg in Saxony, and Joplin, Missouri. (L. J. S.)

CHALDAEA. The expressions "Chaldaea" and "Chaldaeans" are frequently used in the Old Testament as equivalents for "Babylonia" and "Babylonians." Chaldaea was really the name of a country, used in two senses. It was first applied to the extreme southern district, whose ancient capital was the city of *Bt*

Yakin, the chief seat of the renowned Chaldaean rebel Merodach-baladan, who harassed the Assyrian kings Sargon and Sennacherib. It is not as yet possible to fix the exact boundaries of the original home of the Chaldaeans, but it may be regarded as having been the long stretch of alluvial land situated at the then separate mouths of the Tigris and Euphrates, which rivers now combine to flow into the Persian Gulf in the waters of the majestic *Shatt el-Arab*.

The name "Chaldaea," however, soon came to have a more extensive application. In the days of the Assyrian king Adad-nirāri III. (811-782 B.C.), the term *mat Kaldū* covered practically all Babylonia. Furthermore, Merodach-baladan was called by Sargon II. (722-705 B.C.) "king of the land of the Chaldaeans" and "king of the land of Bit Yakin" after the old capital city; but there is no satisfactory evidence that Merodach-baladan had the right to the title "Babylonian." The racial distinction between the Chaldaeans and the Babylonians proper seems to have existed until a much later date. That they differed from the Arabs and Aramaeans appears to follow from the distinction made by Sennacherib (705-681 B.C.) between the Chaldaeans and these races. Later, during the period covering the fall of Assyria and the rise of the Neo-Babylonian empire, the term *mat Kaldū* was not only applied to all Babylonia, but also embraced the territory of certain foreign nations who were later included by Ezekiel (xxiii. 23) under the expression "Chaldaeans."

The Chaldaeans probably first came from Arabia, the supposed original home of the Semitic races, at a very early date along the coast of the Persian Gulf and settled in the neighbourhood of Ur ("Ur of the Chaldees," Gen. xi. 28), whence they began a series of encroachments, partly by warfare and partly by immigration, against the other Semitic Babylonians. These aggressions after many centuries ended in the Chaldaean supremacy of Nabopolassar and his successors (from c. 625), although there is no positive proof that Nabopolassar was purely Chaldaean in blood. The sudden rise of the later Babylonian empire under Nebuchadnezzar, the son of Nabopolassar, must have tended to produce so thorough an amalgamation of the Chaldaeans and Babylonians, who had theretofore been considered as two kindred branches of the same original Semite stock, that in the course of time no perceptible differences existed between them. The language of these Chaldaeans differed in no way from the ordinary Semitic Babylonian idiom which was practically identical with that of Assyria. Consequently, the term "Chaldaean" came quite naturally to be used in later days as synonymous with "Babylonian," and through a misunderstanding the term *Chaldee* (q.v.) was subsequently applied to the Aramaic language.

The derivation of the name "Chaldaean" is uncertain. It is probably connected with the Semitic stem *kasādu* (conquer), in which case *Kaldi-Kašdi*, with the well-known interchange of *l* and *š*, would mean "conquerors." It is also possible that *Kašdu-Kaldū* is connected with the proper name Cheshed, who is represented as having been the nephew of Abraham (Gen. xxii. 22). But there is no connection between the Black sea people called "Chaldaeans" by Xenophon (*Anab.* vii. 25) and the Chaldaeans of Babylonia. (For *Chaldians* see URARTU.)

In Daniel, the term "Chaldaeans" commonly means "astrologers, astronomers," as it also does in the classical authors (Herodotus, Strabo, Diodorus, etc.). In Daniel i. 4, by the expression "tongue of the Chaldaeans," the writer evidently meant the language in which the celebrated Babylonian works on astrology and divination were composed. It is now known that the literary idiom of the Babylonian wise men was the non-Semitic Sumerian; but it is not probable that the late author of *Daniel* (q.v.) was aware of this fact. The word "Chaldaean" is applied as a race-name to the Babylonians (Dan. iii. 8, v. 30, ix. 1); but the expression is used oftener, either as a name for some special class of magicians, or as a term for magicians in general (ix. 1). The transfer of the name of the people to a special class can perhaps be explained. When in later times "Chaldaean" and "Babylonian" became practically synonymous, the term "Chaldaean" lived on in the secondary restricted sense of "wise men." The early *Kaldi* had seized and held from very ancient times the

region of old Sumer, which was the centre of the primitive non-Semitic culture. It seems extremely probable that these Chaldaean Semites were so strongly influenced by the foreign civilization as to adopt it eventually as their own. Then, as the Chaldaeans soon became the dominant people, the priestly caste of that region developed into a Chaldaean institution. It is reasonable to conjecture that southern Babylonia, the home of the old culture, supplied Babylon and other important cities with priests, who from their descent were correctly called "Chaldaeans." This name in later times, owing to the racial amalgamation of the Chaldaeans and Babylonians, lost its former national force, and became, as it occurs in Daniel, a distinctive appellation of the Babylonian priestly class. *Kalū* (priest) in Babylonian, which has no etymological connection with *Kaldū*, may have contributed paronomastically towards the popular use of the term "Chaldaeans" for the Babylonian magi. (See also ASTROLOGY.)

See BABYLONIA AND ASSYRIA and SUMER AND SUMERIAN; and the commentaries on the book of Daniel. (J. D. Pr.)

CHALDEE, a term formerly applied to the Aramaic portions of the biblical books of Ezra and Daniel or to the vernacular paraphrases of the Old Testament (see TARGUM), on the assumption that the language was that of Chaldaea (q.v.). But the cuneiform inscriptions show that the language of the Chaldaeans was Assyrian; and it is now known that the substitution of Aramaic for Hebrew as the vernacular of Palestine took place very gradually. The dialect wrongly called "Chaldee" is really the language of the South-Western Arameans, who were the immediate neighbours of the Jews. See SEMITIC LANGUAGES.

CHALDER or **CHALDRON**, an old dry measure of capacity, usually called chalder in Scotland and chaldron in England. In Scotland the chalder was equivalent to 16 bolls (q.v.) of corn, and was used in computing the stipends of parish ministers, but, like the chaldron, it varied according to the locality and the commodity measured. As a measure for lime and coal, the chalder and the chaldron vary from 32 bushels upwards, and are in general equivalent in weight to about 25½ cwt.

CHALET, a term applied to the timber houses of Switzerland, the Bavarian Alps, Tirol and the French Alps. The chalet is distinguished above all by the frank and interesting manner in which it makes use of its material, wood. The timber used is generally in heavy planks, from 3 to 6 in. thick, and carefully framed together somewhat in the manner of a log-house. Side walls, generally low, often project beyond the ends, forming porches or loggias, closed at the ends. Upper floors, almost universally, project over the storeys below, with all sorts of fantastic

BY COURTESY OF BURTON HOLMES

CHARACTERISTIC CHALET IN THE AUSTRIAN TIROL

and interesting bracket treatments. Balconies across the front are common and are frequently enriched with carved railings. Windows are small and hung as casements. In general, roofs are of low pitch and project enormously, both at the eaves and at the gable ends, which are occasionally snubbed with a small triangle of sloping roof at the top. The roof surfaces are covered with large wood shingles, slabs of slate or stone; in the wilder districts planks are often laid over the roof covering and weighted with

boulders to prevent damage from heavy gales. In plan, the chalet tends towards the square; frequently, not only the house proper, but stables and storage barns are included under one enormous roof. Many local peculiarities of detail exist. (See HOUSE.)

CHALIAPIN, FYODOR IVANOVICH (1873-), (shahl-yah'pën) Russian bass singer, born at Kazan, on Feb. 15, 1873. His early career was a varied and adventurous one; he was by turns porter, shoemaker, hunter and street sweeper. He received his first musical training as a choirboy at Kazan, but his serious studies as a singer were made under Oussatov at Tiflis, where he made his first appearance in opera in 1892 in *A Life for the Tsar*. He then sang in 1894 at the Summer theatre, St. Petersburg (Leningrad), and later at the Imperial opera house. After visiting Milan he took important parts in the Mamantoff opera company, and at a private opera house in Moscow in 1896. In 1913, during the Russian opera season organized by Sir Thomas Beecham at Drury Lane, London, he appeared in *Boris Godunov*, *Ivan the Terrible*, and *La Khovantchina*. His superb bass voice and remarkable dramatic powers took his audience by storm, and he had a similar success in *Prince Igor*. During the World War and afterwards, until 1921, he remained in Russia. His first appearance outside Russia after the war was at the Albert Hall, London, in 1921. He had visited America in 1908; his second tour there was in 1922-23. Among his most famous parts may be named those of Ivan the Terrible in Rimsky-Korsakov's *Maid of Pskov*; Salieri in *Mozart and Salieri*; Leporello in *Don Giovanni*; Don Basilio in the *Barber of Seville*; and Mephisto in *Mefistofele*.

See his *Pages from my Life* (1927).

CHALICE, the cup used in the celebration of the Eucharist (q.v.). For the various forms which the chalice so used has taken, see DRINKING-VESSLS. The ancient custom of mixing water with wine in the Eucharistic service, practised from early times in both Eastern (except the Armenian) and Western Churches, is known as that of the "mixed chalice." The practice has been generally discontinued since the Reformation in the English Church, but is not illegal if it is not done ceremonially (*Martin v. Mackonochie*, 1868, L.R. 2 P.C. 365; *Read v. Bp. of Lincoln*, 1892, A.C. 664).

CHALIER, MARIE JOSEPH (1747-1793), French revolutionary, became a partner in a business firm at Lyons for which he travelled in the Levant, in Italy, Spain and Portugal. He became the orator and leader of the Jacobins of Lyons, and induced the other revolutionary clubs and the commune of the city to arrest a great number of Royalists in the night of Feb. 5, 1793. The mayor, supported by the national guard, opposed this project. Chalier demanded of the Convention the establishment of a revolutionary tribunal and the levy of a revolutionary army at Lyons. The Convention refused, and the anti-revolutionary party, encouraged by this refusal, took action. On May 29-30, 1793, the sections rose; the Jacobins were dispossessed of the municipality and Chalier arrested. On July 15, in spite of the order of the Convention, he was brought before the criminal tribunal of the Rhone-et-Loire, condemned to death, and guillotined the next day.

See N. Wahl, "Étude sur Chalier," in *Revue historique*, t. xxxiv; and *Les Premières Années de la Révolution à Lyon* (1894).

CHALK is a white or greyish, loosely coherent kind of limestone rock, composed almost entirely of the calcareous remains of minute marine organisms (foraminifera, coccoliths, etc.) and fragments of shells. The purest kinds contain up to 99% of calcium carbonate in the form of the mineral calcite. Silica is always present in small amounts as the mineral opal, representing the remains of other minute marine organisms and sponge spicules. Minute grains of quartz, feldspar, zircon, rutile and other minerals are also present. With the admixture of clayey material there may be an insensible gradation from pure chalk to chalk-marl. Not only may there be considerable variation in the composition of chalk (phosphatic, glauconitic, etc.) but there may also be wide variations in the colour (snow-white, grey, etc.) and the texture of the material. It may be soft, incoherent and porous or quite hard and crystalline.

The uses of chalk are numerous; for example, as a writing

material in the form of white and coloured crayons, for the manufacture of quicklime, mortar, Portland cement (see CEMENT), plaster and as a fertilizer. Whiting is prepared by grinding chalk and collecting the finer sediments from water; this is used for polishing, making putty and many other purposes. Under the name of "Paris White," chalk is used in the manufacture of india-rubber goods, oil-cloth, wall-paper, etc. The harder kinds are extensively used as a building stone.

Large quantities of chalk are quarried in England in Kent, Surrey, Sussex, Cambridgeshire, Lincolnshire and Hampshire, Kent being by far the most important. The production of English chalk is not far short of five million tons annually. A certain amount of this is exported to the United States, though there are extensive beds of chalk in Kansas, Arkansas and Texas.

CHALKHILL, JOHN (fl. 1600?), English poet. Two songs by him are included in Izaak Walton's *Compleat Angler*, and in 1683 appeared "Thealma and Clearchus. A Pastoral History in smooth and easie Verse. Written long since by John Chalkhill, Esq., an Acquaintant and Friend of Edmund Spencer," together with a preface written five years earlier by Walton. Another poem, "Alcilia, Philoparthen's Loving Follie" (1595, reprinted in vol. x. of the *Jahrbuch des deutschen Shakespeare-Vereins*), was at one time attributed to him. Nothing further is known of the poet, but a person of his name occurs as one of the coroners for Middlesex in the later years of Queen Elizabeth's reign. Professor Saintsbury, who included *Thealma and Clearchus* in vol. ii. of his *Minor Poets of the Caroline Period* (Oxford, 1906), points out a marked resemblance between his work and that of William Chamberlayne.

CHALKING THE DOOR, a former Scottish custom of tenant eviction within burgh. The law was that "a burgh officer, in presence of witnesses, chalks the most patent door 40 days before Whit Sunday, having made out an execution of 'chalking,' in which his name must be inserted, and which must be subscribed by himself and two witnesses." This ceremony proceeded simply on the verbal order of the proprietor. The Removal Terms (Scotland) Act 1886 introduced, as optional to "chalking," the procedure of giving notice to remove by registered letter posted to the last known address of the tenant. The Sheriff Courts (Scotland) Act 1907 requires written notice of removal to be given to the tenant as a prerequisite of ejection, and "chalking the door" is now an obsolete practice.

CHALLEMEL-LACOUR, PAUL AMAND (1827-1896), French statesman, was born at Avranches on May 19, 1827. Educated at the École Normale Supérieure, he became professor of philosophy at Pau and at Limoges, but was obliged to leave France after the coup d'état of 1851. He settled in Zürich, where he became professor of French literature in 1856. Three years later the amnesty permitted his return to France. Appointed by the government of national defence prefect of the Rhone in 1870, he suppressed the communard rising at Lyons directed by Bakunin. He became a deputy to the National Assembly in 1872, and in 1876 a member of the Senate. Though Challemlacour sat at first on the extreme Left, he modified his opinions as time went on, and towards the close of his career was a foremost representative of moderate republicanism. He was French ambassador at Berne (1879), London (1880), minister of foreign affairs in the Jules Ferry cabinet (for some months in 1883), vice-president of the Senate (1890), president of the Senate (1893). His close and reasoned eloquence made him one of the most conspicuous members of the Senate. He died in Paris on Oct. 26, 1896.

See *Oeuvres oratoires de Challemlacour* (1897) and *Études et réflexions d'un Pessimiste* (1901), edited by J. Reinach. See also H. Defasse, *Challemlacour*.

CHALLENGE: see DUEL, JURY.

"CHALLENGER" EXPEDITION. The scientific results of several short expeditions between 1860 and 1870 encouraged the commissioning of a vessel for a prolonged cruise for oceanic exploration. H.M.S. "Challenger," a wooden corvette of 2,300 tons, under Captain (afterwards Sir) George Nares with a scientific staff under Prof. (afterwards Sir) C. Wyville Thomson as director, was sent out in Dec. 1872. The staff included John

Murray (afterwards Sir) and H. N. Moseley, biologists; Dr. von Willemoes-Suhm, Commander Tizard and J. Y. Buchanan, chemist and geologist. The Atlantic was crossed several times. From Cape Town south-east and east the ship visited the various islands between 45° and 50° S., reached Kerguelen island in Jan. 1874, and proceeded south about the meridian of 80° east. She was the first steamship to cross the Antarctic Circle; early in March she made for Melbourne. Thence the route led by New Zealand, the Fiji islands, Torres strait, the Banda sea, and the China sea to Hongkong. The western Pacific was then explored northward to Yokohama, after which the "Challenger" struck across the ocean by Honolulu and Tahiti to Valparaiso. She then coasted south, penetrated the Straits of Magellan, touched at Montevideo, recrossed the Atlantic by Ascension and the Azores, and reached Sheerness in May 1876. The "*Challenger*" Report was issued in 50 volumes (London, 1880-95), mainly under Sir John Murray, who succeeded Wyville Thomson in 1882.

See also Lord G. Campbell, *Log Letters from the "Challenger"* (1876); W. J. J. Spry, *Cruise of H. M. S. "Challenger"* (1876); Sir C. Wyville Thomson, *Voyage of the "Challenger," The Atlantic, Preliminary Account of General Results* (1877); J. J. Wild, *At Anchor; Narrative of Experiences afloat and ashore during the Voyage of H.M.S. "Challenger"* (1878); H. N. Moseley, *Notes by a Naturalist on the "Challenger"* (1879).

CHALLIS, a light, all-wool fabric of almost gossamer texture used for women's dressing gowns and children's suits and dresses. Challis is distinguished from all the other muslin-delaine weaves, of which class it is a member, by the tiny romantic designs in which it is printed. These designs are mostly of 18th and 19th century inspiration and show conventionalized versions of dots, rose-buds, violets and other flowers.

CHALLONER, RICHARD (1691-1781), English Roman Catholic prelate, was born at Lewes, Sussex, on Sept. 29, 1691, and educated at the English college at Douai, where he was ordained a priest in 1716, took his degrees in divinity, and was appointed professor in that faculty. In 1730 he was sent to London. The controversial treatises which he published in rapid succession attracted much attention, particularly his *Catholic Christian Instructed* (1737), with its witty reply to Dr. Conyers Middleton's *Letters from Rome, showing an Exact Conformity between Popery and Paganism*. In 1741 Challoner was raised to the episcopal dignity at Hammersmith and nominated coadjutor with right of succession to Bishop Benjamin Petre, vicar-apostolic of the London district, whom he succeeded in 1758. He died on Jan. 12, 1781. Bishop Challoner was the author of numerous controversial and devotional works, including the *Garden of the Soul* (1740?), one of the most popular manuals of devotion. He re-edited the Douai Bible (1749-1750), correcting the obsolete language and orthography. Of his historical works the most valuable is his *Memoirs of Missionary Priests and other Catholics of both Sexes who suffered Death or Imprisonment in England on account of their Religion, from the year 1577 till the end of the reign of Charles II.* (1741, latest ed., 1924) intended as an antidote to Foxe's martyrology. He also published anonymously, in 1745 *Britannia Sancta*, or lives of the British saints, now superseded by that of Alban Butler.

See E. H. Burton, *Life and Times of Bishop Challoner* (1909).

CHALMERS, ALEXANDER (1759-1834), Scottish writer, was born in Aberdeen on March 29, 1759, and died in London on Dec. 19, 1834. He was educated as a doctor, but gave up this profession for journalism, and he was for some time editor of the *Morning Herald*. Besides editions of the works of Shakespeare, Beattie, Fielding, Johnson, Warton, Pope, Gibbon and Bolingbroke, he published *A General Biographical Dictionary* in 32 vols. (1812-17); a *Glossary to Shakespeare* (1797); an edition of Steeven's *Shakespeare* (1809); and the *British Essayists*, beginning with the *Tatler* and ending with the *Observer*, with biographical and historical prefaces and a general index.

CHALMERS, GEORGE (1742-1825), Scottish antiquarian and political writer, was born at Fochabers, Moray, and emigrated to Maryland in 1763, where he practised as a lawyer until the outbreak of the war of American Independence, when he returned to England. In 1786 he was appointed chief clerk to the

privy council, an office which he held until his death in London May 31 1825.

Of some 30 works which he wrote the most important are *Political Annals of the present United Colonies from their Settlement to the Peace of 1763* (1780), drawn from the American State papers, and *Caledonia, An Account, Historical and Typographical, of North Britain* (1807-24). Neither of these is complete. Of the *Political Annals* only one volume was published, bringing the history down to 1688; and *Caledonia* covers only the southern counties of Scotland.

Chalmers wrote biographical sketches of Defoe, Allan Ramsay, Sir David Lyndsay, and others, prefixed to their collected works, and a *Life of Mary Queen of Scots* (1818). He engaged in many literary and historical controversies with Malone, Steevens, Dr. Jamieson, and others.

CHALMERS, GEORGE PAUL (1836-1878), Scottish portrait and landscape painter, was born at Montrose and studied at Edinburgh. The best of his works are "The End of the Harvest" (1873), "Running Water" (1875), and "The Legend" (in the National Gallery, Edinburgh). He became an associate (1867) and a full member (1871) of the Royal Scottish Academy.

CHALMERS, JAMES (1841-1901), Scottish missionary to New Guinea, was born at Ardrishaig in Argyll. He was appointed to Rarotonga in the South Pacific in 1866. After ten years' service he was transferred to New Guinea. Chalmers did much to open up the island, and, with his colleague W. G. Lawes, gave valuable aid in the British annexation of the south-east coast of the island. On April 8, 1901, in company with a brother missionary, Oliver Tomkins, he was killed by cannibals at Goaribari island. R. L. Stevenson has left on record his high appreciation of Chalmers's character and work.

See his *Autobiography and Letters* (1902).

CHALMERS, THOMAS (1780-1847), Scottish divine, was born at Anstruther, Fifeshire, on March 17, 1780. In 1799 he was licensed by the St. Andrews presbytery. After further study at Edinburgh he became assistant to the professor of mathematics at St. Andrews, and was ordained as minister of Kilmany, Fifeshire. In 1808 he published an *Inquiry into the Extent and Stability of National Resources*, a contribution to the discussion created by Bonaparte's commercial policy. His article on "Christianity" in the *Edinburgh Encyclopaedia* enhanced his reputation as an author. In 1815 he became minister of the Tron church, Glasgow, and his reputation as a preacher spread throughout the United Kingdom. A series of sermons on the relation between discoveries of astronomy and the Christian revelation was published in Jan. 1817, and within a year nine editions and 20,000 copies were in circulation. When he visited London Wilberforce wrote, "all the world is wild about Dr. Chalmers."

In Sept. 1819 he became minister of the church and parish of St. John where he was singularly successful in dealing with the problem of poverty. When he undertook the management of the parish its poor cost the city £1,400 per annum, and in four years, the expenditure was reduced to £280 per annum. In 1823, after eight years of work at high pressure he was glad to accept the chair of moral philosophy at St. Andrews, the seventh academic offer made to him during the eight years spent in Glasgow. In Nov. 1828 he was transferred to the chair of theology in Edinburgh.

In 1826 he published a third volume of the *Christian and Civic Economy of Large Towns*, a continuation of work begun at St. John's, Glasgow. In 1832 he published a *Political Economy*, and in 1833 appeared his Bridgewater treatise on *The Adaptation of External Nature to the Moral and Intellectual Constitution of Man*. In 1834 he became leader of the evangelical section of the Scottish Church in the general assembly. In 1841 the movement which ended in the Disruption was rapidly culminating, and Dr. Chalmers found himself at the head of the party which stood for the principle that "no minister shall be intruded into any parish contrary to the will of the congregation." Cases of conflict between the Church and the civil power arose in Auchterarder, Dunkeld and Marnoch; and when the courts made it clear that the Church, in their opinion, held its temporalities on condition of

rendering such obedience as the courts required, the Church appealed to the Government for relief. In Jan. 1843 the Government put a final and peremptory negative on the Church's claims for spiritual independence. On May 18, 1843, 470 clergymen withdrew from the general assembly and constituted themselves the Free Church of Scotland, with Dr. Chalmers as moderator. He had prepared a sustentation fund scheme for the support of the seceding ministers, and this was at once put into successful operation. He himself became principal of the newly founded Free Church college, Edinburgh. On May 30, 1847 immediately after his return from the House of Commons, where he had given evidence as to the refusal of sites for Free Churches, by Scottish landowners, he was found dead in bed.

Dr. Chalmers' writings are a valuable source for argument and illustration on the question of Establishment. They run to 38 volumes concerned with theology, devotional practice and social economy. The most important of them is his *Institutes of Theology* written in his later years at the Free Church college.

CHALONER, SIR THOMAS, the elder (1521-1565), English diplomatist and poet, the son of Roger Chaloner, a mercer of London, was educated at Oxford and Cambridge. In 1540 he went as secretary to Sir Henry Knyvett, to the court of Charles V., whom he accompanied in his expedition to Algiers in 1541. In 1547 Chaloner served in the expedition to Scotland, and was knighted after the battle of Pinckie, by the protector Somerset. He was a witness against Bishop Bonner, in 1549, and against Stephen Gardiner, Bishop of Winchester, in 1551. Sent as a commissioner to Scotland three times (1551, 1552 and 1555-56), he was also employed both by Queen Mary and Elizabeth, as ambassador to France, Belgium and Spain. He returned home in 1564, and died at Clerkenwell on Oct. 14, 1565.

Chaloner's most important works are "Howe the Lorde Mowbray . . . was . . . banyshed the Realme," printed in the 1559 edition of William Baldwin's *Mirror for Magistrates* (repr. in vol. ii., pt. 1 of J. Haslewood's ed., 1815); *De Rep. Anglorum instauranda libri decem*, published by W. Mallim (1579, 3 pts.); and *The praise of folie, Moriae encomium . . . by Erasmus . . . Englished by Sir Thomas Chaloner, Knight* (1549, ed. Janet E. Ashbee, 1901).

CHÂLONS-SUR-MARNE, a town of north-eastern France, capital of the department of Marne, 107 m. E. of Paris on the main line of the Eastern railway to Nancy, and 25 m. S.E. of Reims. Pop. (1926), 26,035. The town proper is bordered on the west by the lateral canal of the Marne and is traversed by branches of the canal and by small streams.

Châlons-sur-Marne occupies the site of the chief town of the Catalauni and, on the plain between it and Troyes, Attila was defeated by the Romans in 451. In the 10th and following centuries it attained great prosperity under its bishops, who were ecclesiastical peers of France. In 1214 the militia of Châlons served at the battle of Bouvines; and in the 15th century the citizens twice repulsed the English from their walls. In the 16th century the town sided with Henry IV., king of France, who in 1589 transferred thither the parliament of Paris, which shortly afterwards burnt the bulls of Gregory XIV. and Clement VIII. The camp of Châlons, about 16 m. N. of the town, was established in 1856 by Napoleon III. and is a training-centre for troops. Châlons was occupied by the Germans in August, 1914, and was retaken by Foch in September, 1914. The cathedral of St. Étienne (chiefly 13th century) has a 17th century west façade. There are stained-glass windows of the 13th century in the north transept. Notre-Dame, of the 12th and 13th centuries, is conspicuous for its four Romanesque towers, two flanking the apse, two flanking the principal façade. The churches of St. Alpin, St. Jean and St. Loup date from various periods between the 11th and 17th centuries. The hôtel-de-ville (1771), the prefecture (1759-1764), the college, once a Jesuit establishment, and a training college which occupies the Augustinian abbey of Toussaints (16th and 17th centuries), are noteworthy civil buildings. The houses are generally ill-built, but some old mansions remain. The town is the seat of a bishop and a prefect, has tribunals of first

instance and of commerce, a chamber of commerce, a board of trade-arbitrators, a museum and a library. The principal industry is brewing, which is carried on in the suburb of Marne. Galleries hewn in a limestone hill are used as store-houses for beer. The preparation of champagne, the manufacture of boots, brushes, wire-goods and wall-paper also occupy many hands. There is trade in cereals. (X.)

Battle of Châlons.—The battle of the Catalaunian Plains, "fierce, manifold, huge, stubborn, without its like in the history of times past" (Priscus), was fought between Attila and the Roman Aëtius in 451 A.D.

The Huns had crossed the Danube in the first quarter of the fifth century. Uldin, their leader was driven back by the soldiers of Byzantium; but by 424 the Byzantine court was paying the Huns a tribute of 350lb. of gold. Some ten years later Attila, nephew of a king who had brought the Huns to some rough unity of predatory purpose, became joint ruler with his brother. Attila, a typical Kalmuck in appearance, thereupon began a career of plunder. In another ten years he had forced the eastern empire to multiply sixfold the annual tribute. In six more years he had become lord of the lands north of the middle and lower Danube, and wasted the northern Balkan country. He forbade his Huns and Germans subject to him to take service in the imperial armies. The western Roman armies had long ceased to find their soldiers from within the frontiers; therefore Attila could cut off one of the main supplies of men.

Aëtius had been no enemy of the Huns, and had used them to make an end of the Burgundian kingdom about Worms (whence the Nibelungenlied). In 450 a good soldier, Marcian, became emperor of the East, and refused to pay the Hunnic tribute. A few months earlier a discontented Roman princess had given Attila a pretext for turning to that quarter of the world which he had not yet plundered. Justa Gratia Honoria, sister of the emperor Valentinian III. had plotted with a lover to take the throne. The plot was discovered; Honoria was married to a respectable and harmless senator. Honoria boldly sent to Attila for help, with her ring to show from what quarter the message came. Attila took the ring to mean that Honoria would be his wife. The time was good for using this claim; Gaiseric, king of the Vandals, fearing an attack from the Visigoths in southwest Gaul, had asked for Attila's alliance.

In 451 Attila led into Gaul a host of Huns, Alans and tributary Germans. Two parties were disputing the kingship of the Franks on the Rhine; one group joined the Huns, and thereby decided Attila's route. On April 7 this host plundered Metz, and thence moved slowly towards Orleans. Aëtius had not crossed the Alps in time to hold the Rhine; nor could he do much without Visigothic help. The fall of Orleans would leave the way open across the Loire to the Visigothic lands; therefore the Visigoths listened to Aëtius' messengers. An army of Romans (that is, of Romanised Germans) and Visigoths marched to save Orleans. Legends of the prowess of a Christian bishop (the legend of St. Geneviève is of the same time) have clouded over the history of the attack upon Orleans. But the town was on the point of falling when Aëtius and Theodoric, the Visigothic king, forced the Huns to retire.

Attila took the road northwards to Troyes and collected his forces on the plains well fitted for his cavalry. Chalons has been named as the chosen battlefield; but the *campi Catalaunici* include most of Champagne. The best chroniclers speak of a certain "Mauriac place." There was a Moirey west of Troyes, and there is a Méry-sur-Seine where bones, weapons and gold ornaments have been found. Here, about sixteen miles north-west of Troyes, some scholars think must be the "Mauriac place" and the tomb of Theodoric. On the night before the battle those Franks who favoured Aëtius broke through to him after a slaughter of 15,000 men. Before the day began Attila took the voice of his augurs; the Huns would be beaten (a likely prophecy about a retreating tribal host), but the enemy leader would fall. Attila could get another army; the empire had not another Aëtius nor would anyone else be likely to keep together the Visigoths and Romans. By delaying until 3 P.M. Attila planned to secure

his retreat in the darkness. The chroniclers say that on one side the field sloped towards a slight hill; for this hill the armies fought. In the place of honour on the Roman right were the Visigoths; on the left Aëtius, and with him as a hostage, Thorismund son of Theodoric; in the centre, enclosed by more trusted troops were the Alan auxiliaries of the Romans. Aëtius hoped that the Huns might try to drive in this centre, for Attila kept in the midst of his Huns, and set the Ostrogoths and Gepidae on the left, and on his right the lesser German allies. Here was the decision. Aëtius seized the hill; his Alans were forced back, but now he could take the Huns on one flank, while on the other the Visigoths attacked. Thus the victory in this last great battle of western Roman power was won by the tactics which Hannibal had used at Cannae.

The Huns expected another attack, since in the immense slaughter Theodoric had been killed but Aëtius was alive. Attila, within his ring of wagons, prepared for death; but Aëtius feared a camp of desperate men whose strength was in their archery. Nor was he willing to secure in Gaul a Visigothic predominance against which the Huns might yet be his allies. He persuaded Thorismund to hasten to Toulouse, lest his brothers should take his inheritance. Attila escaped to ravage Italy in 452, and to die, or be murdered in a drunken sleep in 453. Was this battle of the "Mauriac place," one of the world's decisive battles? The Huns showed nothing of the fruitfulness of the Germanic peoples who came within the Empire, and their power could scarcely have survived for long the death of a king who was as rare as a Saladin among the Kurds. A son of Attila and Honoria might have been another Aëtius, if Attila's other sons had not put him to death; but the coming of the Huns was only an episode before the greater confusion of the dark ages, before the victory of Charles Martel, and the splendour and dominion of Charlemagne. (E. L. W.)

CHÂLON-SUR-SAÔNE, an industrial town of east-central France, capital of an *arrondissement* in the department of Saône-et-Loire, 81 m. N. of Lyons by the P.L.M. railway. Pop. (1926) 28,404. It is a well-built town, with fine quays, situated on the right bank of the Saône at its junction with the Canal du Centre. A 15th century bridge with 18th century obelisks, leads to the suburb of St. Laurent on an island in the river. Châlon-sur-Saône is identified with the ancient *Cabillonum*, an important town of the Aedui. It was chosen in the 6th century by Gontram, king of Burgundy, as his capital. The bishopric, founded in the 4th century, was suppressed at the Revolution. In feudal times Châlon was the capital of a countship. In 1237 it was given in exchange for other fiefs in the Jura by Jean le Sage, whose descendants nevertheless retained the title. Hugh IV., duke of Burgundy, the other party to the exchange, gave the citizens a communal charter in 1256. The town resisted a division of the Austrian army in 1814.

The church of St. Vincent, once the cathedral, dates mainly from the 12th to the 15th centuries, and has a choir in the 13th century Burgundian style. The old bishop's palace dates from the 15th century. The church of St. Pierre, with two lofty steeples, is late 17th century. Châlon preserves remains of its ancient ramparts and a number of old houses. It is the seat of a sub-prefect and a court of assizes, and has tribunals of first instance and commerce and a chamber of commerce. Châlon ranks next to Le Creusot among the manufacturing towns of Burgundy. Its position at the junction of the Canal du Centre and the Saône, and as a railway centre for Lyons, Paris, Dôle, Lons-le-Saunier and Roanne, brings it a large transit trade. The founding and working of copper and iron are its main industries; the large engineering works of Petite-Creusot, a branch of those of Le Creusot, construct bridges, tug-boats etc., and there are chemical works, straw-hat factories, oil-works and tile-works. It is a busy corn-market and trades widely in wine, grain and timber.

CHALUKYA, the name of an Indian dynasty which ruled in the Deccan from A.D. 550 to 750, and again from 973 to 1190. The Chalukyas claimed to be Rajputs from the north. The dynasty was founded by a chief named Pulakesin I., who mastered the town of Vatapi (now Badami, in the Bijapur district) about

550. His sons extended their principality east and west; but the founder of the Chalukya greatness was his grandson Pulakesin II., who succeeded in 608 and (609), established as his viceroy in Vengi his brother Kubja Vishnuvardhana, who in 615 declared his independence and established the dynasty of Eastern Chalukyas, which lasted till 1070. In 620 Pulakesin defeated Harsha (q.v.), the powerful overlord of northern India, and established the Nerbudda as the boundary between the South and North. He also defeated in turn the Chola, Pandya and Kerala kings, and by 630 was beyond dispute the most powerful sovereign in the Deccan. In 655 the Chalukya power was restored by Pulakesin's son Vikramaditya I.; but the struggle with the Pallavas continued until, in 740, Vikramaditya II. destroyed the Pallava capital. In 750 Vikramaditya's son, Kirtivarman Chalukya, was overthrown by the Rashtrakutas.

In 973, Taila or Tailapa II. (d. 995), a scion of the royal Chalukya race, succeeded in overthrowing the Rashtrakuta king Kakka II. He was the founder of the dynasty known as the Chalukyas of Kalyani. About A.D. 1000 a formidable invasion by the Chola king Rajaraja the Great was defeated, and in 1052 Somesvara I., or Ahamavalla (d. 1068), the founder of Kalyani, defeated and slew the Chola Rajadhiraja. The reign of Vikramaditya VI., or Vikramanka, which lasted from 1076 to 1126, formed another period of Chalukya greatness. In 1156 the commander-in-chief Bijjala (or Vijjana) Kalachurya revolted, and he and his sons held the kingdom till 1183. In this year Somesvara IV. Chalukya recovered part of his patrimony, only to succumb, about 1190, to the Yadavas of Devagiri and the Hoysalas of Dorasamudra. Henceforth the Chalukya rajas ranked only as petty chiefs.

See J. F. Fleet, *Dynasties of the Kanarese Districts*; Prof. R. G. Bhandarker, "Early History of the Deccan," in the *Bombay Gazetteer* (1896), vol. i. part ii.; Vincent A. Smith, *Early Hist. of India* (revised J. M. Edwardes, 1924).

CHALUMEAU is a word having several different musical meanings (from Lat. *calamus*, a reed). Thus it is the name of an obsolete wind instrument, with a single beating reed, of the clarinet type; and also of a later instrument, with a double reed, which developed into the oboe. It is used also for the deepest notes of the clarinet and further, in its German form of Schalmey or Schalmey, for the chanter of the bag-pipe and for an old kind of organ stop of chalumeau-like quality.

CHALYBÄUS, HEINRICH MORITZ (1796-1862), German philosopher, was born at Pfaffroda in Saxony. He lectured at Dresden on the history of German philosophy, and in 1839 became professor in Kiel university. His first published work *Historische Entwicklung der spekulativen Philosophie von Kant bis Hegel* (1837, Eng. tr. 1854), still ranks among the best expositions of 19th century German thought. His chief works are *Entwurf eines Systems der Wissenschaftslehre* (Kiel, 1846) and *System der spekulativen Ethik* (1850).

See Überweg, *Grundriss der Gesch. der Philosophie*, Bd. iv. (1923).

CHALYBITE: see **SIDERITE**.

CHAM, a Muslim tribe of Indo-China, rather dark skinned with Oceanic affinities (see **ASIA**), practising circumcision but with strong traces of Hinduism, phallic worship and animism surviving in their beliefs and customs. Thus they believe in a plurality of souls, eighteen of which are mortal, attached to each individual, and associate the departure of the soul at death with the flight of a bird. They bury their dead close to their best rice fields, and have a series of ceremonies depending on the operations of the agricultural year; the reaping of the rice crop must be initiated by a woman. In the family the matrilineal system is still followed. Children are given opprobrious names, probably to obviate the malice of the spirits. Speech is tabu when collecting the valuable "eagle wood" (*aquilaria agallocha*), and invulnerability is procured by anointing the body with human bile. The Cham are fond of regattas and boat races, and play chess using canoes instead of bishops. The language of the tribe is connected with Cambodian and with Oceanic tongues and, like the dolichocephaly of its speakers, and their customs, suggests an Indonesian basis for the tribe.

See Baudesson, *Indo-China and its Primitive People* (1919); Leuba, *Les Chams et leur Art* (1923)

CHAMBA, an Indian State in the Punjab, amid the Himalayas, on the south border of Kashmir. Area, 3,216sq. miles. Pop. (1921), 141,867. Revenue, £60,000. The sanatorium of Dalhousie, though within the State, is attached to the district of Gurdaspur. Chamba is entirely mountainous; in the east, north and centre are snowy ranges. The chief rivers are the Chandra and Ravi. The principal crops are rice, maize and millet. Mineral ores are known but unworked. Trade is chiefly in forest produce. The capital of the State is Chamba (pop., 5,668) picturesquely situated above the Ravi gorge. Founded in the 6th century, sometimes nominally subject to Kashmir and afterwards tributary to the Mogul empire, it was always practically autonomous. Its chronicles are preserved in inscriptions, mostly engraved on copper. It first came under British influence in 1846, when it was declared independent of Kashmir.

CHAMBAL: see JUMNA.

CHAMBER, THE KING'S, the *camera regis*, was, in the later middle ages, an important financial office. In origin it was the king's bedroom, with cupboards and chests for clothes and valuables. The servants in charge of this room, the king's chamberlains as they were called (see **CHAMBERLAIN**), were in such close touch with the king that they were often consulted and employed by him on matters not strictly within their province. Thus, the king's chamber was, from the beginning, something more than mere sleeping-quarters. It was an office where the king attended to private and public business alike, the greater part of which related to finance, and a storehouse for jewels, money and archives. From it, the first department to grow up within the royal household (*q.v.*), there sprang many mediaeval and modern ministries of State. Not only in England but throughout western Europe kings and magnates had their chamber, the *chambre des comptes* of the kings of France and the *camera apostolica* of the Popes being cases in point.

In England the reconstruction following on the Norman Conquest provided the monarchy with a regular income from taxation, the collection and administration of which threw upon the chamber so much extra work that it became concerned primarily with finance. A hierarchy of clerical and lay officials came into being to assist the original staff. But, whereas in Europe generally, for example in the papacy and in France, the *camera curiae*, the chamber of the court, was the sole treasury of the State, in England by the 12th century, the king's chamber had developed a branch to deal with the finances of the kingdom as opposed to the more personal finances of the king. This was the exchequer (*q.v.*), the first department of the household to become a public office. It soon superseded the chamber, which then found itself once more a simple domestic and court office, although certain moneys continued to be paid to it rather than to the exchequer. The activities of the chamber were curtailed still further in the 13th century by the growth of a second off-shoot, the king's wardrobe (see **WARDROBE**), by which it was ultimately replaced as the chief financial and administrative office of the household. Yet the chamber persisted, responsible to the king alone and overlapping the jurisdiction of both exchequer and wardrobe. Though its former power had been whittled down to authority over only the intimate financial needs of the king, there were several attempts to give it a foremost position in administration. Some of them, especially those of Edward II., Edward III. and Henry VII., achieved considerable success.

Faced by a hostile baronage which sometimes dominated the chief public offices and interfered in the government of the royal household, Edward II. turned to the chamber to secure independence of aristocracy, parliament and exchequer. To finance it adequately he allotted to it the management and income of certain lands which fell into his hands. The forfeited estates of the Templars (*q.v.*) were the first large block of lands to be brought under the authority of the chamber (1309). In 1322 the confiscation of the possessions of certain rebellious magnates, known as the "contrarians," put into Edward's power many more lands, which were soon reserved to the chamber, although only for a few

months. The chamber staff was increased to discharge the duties involved in the care of an estate, and the secret seal fostered by Edward II. in opposition to the privy seal (see **SMALL SEALS**), which the barons strove to control, was entrusted to it. In the schemes of the younger Hugh Despenser, made king's chamberlain in 1322, the chamber played a leading part, but its progress was checked by Edward II.'s deposition, and its lands transferred to the exchequer.

In 1332 Edward III. revived the chamber on the lines indicated by Despenser, and gradually placed a large number of lands at its disposal. A special seal, the griffin (see **SMALL SEALS**), was set up for their service and the regular staff was again augmented. Edward III.'s need, however, differed from that of his father. Instead of an alienated baronage to contend with, Edward III. had a foreign enemy, France, against whom all parties were united. Consequently he had less inducement to cultivate the chamber for purely prerogative purposes. His chamber seems to have met little unfriendly criticism, and, in the first phase of the Hundred Years' War, had a fair opportunity of proving its worth. During the early campaigns, its chief officers took a conspicuous share in administration at home as well as with the armies abroad. But the estate upon which it largely relied disappointed expectations, most of the proceeds being swallowed up by the costs of its administration. Without considerable funds the chamber was crippled. In 1355-56, therefore, the estate was given up, and for it an annual sum of 10,000 marks (£6,666. 13s. 4d.) payable by the exchequer, was substituted. This, the *certum* (fixed amount), was supplemented, as before the estate revenue had been, by casual receipts from the exchequer and elsewhere. Although the chamber was still answerable only to the king, its utility as an instrument of prerogative was diminished by this close dependence upon the exchequer. A further limitation was its total lack of skilfully devised, well-trying machinery to enforce its authority, for the griffin seal and the organization set up to administer the lands disappeared along with the estate. If, for the rest of Edward III.'s reign, the chamber occupied a recognized, amply endowed place in the administration, it was definitely subordinated to the exchequer. It was the royal privy purse, and a means whereby the king's will could be communicated to other departments, but little more.

On the accession of Richard II., a child with few personal expenses, the king's chamber suffered a natural relapse. When, in 1380, it was restored to something of its old dignity, the policy of 1355-56 was adopted, and a yearly allowance was granted to it, first from the customs, then, two years later, from the exchequer. On this *certum*, at most not more than two-thirds of that enjoyed under Edward III., the chamber was mainly dependent to the end of the 14th century, though in some years large casual payments were received. Such an office was valueless to a despotically minded king, and Richard II. seems never to have thought of making it a chief instrument of his prerogative. Yet chamber officials figured prominently among his confidants, and it was in his reign that the office of king's secretary (see **SECRETARY OF STATE**) assumed definite shape, the final result being the withdrawal from the chamber of the secretary and his seal, the signet (see **SMALL SEALS**), the successor to the secret seal.

Of chamber history in the greater part of the 15th century little is known, but the office lived on. Then, in the restoration of financial stability after the Wars of the Roses (*q.v.*), Henry VII. advanced it to a position of supreme importance. Although he began to put the exchequer into working order, he wanted some less rigid, less elaborate machinery to supply him at once with the steady income necessary to strengthen Government and throne. Like Edward II. and Edward III. he had recourse to the chamber as the most suitable instrument and one that was, besides, entirely in his control. Forfeited estates and Crown lands were once again reserved to it, and other moneys were paid to it instead of to the exchequer. A new staff grew up, and to the daily labours of the regenerated office the king gave constant oversight. Unlike the Edwards, Henry was able to make the chamber effective, for, although he too diverted to the chamber revenues ordinarily paid and accounted for to the exchequer, and imposed

upon it functions technically belonging to the exchequer, the exchequer's extreme weakness, due to civil war, prevented remonstrance from that quarter.

Soon after the death of Henry VII., however, the exchequer, grown stronger, tried to insist that issues formerly paid to it, and accounts customarily rendered to it for audit, should still follow those rules, and not go to the chamber. In reply to this claim Henry VIII. induced parliament to recognize his father's system. Thus the chamber, already possessing wider influence than in the 14th century, seemed well on the way to recapturing its original position in the State. But Henry VIII., hard-working as he was, attended less to the routine of government than Henry VII., and the exchequer slowly deprived the chamber of all its newly given power. When the exchequer had recovered from the effects of the Wars of the Roses, not even Henry VIII. himself could maintain for the chamber the supremacy won under the guidance of Henry VII. Yet it was not until Mary's reign that the exchequer regained its traditional status, and then it was an exchequer changed at heart. Although many of the old forms were kept, with them were incorporated some of the more efficient methods of the chamber. Dependent upon the sovereign for existence, from the end of the 13th century the chamber's rise and fall was chiefly determined by the weakness or strength of the exchequer. By taking over the best the chamber had to offer, the exchequer rendered it harmless for all time. There was no subsequent attempt to revive the administrative work of that department, and only a memory of past glory is preserved in the office of the modern lord chamberlain (*q.v.*).

(1917); T. F. Tout, *Chapters in the Administrative History of Mediaeval England* (vols. i.-ii., 1920, vols. iii.-iv., 1928, vol. v. in preparation).

(D. M. B.)

CHAMBERLAIN, ARTHUR NEVILLE (1869–), British politician, was born March 18, 1869, the son of Joseph Chamberlain by his second wife. Educated at Rugby and Mason college, Birmingham, his father sent him out at an early age to manage an estate in the Bahamas, but returning to his native city he won success in business as a manufacturer. In 1911 he entered the Birmingham city council, became chairman of its town-planning committee and was lord mayor in 1915–16. During his mayoralty the Birmingham municipal bank, the only institution of its kind in England, was established and he then began to acquire his mastery of the housing question. During the early part of the World War he was an active member of the central board of control of the liquor traffic under the Munitions Act, and in Dec. 1916 was appointed by D. Lloyd George director of national service. His schemes for co-ordinating military and civil employment met with much opposition, and in 1917 he resigned. At the general election of the following year he entered parliament as member for the Ladywood division of Birmingham, was postmaster-general from Oct. 1922 to March 1923, and minister of health in 1923. In the latter capacity he was responsible for the Housing and Rent Restriction Acts of 1923. He was appointed chancellor of the exchequer by Stanley Baldwin in Aug. 1923, but the Government fell before he could present a budget. On the formation of the second Baldwin Administration in 1924 he might have gone again to the exchequer had he so desired, but preferred the ministry of health with its opportunities for the work he had at heart—social improvement. In this office he carried through simultaneously in 1926 a technical and complicated measure, the Rating and Valuation Act; also the great extension of the Pensions Acts to widows and orphans. During his tenure of office he had to deal with some very difficult questions of local government, especially the heavy local costs of poor relief. On the purely health side of the work of the department the most important work accomplished was the bringing into force of the Milk and Dairies Order, and of the regulations with regard to preservatives in food. But Neville Chamberlain's best work resulted from the driving power he threw into house-building to meet the post-war need, and was specially evident in his introduction of his great scheme for the reform of local government and of local taxation

in the autumn session of 1928. His ability as an administrator was outstanding; and the House of Commons acknowledged his cool skill in debate.

CHAMBERLAIN, SIR (JOSEPH) AUSTEN (1863–), the eldest son of Joseph Chamberlain (*q.v.*) and of his first wife, Harriet Kenrick, was born at Birmingham on Oct. 16, 1863. He was educated at Rugby and Trinity College, Cambridge, and afterwards studied in Paris and Berlin. During the early stages of the Home Rule controversy he acted as his father's private secretary, and in 1892 was returned unopposed as M.P. for East Worcestershire. This seat he held until 1914, when, on his father's death, he succeeded him as a member for West Birmingham. "I was born in Birmingham," he said when he was given the freedom of that city in 1926. "I was bred in Birmingham; Birmingham is in my blood and in my bones, and wherever I go and whatever I am, I shall remain a Birmingham man."

His maiden speech drew from Gladstone the famous compliment, uttered in his father's presence, that it was one which must have been "dear and refreshing to a father's heart." After a short apprenticeship as a private member, he was a civil lord of the Admiralty (1895–1900), financial secretary to the Treasury (1900–2) and postmaster-general (1902). This rapid promotion was not due merely to the towering influence of his father, during the days of his great colonial secretaryship. Though the son's powers were of a solid rather than of a showy order, his administrative ability and his cogency in debate steadily developed with opportunity. His command of clear statement was exceptional; and he could be unexpectedly formidable in defence. In 1903 he was promoted to the chancellorship of the Exchequer. He ardently espoused his father's fiscal policy of tariff reform, nor did he slacken in its advocacy when Joseph Chamberlain left the Balfour administration in order to prosecute, with less embarrassment to the prime minister, his unofficial campaign. Unfriendly critics suggested at the time that the son's promotion to the second post in the Government was made in the hope of continuing his father's activities within reasonable bounds and preventing the threatened rupture in the party. This is not an adequate view. The father outside the Cabinet, like the son inside it, wished not to rupture their party but to convert it as a whole to the new doctrine of closer Imperial economic union and tariff-defence at home against foreign protection. Austen Chamberlain remained at the exchequer till the Unionist *débâcle* at the polls in 1906 and there acquired the reputation of being a departmentalist of the best Victorian type—safe, cautious, hard-working, and signally loyal to his associates. This loyalty was unflinching and more than once self-sacrificial.

During the long Liberal domination from 1906 to the World War Austen Chamberlain consolidated his position as a Unionist leader and gained the high esteem of all parties. He suffered, however, a great disappointment when Balfour, faced by the discontent and revolt of the rank and file, resigned his leadership of the Unionist party in 1911. Austen Chamberlain's claims to the succession were well supported. But a slightly stronger section favoured the claims of Walter Long, and as neither would yield to the other, both honourably agreed to the election of Bonar Law.

When the first Coalition Government was formed, in 1915, Austen Chamberlain entered Asquith's Cabinet as secretary of state for India, and held this post until 1917, when he resigned in consequence of the Government's decision to submit to a judicial investigation the charges and criticisms embodied in the report of the Mesopotamia commission. In his view the public interest and his personal honour alike required his resignation, though not one of the charges referred to him. The official responsibilities for the "horrible break-down" of the hospital arrangements during the first advance on Baghdad were incurred without his personal knowledge. His insistence on resignation was over-scrupulous, but showed that his views of what principle and loyalty demand were stricter than the normal. He did not long remain out of office. In April 1918 he became a member of the War Cabinet and after the Armistice returned to the chancellorship of the Exchequer in succession to Bonar Law. His guiding principle during the next two years was to strengthen British credit and pay off debt,

and to that end he called upon the taxpayer to make unprecedentedly heavy sacrifices, especially in respect of income tax, super-tax and excess profits duty. At the Treasury in a very British way he preserved an iron tradition of fiscal integrity.

In 1921 Bonar Law's failing health caused his withdrawal from active politics. Austen Chamberlain stepped into the vacant leadership of the House of Commons amid general acclamation. The post carried with it the virtual promise of the leadership of the Conservative party, ten years after the frustration of that chance in 1911. But the restraints and compromises of coalition had already begun to be irksome to many Conservatives, who distrusted the direction in which the Liberal prime minister of the Coalition was leading them. Austen Chamberlain, as lord privy seal and leader of the House, found that his staunch loyalty to his chief was bringing him into disfavour with many of the Conservative rank and file. The complaint was that he did not stand up to Lloyd George with sufficient firmness and that he sacrificed too many Conservative principles. This feeling was sharply intensified when Austen Chamberlain took a leading part at the end of 1921 in the startling settlement with Sinn Féin and the establishment of the Irish Free State. He pleaded boldly and eloquently for this "act of faith." He had been, indeed, the first to suggest to the prime minister that a choice had to be made between negotiations with the rebels and a thorough reconquest of Ireland.

Most of the Conservative party accepted the treaty with reluctance and with forebodings. Party confidence in Austen Chamberlain was further weakened by his steady refusal to listen to suggestions that fidelity to Conservative principles required him to lead his party out of Coalition bondage into party independence and freedom. His view, shared by his principal Conservative colleagues in the Lloyd George administration, was that Coalition was still necessary to deal with the difficult problems of the post-War period and not less to obviate the dangers of a socialist government, which, without co-operation between the two older parties, could not in their view long be averted. When, therefore, the discontented Conservative Diehards carried their revolt to success, and at the Carlton Club meeting on Oct. 19, 1922, offered the leadership to Bonar Law—who accepted it—Austen Chamberlain once more saw the ruin of his highest chances in politics. He and those of his colleagues who shared his views and quitted office with Lloyd George, naturally had no place in Bonar Law's Cabinet. He remained a private member during Baldwin's first administration and during the short period of the succeeding Labour Government. The dissensions in the Conservative party were gradually healed. When Baldwin formed his second administration, at the end of 1924, the post of foreign secretary was accepted by Austen Chamberlain.

Then began a new stage of his career. Thirteen days after he entered on his duties at the Foreign Office (*i.e.*, on Nov. 20, 1924) Sir Lee Stack, governor general of the Sudan and Sirdar of the Egyptian army, was murdered in Cairo. The resultant situation was handled by Austen Chamberlain with a promptness and firmness that prevented further trouble, and at once established his own prestige as foreign secretary. Without delay he applied himself, at the beginning of 1925, to the remarkable diplomacy which produced the Locarno treaties. That diplomacy was pursued throughout the year, and it was mainly due to his moral earnestness and determination (for the sceptics abounded) that the treaties were initialled at Locarno on Oct. 16, 1925, Austen Chamberlain's birthday. For the nature of those treaties *see* article LOCARNO. For the part he had played in this big step towards post-War reconciliation in Europe, Austen Chamberlain received the Garter on Nov. 30, 1925. He increased the general pacific tendency in Europe by making the League of Nations a first consideration of his policy, himself attending all the meetings of the Council and Assembly. Germany's entry into the League in September 1926 was an event for which he personally was entitled to much credit. In 1927 his policy in the Chinese crisis was both conciliatory and strong. A military force was sent out to safeguard against possible attack and anarchy the great commercial community of Shanghai, but Great Britain also was the first in the

field with proposals for large and increasing concessions to Chinese nationalism.

In May 1927 he reluctantly broke off relations with Russia after the Arcos raid, when it became clear that Bolshevism was violating normal diplomatic rules both in China and Britain. In the summer he initiated discussions with Sarwat Pasha for an Anglo-Egyptian treaty of alliance. A nine months' effort was thwarted early in 1928 by Cairo's repudiation of Sarwat and the emergence of Nahas Pasha as his successor. The failure of the three-Power naval conference at Geneva in July was not directly his responsibility. During the winter of 1927-28 and up to the summer of 1928 his general policy was concerned with a consideration of Kellogg's proposal for a Peace Pact, which he supported with some reserves as to interpretation, though wholly endorsing its principle. The Pact was duly signed in August. In the autumn of 1928 illness forced him to take a long sea voyage through the Panama Canal to California and thence through Canada homewards. His health had been rapidly restored, but in his absence the Foreign Office was widely attacked for its effort—wrapped in needless mystery—to concert with France joint suggestions to America on the subject of naval limitation. Public criticism made an end of this method, for which the Admiralty and the Cabinet generally were more responsible than the Foreign Office alone.

CHAMBERLAIN, HUSTON STEWART (1855-1926), German writer, was born at Portsmouth on Sept. 9, 1855, the son of a British admiral. He was educated in Geneva, and at Dresden, where he studied music, aesthetics, and philosophy. In 1908 he settled in Bayreuth, where he became a devotee of Wagner. He began to write on aesthetic and historical subjects, but the book which made him famous was *Die Grundlagen des neunzehnten Jahrhunderts* (1890-91) which went through numerous editions in Germany and was translated into English as *Foundations of the 19th Century* (2 vols.). The book was in praise of German institutions and was strongly anti-British in tone; it provoked much controversy as being written in German by an Englishman. In 1916 Chamberlain who supported his adopted country during the World War became a naturalized German. He died on Jan. 9, 1926. Chamberlain's second wife was Eva Wagner, a daughter of the composer.

CHAMBERLAIN, JOSEPH (1836-1914), British statesman, third son of Joseph Chamberlain, master of the Cordwainers' Company, was born at Camberwell Grove, London, on July 8, 1836. His father carried on the family business of boot and shoe manufacture, and was a Unitarian in religion and a Liberal in politics. Young Joseph Chamberlain was educated at Canonbury (1845-50), and at University college school, London (1850-52). After two years in his father's office in London, he was sent to Birmingham to represent his father's interest in the firm of Nettlefold, screw manufacturers. Nettlefold and Chamberlain employed new inventions and new methods of attracting customers. After years of success Chamberlain himself, with daring but sure ability amalgamated rival firms so as to reduce competition. In 1874 he was able to retire with an ample fortune. Taking a more and more important part in the municipal and political life of Birmingham, in 1868 when the Birmingham Liberal Association was reorganized, he became one of its leading members. In 1869 he was elected chairman of the executive council of the new National Education League. He took an active part in education, started classes for his workmen, and himself taught history, French and arithmetic in a Unitarian Sunday school. In 1869 he was elected a member of the town council, and married his second wife—a cousin of his first—Miss Florence Kenrick (d. 1875).

In 1870 he was elected a member of the first school board for Birmingham; and for the next six years, and especially after 1873, when he became leader of a majority and chairman, he actively championed the Nonconformist opposition to denominationalism. He was then regarded as a republican—the term signifying rather that he held advanced Radical opinions, which were construed by average men in the light of the current political

developments in France, than that he really favoured republican institutions for Britain. His programme was "free Church, free land, free schools, free labour." At the general election of 1874 he stood as a parliamentary candidate for Sheffield, but without success. Between 1869 and 1873 he worked in the Birmingham town council for the realization of the projects of municipal reform preached by Dawson, Dr. Dale and Bunce (of the "Birmingham Post"). In 1873 his party obtained a majority, and he was elected mayor, an office he retained by re-election until June 1876. As mayor he had to receive the prince and princess of Wales on their visit in June 1874, an occasion which excited some curiosity because of his reputation as a republican; but the behaviour of the Radical mayor satisfied the requirements alike of *The Times* and of *Punch*.

Birmingham.—The period of his mayoralty was important for Birmingham itself, and the stupendous energy which Chamberlain brought to bear on evil conditions in Birmingham had repercussions in every municipality in the country. The conference of local sanitary authorities summoned by him in 1874 and held in Jan. 1875 was the beginning of the modern movement for better and healthier organization of town life. In Birmingham he carried through the municipalization of the supply of gas and water, and the improvement scheme by which slums were cleared away and 40 acres laid out in new streets and open spaces. New municipal buildings were erected, Highgate park was opened for recreation, and the free library and art gallery were developed. The prosperity of modern Birmingham dates from 1875 and 1876, when these admirably administered reforms were initiated, and by his share in them Chamberlain became not only one of its most popular citizens but also a man of mark outside. An orator of a practical but consummate type, cool and hard-hitting, his spare figure, incisive features and single eye-glass soon made him a favourite subject for the caricaturist; and in later life his aggressiveness made his actions and speeches the object of more controversy than was the lot of any other politician of his time. In private life his loyalty to his friends, and his "genius for friendship" (as John Morley said) made a curious contrast to his capacity for arousing the bitterest political hostility. It may be added here that the interest taken by him in Birmingham remained undiminished during his life, and he was the founder of Birmingham university (1900), of which he became chancellor.

In 1876 Dixon resigned his seat in parliament, and Chamberlain was returned for Birmingham in his place unopposed, as John Bright's colleague. He made his maiden speech in the House of Commons on Aug. 4, 1876, on Lord Sandon's education bill. At this period, too, he paid much attention to the question of licensing reform, and in 1876 he examined the Gothenburg system in Sweden, and advocated a solution of the problem in England on similar lines. During 1877 the new federation of Liberal associations, which became known as the "Caucus," was started under Chamberlain's influence in Birmingham, the results of which were clearly shown in the general election of 1880.

After the general election of 1880 the Liberal party numbered 349 against 243 Conservatives and 60 Irish Nationalists. Gladstone was compelled to recognize the services of the Radicals in the election by the inclusion of Dilke and Chamberlain, who were sworn allies, in the new ministry. They had resolved together that one of them must be in the cabinet. The prime minister had not contemplated the admission of either, and was determined not to have both. Chamberlain, willing to give the preference to Dilke, was himself chosen as president of the Board of Trade. Dilke became under-secretary for foreign affairs but, at the end of 1882, he too entered the cabinet as president of the Local Government Board, and the alliance between the two rising ministers was more powerful than ever. The position of the Radicals in the 1880-85 Government was extremely difficult. Gladstone naturally turned rather to his old friends, Granville and Spencer, and had little personal sympathy with the new men. Dilke and Chamberlain stood for more far-reaching social reforms at home than their elder colleagues, and on foreign affairs there were many difficulties. In Egypt Chamberlain demanded more vigorous measures after the massacre at Alexandria (1882), yet insisted

that the Government must not be tied to the bondholders' interest, but must give legitimate effect to Egyptian nationalist aspirations. Again in Feb. 1884 he would have given instructions to Baring to arrange for the relief of the Sudan garrisons, but no steps were taken, and, when at last a much more elaborate expedition than that at first urged by Chamberlain was sent, it was too late to avoid the tragedy of Gordon.

Irish Policy.—But the deepest fissure was on Irish policy. Chamberlain hated coercion, and held a positive view of Irish affairs. He made a personal effort in 1882 to heal the Irish sore. On the understanding that he would be disavowed if he failed, he was authorized to negotiate with Parnell and succeeded. The result was the "Kilmainham treaty." Parnell, on May 2, 1882, was released from Kilmainham gaol, having agreed to advise the cessation of outrages and the payment of rent, while Gladstone's ministry was to relax its coercive administration. Thereupon, W. E. Forster, the Irish secretary, resigned. His successor, the blameless Lord Frederick Cavendish, was immediately murdered in Phoenix park. This tragedy darkened the whole aspect of Irish affairs. Chamberlain, conspicuously marked out for the post of danger, was prepared to face the risk, but was not appointed. He refused to allow the tragedy to divert him from a definitely remedial policy. Eventually in 1885, after indirect negotiation through Capt. O'Shea with Parnell, he placed before the cabinet a scheme for Irish government on lines of semi-Home Rule without weakening, however, the imperial connection. A "central council," or national elective board was to be set up in Dublin, and Parnell was to forego obstruction to a bill which would reduce coercion to a minimum. The Irish bishops were thought to favour the plan. When these proposals for devolution came before the cabinet (May 9) all the peers, except Granville, voted against them; of the commoners only Hartington opposed them. Proposals for a Coercion bill and a land purchase bill were then put forward. Dilke and Chamberlain resigned, the latter being definitely opposed to land purchase unaccompanied by local autonomy. But the resignations did not take effect before the Government was defeated on the budget (June 8).

Both before and after the defeat Chamberlain associated himself with what was known as the "unauthorized programme," i.e., free education, small holdings for agricultural labourers, graduated taxation and local government. In June 1885 he made a speech at Birmingham, treating the reforms just mentioned as the "ransom" that property must pay to society for the security it enjoys. In October Chamberlain defined his ideas to Gladstone. They were that local authorities must have the right of appropriation for public purposes, that a radical readjustment of taxation was necessary, and that ministers must be free to advocate free education, even if some of their colleagues opposed it. At the general election of Nov. 1885 Chamberlain was returned for West Birmingham. The Liberal strength in the nation generally was, however, reduced to 335 members, though the Radical section held their own; and the Irish vote became necessary to Gladstone if he was to command a majority. Chamberlain still had an open mind on the Irish question. He foresaw that between Home Rule and separation there was but a step, and in a letter written on Dec. 26 he went so far as to discuss a federalist scheme for the British Isles with five separate parliaments. In December it was stated that Gladstone intended to propose Home Rule for Ireland, and when the new parliament met in Jan. 1886 Lord Salisbury's ministry was defeated on the address, on an amendment moved by Chamberlain's Birmingham henchman, Jesse Collings, embodying the "three acres and a cow" of the Radical programme. Lord Hartington (afterwards duke of Devonshire) and some other Liberals, declined to join Gladstone in view of the altered attitude he was adopting towards Ireland. But Chamberlain—stipulating for liberty of judgment on the prime minister's Irish policy when embodied in definite legislative shape—entered the cabinet as president of the Local Government Board (with Jesse Collings as parliamentary secretary). On March 15, 1886, he resigned, explaining in the House of Commons (April 8), that while he had always been in favour of the largest extension of local government to Ireland consistent

with the integrity of the empire and the supremacy of the imperial parliament, and had therefore joined Gladstone when he believed that agreement might be possible, he was unable to recognize that the scheme communicated by Gladstone to his colleagues maintained those conditions. At the same time he was not irreconcilable, and invited Gladstone even then to modify the bill so as to remove the objections of Radical dissentients. This indecisive attitude did not last long, and the split in the party rapidly widened. At Birmingham Chamberlain was supported by the local "Two Thousand," but deserted by the national "Caucus" of the Liberal party and by its organizer, his own former lieutenant, Schnadhorst. In May the Radicals who followed Bright and Chamberlain, and the Whigs who took their cue from Lord Hartington, decided to vote against the second reading of the Home Rule bill, instead of allowing it to be taken and then pressing for modifications in committee, and on June 7 the bill was defeated by 343 to 313, 94 Liberal Unionists—as they were generally called—voting against the Government. Chamberlain was the object of the bitterest attacks from the Gladstonians for his share in this result; and open war was proclaimed by the Home Rulers against the "dissentient Liberals"—the description used by Gladstone. The general election, however, returned to Parliament 316 Conservatives, 78 Liberal Unionists, and only 276 Gladstonians and Nationalists, Birmingham returning seven Unionist members. When the House met in August, it was decided by the Liberal Unionists, under Hartington's leadership, that their policy henceforth was essentially to put in the Tories and to keep Gladstone out. The old Liberal feeling still prevailing among them was too strong, however, for their leaders to take office in a coalition ministry. For them as a whole it was enough to be able to tie down the Conservative Government to such measures as were not offensive to Liberal Unionist principles; but Chamberlain from the first was determined to impose on that Government a progressive policy in British social questions as the price of his indispensable support on the Irish question. It still seemed possible, moreover, that the Gladstonians might be brought to modify their Home Rule proposals, and in Jan. 1887 a Round Table conference, suggested by Chamberlain, was held between him and Sir G. Trevelyan for the Liberal Unionists, with Sir William Harcourt, John Morley and Lord Herschell for the Gladstonians, but no *rapprochement* was effected.

Reform.—The influence of his views upon the domestic legislation of the Government was bringing about a more complete union in the Unionist party, and destroying the old lines of political cleavage. Before 1892 Chamberlain had the satisfaction of seeing Lord Salisbury's ministry pass such important acts, from a progressive standpoint, as those dealing with coal mines regulation, allotments, county councils, housing of the working classes, free education and agricultural holdings, besides Irish legislation like the Ashbourne Act, the Land Act of 1881, and the Light Railways and Congested District acts.

In Oct. 1887, Chamberlain, Sir L. Sackville West and Sir Charles Tupper were selected by the Government as British plenipotentiaries to discuss with the United States the Canadian fisheries dispute, and a treaty was signed by them at Washington on February 15, 1888. The Senate, however, refused to ratify it; but a protocol provided for a *modus vivendi* giving American fishing vessels similar advantages to those contemplated in the treaty. This arrangement, prolonged from year to year, proved to be a real settlement. Chamberlain returned home in March, his already strong feelings of friendliness to the United States much strengthened. This sentiment was reinforced in Nov. 1888, by his marriage with his third wife, Miss Endicott, daughter of the United States secretary of war in President Cleveland's first administration.

At the general election of 1892 Chamberlain was again returned, with an increased majority, for West Birmingham, but the Unionist party as a whole was narrowly defeated; the Irish Nationalist vote again held the balance in the House of Commons and, with a small and precarious majority, Gladstone returned to office, pledged to Home Rule for Ireland. On Feb. 13, 1893, that wonderful veteran, now in his 84th year, introduced

his second Home Rule bill, which was read a third time on Sept. 1. During the 82 days' discussion in the House of Commons Chamberlain was its most acute, ceaseless, unsparing critic, and he moved public opinion outside the House. His chief contribution to the discussions during the later stages of the Gladstone and Rosebery ministries was in connection with Asquith's abortive Employers' Liability bill, when he foreshadowed the broader method of "compensation for accidents," afterwards carried out, in favour of the working classes by the act of 1897. Outside parliament he was busy formulating proposals for old age pensions, which had a prominent place in the Unionist programme of 1895. After his visit to America in 1889 he was developing the imperialist outlook which profoundly modified his future activity.

South Africa.—In 1895 he became secretary of State for the colonies in Lord Salisbury's ministry. His influence in the Unionist cabinet was soon visible in the Workmen's Compensation act and other measures. This act, though in formal charge of the home secretary, was universally and rightly associated with Chamberlain. Another less important "social" measure, which formed part of the Chamberlain programme, was the Small Houses Acquisition Act of 1899; but the problem of old age pensions was less easily solved. This subject had been handed over in 1893 to a royal commission, and further discussed by a select committee in 1899 and a departmental committee in 1900, but both of these threw cold water on the schemes laid before them.

From New Year 1896 (the date of the Jameson Raid) onwards South Africa demanded the chief attention of the colonial secretary (see SOUTH AFRICA, and for details TRANSVAAL). In his negotiations with President Kruger one masterful temperament was pitted against another. Chamberlain had a very difficult part to play in a situation dominated by suspicion on both sides. While he firmly insisted on the rights of Great Britain and of British subjects in the Transvaal, he was the continual object of Radical criticism at home. Attempts were even made to ascribe financial motives to Chamberlain's actions, and the political atmosphere was thick with suspicion and scandal. The report of the Commons committee (July 1897) definitely acquitted both Chamberlain and the Colonial Office of any privity in the Jameson Raid, but Chamberlain's detractors continued to assert the contrary. Opposition hostility reached such a pitch that in 1899 there was hardly an act of the cabinet during the negotiations with President Kruger which was not attributed to the personal malignity and unscrupulousness of the colonial secretary. In fact he gave ample scope to the man on the spot, Sir Alfred (Lord) Milner, whom he had sent out as high commissioner in 1897. The Bloemfontein Conference of 1899 was a serious attempt to secure amicable agreement; but its failure did not deter Chamberlain from making repeated efforts to ensure peace. In the Transvaal the original Boer burghers had become an armed minority, determined at all costs to maintain its racial ascendancy. Since the opening of the gold mines, the unenfranchised outlanders, chiefly British, had become the majority of the adult inhabitants and supplied most of the revenue. Their plight was one of "taxation without representation." Chamberlain offered as part of a general settlement of the franchise and other outstanding questions, to give complete guarantees against any attack on the independence of the republic. But President Kruger's ultimatum demanded, in effect, the military withdrawal and political abdication of Britain in South Africa, and the Boer War began. It lasted for over 2½ years before the two Dutch republics formally surrendered. Throughout this period, Chamberlain was the mainstay of British public opinion when nearly all the world was hostile. The elections of 1900 (when he was again returned, unopposed, for West Birmingham) turned upon the individuality of a single minister more than any since the days of Gladstone's ascendancy, and Chamberlain, never conspicuous for inclination to turn his other cheek to the smiter, was not slow to return the blows with interest.

Apart from South Africa, his most important work at this time was the successful passing of the Australian Commonwealth Act (1900), when both tact and firmness were needed to settle certain differences between the imperial Government and the colonial

delegates.

Chamberlain's tenure of the office of colonial secretary between 1895 and 1900 must always be regarded as a turning-point in the history of the relations between the British colonies and the mother country. In spirit he was an imperial federationist even before his separation from Gladstone. From 1887 onwards he worked for a *rapprochement* of the different parts of the empire for purposes of defence and commerce. In 1895 he struck a new note of constructive statesmanship, basing itself on the economic necessities of a world-wide empire. Not the least of the anxieties of the Colonial Office during this period was the situation in the West Indies, where the cane-sugar industry was being steadily undermined by the European bounties given to exports of Continental beet, and though the Government restricted themselves to attempts at removing the bounties by negotiation and to measures for palliating the worst effects in the West Indies, Chamberlain made no secret of his repudiation of the Cobden club view that retaliation would be contrary to the doctrines of free trade. He set to work to educate public opinion at home into understanding that the responsibilities of the mother country are not merely to be construed according to the selfish interests of a nation of consumers. As regards foreign affairs, Chamberlain more than once (particularly at Birmingham, May 13, 1898, and at Leicester, Nov. 30, 1899) indicated his leanings towards a closer understanding between the British empire, the United States and Germany. The unusually outspoken and pointed expression, however, of his disinclination to submit to Muscovite duplicity or to "pin-pricks" or "unmannerliness" from France was widely criticized. For three years from the spring of 1898 to 1901 he worked strenuously in secret for an Anglo-German alliance. He was convinced that this project was the chief key to the peace of the world. The Kaiser and Bülow hoped rather by keeping free hands to become arbiters of the world.

Boer War.—During the progress of the Boer War from 1899 to 1902, Chamberlain, as colonial secretary, naturally played only a subordinate part during the carrying out of the military operations. But in parliament and on the platform he was more than ever supreme—the chief animating influence of the British empire. He was the hero of the one side, just as he was the bugbear of the other. On Feb. 13, 1902, he was presented with an address in a gold casket by the corporation of the city of London, and entertained at luncheon at the Mansion House, an honour not unconnected with the strong feeling recently aroused by his firm reply (at Birmingham, Jan. 11) to disparaging remarks made by the German chancellor in the Reichstag (Jan. 8). Against offensive allegations abroad Chamberlain had defended the British army in South Africa, and declared its conduct to be as good as that of the Germans in 1870–71. The way in which England's difficulties called forth colonial assistance intensified his imperialism. More and more the problems of empire engrossed him, and a new enthusiasm for imperial projects arose in the Unionist party under his inspiration. No English statesman probably—except Peel—has ever been, at different times in his career, so able an advocate of apparently contradictory policies, and his opponents baited him with quotations from his earlier speeches. He replied in effect that to flinch from adopting new methods and even new opinions in face of totally changed circumstances, is either practical folly or moral cowardice.

The settlement after the war was full of difficulties, financial and others, in South Africa. When Arthur Balfour succeeded Lord Salisbury as prime minister in July 1902, Chamberlain agreed to serve loyally under him, and the friendship between the two leaders was indeed one of the most marked features of the political situation. In Nov. 1902 Chamberlain, bent upon a conciliatory settlement with the Boers, went out to South Africa. He travelled from place to place (Dec. 26–Feb. 25), arranged with the leading Transvaal financiers that in return for support from the British Government in raising a Transvaal loan they would guarantee a large proportion of a Transvaal debt of £30,000,000 which, by so much, should repay the British Treasury the cost of the war, and when he returned in March 1903, satisfaction was general in the country over the success of his mission.

But meantime two things had happened. He desired above all things imperial union. At the Imperial Conference of 1902 the attitude of the overseas premiers had shown that the only way to the beginnings of a closer political union of the whole empire was on lines of mutually preferential commerce, deviating from the strict traditional doctrines of "free trade"—that is of equally free imports for all products, whether of foreign or British—imperial origin. But at home—while he was still in South Africa—some of his colleagues had gone a long way, behind the scenes, to destroy one of the very factors on which the practical scheme for imperial commercial federation seemed to hinge. In the budget of 1902 a duty of a shilling a quarter on imported corn had been reintroduced. This small tax was regarded as only a registration duty. Even by free-trade ministers like Gladstone it had been left up to 1869 untouched, and its removal by Robert Lowe (Lord Sherbrooke) had since then been widely regarded as a piece of economic pedantry. The more advanced imperialists, as well as the more old-fashioned protectionists (like Lord Chaplin) who formed a small but integral part of the Conservative body, had looked forward to this tax being converted into a differential one between foreign and colonial corn, so as to introduce a scheme of colonial preference. The latter principle would be introduced even by a remission of sixpence in favour of grain grown "under the flag" overseas. Ritchie, the chancellor of the exchequer, having a surplus in prospect and taxation to take off, persuaded the cabinet to abolish the corn-duty altogether. Chamberlain himself had proposed only to take it off as regards colonial, but not foreign corn—thus inaugurating a preferential system—and when he left for South Africa he did not imagine that this principle was in danger. But in his absence, a majority of the cabinet supported Ritchie. To those who had hoped so to handle the tax as to make it a lever for a gradual change in the established fiscal system, the total abolition was a bitter blow. At once there began, though not at first openly, a split between the more rigid free-traders—advocates of cheap food and free imports—and those who desired to use the opportunities of a tariff, of however moderate a kind, for attaining national and imperial and not merely revenue advantages. This idea had for some time been forming in Chamberlain's mind, and now took full possession of it. For the moment he remained in the cabinet, but the seed of dissension was sown. The first public intimation of his views was given in an epoch-marking speech to his constituents at Birmingham (May 15, 1903), when he outlined a plan for raising more money by a rearranged tariff, partly to obtain a preferential system for the empire and partly to produce funds for social reform at home. On May 28 in the House of Commons he spoke on the same subject, and declared "if you are to give a preference to the colonies, you must put a tax on food." Putting the necessity of food-taxes in the forefront was injudicious; but imperialist conviction and enthusiasm were more conspicuous than electioneering prudence in the launching of Chamberlain's new scheme. His courage was heroic; his tactics fell short of the old unfailing mastery of manœuvre.

Tariff Reform.—Chamberlain argued that since 1870 certain other countries (Germany and the United States), with protective tariffs, had increased their trade in much larger proportion, while English trade had been chiefly maintained by the increased business done with British colonies. A scientific enquiry into the facts was needed. For a time the demand merely for enquiry, and the production of figures, gave no sufficient occasion for dissension among Unionists, even when, like Sir M. Hicks Beach, they were convinced free-importers on purely economic as well as political grounds. Balfour, as premier, managed to hold his colleagues and party together by taking the line that particular opinions on economic subjects should not be made a test of party loyalty. The Tariff Reform League was founded in order to further Chamberlain's policy, holding its inaugural meeting on July 21; and it began to take an active part in issuing leaflets and in work at by-elections.

Meanwhile, the death of Lord Salisbury (Aug. 22) removed a weighty figure from the councils of the Unionist party. The cabinet met several times at the beginning of September, and the

question of their attitude towards the fiscal problem became acute. The public had its first intimation of impending events in the appearance on Sept. 16 of Balfour's *Economic Notes on Insular Free Trade*, which had been previously circulated as a cabinet memorandum. The next day appeared the Board of Trade Fiscal Blue-Book, and on the 18th conflicting resignations were announced—not only of the more rigid free-traders in the cabinet, Ritchie and Lord George Hamilton, but also of Chamberlain himself for the opposite reason. His exit from the British Government after eight years of office was an event discussed with interest throughout the world.

Letters in cordial terms were published, which had passed between Chamberlain (Sept. 9) and Balfour (Sept. 16). Chamberlain pointed out that he was committed to a preferential scheme involving new duties on food, and could not remain in the Government without prejudice while it was excluded from the party programme; remaining loyal to Balfour and his general objects, he could best promote this course from outside, and he suggested that the Government might confine its policy to the "assertion of our freedom in the caste of all commercial relations with foreign countries." Balfour, while reluctantly admitting the necessity of Chamberlain's taking a freer hand, expressed his agreement in the desirability of a closer fiscal union with the colonies, but questioned the immediate practicability of any scheme; he was willing to adopt fiscal reform so far as it covered retaliatory duties, but thought that the exclusion of taxation of food from the party programme was in existing circumstances necessary, so long as public opinion was not ripe.

The tariff reform movement itself was now outside the purely official programme, and Chamberlain (backed by a majority of the Unionist members) threw himself with impetuous ardour into a crusade on its behalf, while at the same time supporting Balfour in parliament, and leaving it to him to decide as to the policy of going to the country when the time should be ripe. On Oct. 6 he opened his campaign with a speech at Glasgow. Analysing the trade statistics as between 1872 and 1902, he insisted that British progress involved a relative decline compared with that of protectionist foreign countries like Germany and the United States; Great Britain exported less and less of manufactured goods, and imported more and more; the exports to foreign countries had decreased, and it was only the increased exports to the colonies that maintained the British position. This was the outcome of the working of a one-sided free-trade system. Now was the time for consolidating British trade relations with the colonies. A further increase of £26,000,000 a year in the trade with the colonies might be obtained by a preferential tariff, and this meant additional employment at home for 166,000 workmen, or subsistence for a population of a far larger number. His positive proposals were: (1) no tax on raw materials; (2) a small tax on food other than colonial, *e.g.*, two shillings a quarter on foreign corn but excepting maize, and 5% on meat and dairy produce excluding bacon; (3) a 10% general tariff on imported manufactured goods. To meet any increased cost of living, he proposed to reduce the duties on tea, sugar and other articles of general consumption.

Colonial Preference.—"The colonies," he said, "are prepared to meet us; in return for a very moderate preference, they will give us a substantial advantage in their markets." This speech was the type of others which followed quickly during the year. At Greenock next day he emphasized the necessity of retaliating against foreign tariffs. The practice of "dumping" must be met; if foreign goods were brought into England to undersell British manufacturers, either the Fair Wages clause and the Factory Acts and the Compensation Act would have to be repealed, or the workmen would have to take lower wages, or lose their work, "Agriculture has been practically destroyed, sugar has gone, silk has gone, iron is threatened, wool is threatened, cotton will go! How long are you going to stand it?" In all his speeches he managed to point his argument by application to local industries. On Jan. 18, 1904, Chamberlain ended his series of speeches by a meeting at the Guildhall, in the city of London, the key-note being his exhortation to his audience to "think imperially."

Chamberlain needed a rest, and was away in Italy and Egypt from March to May, 1904, and again in November. He made three important speeches at Welbeck (Aug. 4), at Luton (Oct. 5), and at Limehouse (Dec. 15), but he had nothing substantial to add to his case. The Russo-Japanese War in Manchuria distracted popular attention from his campaign.

In Jan. 1905 some correspondence was published between Chamberlain and the duke of Devonshire, dating from the previous October, as to difficulties arising from the central Liberal-Unionist organization subsidizing local associations which had adopted the programme of tariff reform. The duke objected to this departure from neutrality, and suggested that it was becoming "impossible with any advantage to maintain under existing circumstances the existence of the Liberal-Unionist organization." Chamberlain retorted that this was a matter for a general meeting of delegates to decide; if the duke was out-voted he might resign his presidency; for his own part he was prepared to allow the local associations to be subsidized impartially, so long as they supported the Government, but he was not prepared for the violent disruption, which the duke apparently contemplated, of an association so necessary to the success of the Unionist cause. The duke was in a difficult position as president of the organization, since most of the local associations supported Chamberlain; and he replied that the differences between them were vital, and he would not be responsible for dividing the association into sections, but would rather resign. Chamberlain then called a general meeting on his own responsibility in February, when a new constitution was proposed; and in May, at the annual meeting of the Liberal-Unionist council, the free-food Unionists, being in a minority, retired, and the association was reorganized under Chamberlain's auspices, Lord Lansdowne and Lord Selborne (both of them cabinet ministers) becoming vice-presidents. On July 14 the reconstituted Liberal-Unionist organization held a great demonstration in the Albert hall, and Chamberlain's success in ousting the duke of Devonshire and the other free-trade members of the old Liberal-Unionist party, and imposing his own fiscal policy upon the Liberal-Unionist caucus, was now complete.

In reply to Balfour's appeal for the sinking of differences (Newcastle, Nov. 14), Chamberlain insisted at Bristol (Nov. 21) on the adoption of his fiscal policy; and Balfour resigned on Dec. 4 on the ground that he no longer retained the confidence of the party. At the crushing Unionist defeat in the general election which followed in Jan. 1906, Chamberlain was triumphantly returned for West Birmingham, and all the divisions of Birmingham returned Chamberlainite members. This, by contrast with the national disaster to the Unionist party as a whole, was one of the astonishing features of all British electoral history.

But he had no desire to set himself up as leader in Balfour's place, and after private negotiations with the ex-prime minister, a common platform was arranged between them, on which Balfour—for whom a seat was found in the City of London—should continue to lead the remnant of the party. The "Valentine's Day" formula was given in a letter from Balfour of Feb. 14 which admitted the necessity of making fiscal reform the first plank in the Unionist platform, and accepted a general tariff on manufactured goods and a small duty on foreign corn as "not in principle objectionable."

It may be left to future historians to attempt a considered judgment on the English tariff reform movement, and on Chamberlain's responsibility for the Unionist *débâcle* of 1906. But while his enemies taunted him with having twice wrecked his party—first the Radical party under Gladstone, and secondly the Unionist party under Balfour—no well-informed critic doubted his sincerity, or failed to recognize that in leaving the cabinet and embarking on his fiscal campaign he showed real devotion to an idea. In championing the cause of imperial fiscal union, by means involving the abandonment of a system of taxation which had become part of British orthodoxy, he followed the guidance of a profound conviction that the stability of the empire and the very existence of the hegemony of the United Kingdom depended upon the conversion of public opinion to a revision of the current economic doctrine. For the second time he had staked an already

established position on his refusal to compromise with his convictions on a question which appeared to him of vital and immediate importance.

Mr. Chamberlain's own activity in the political field was cut short in the middle of the session of 1906. His 70th birthday was celebrated in Birmingham with immense enthusiasm shared in spirit by the bulk of the Unionist party in Great Britain and by idealists of imperialism throughout the British dominions. His fatigue before this apotheosis was extreme. Immediately afterwards he had a stroke of paralysis. He never spoke in public again. Though, for some time, his adherents hoped that he might return to the House of Commons, he was quite incapacitated for any public work. At the general election of Jan. 1910 Chamberlain was returned unopposed for West Birmingham again. His last sad appearance in the House was in the February following when, while few members were present, the formality of signing the roll was performed for him by his eldest son.

He died at his house, Highbury, Birmingham, on July 2, 1914. His last speech had been made on July 9, 1906. In that speech he uttered words which may fairly be given as his political testament: "The union of the Empire," he said, "must be preceded and accompanied by a better understanding, by a better sympathy. To secure that is the highest object of statesmanship now at the beginning of the 20th century; and if these were the last words that I were permitted to utter to you, I would rejoice to utter them in your presence, and with your approval. I know that the fruition of our hopes is certain. I hope I may live to congratulate you upon our common triumph; but in any case I have faith in the people. I trust in the good sense, the intelligence and the patriotism of the majority, the vast majority, of my countrymen."

Joseph Chamberlain had a singularly happy home life, and during his long illness had the devoted attention of Mrs. Chamberlain. Both his sons, Joseph Austen and Arthur Neville, rose to high position amongst statesmen, and are separately noticed.

See H. W. Lucy, *Speeches of Joseph Chamberlain, with a sketch of his life* (1885); *Speeches on Home Rule and the Irish Question 1881-87* (1887); *Foreign and Colonial Speeches* (1897); *Imperial Union and Tariff Reform, 15 May-Nov. 4, 1903* (2nd ed. 1910); C. W. Boyd, *Mr. Chamberlain's Speeches* (2 vols., 1914). The authorized *Life of Chamberlain*, by J. L. Garvin, is in preparation. The existing biographies were written during Chamberlain's lifetime by N. M. Marris (1900), S. H. Jeyes (1903), Louis Creswick (4 vols., 1904), Alexander Mackintosh (1906) and by Viscount Milner, J. Spender, Sir Henry Lucy and others (pub. 1912). Much information, including letters and reports of conversations, is to be found in biographies of his contemporaries, notably in those of Gladstone, the duke of Devonshire, Granville, Goschen and Harcourt, which will be found noted under those heads. For the South African period see the despatches published in the parliamentary papers series, *Accounts and Papers* (Colonies and British Possessions, South Africa), for the years in question, and *The "Times" History of the War in South Africa* (edit. L. C. S. Amery, vol. i. and vi. 1900-09); and for the suggested *rapprochement* with Germany at the turn of the century, E. E. Adams, 1927); *Die Grossepolitik der Europäischen Kabinette, 1871-1914*; and F. Meinecke, *Geschichte des Deutsch-Englischen Bündnisproblems, 1890-1901* (1927).

CHAMBERLAIN, SIR NEVILLE BOWLES (1820-1902), British field-marshal, was born at Rio de Janeiro Jan. 10, 1820, the son of Henry Chamberlain, consul-general and chargé d'affaires in Brazil. He entered the East India Company's army in 1837 and served in the first Afghan war (1839-42), in the Gwalior campaign of 1843, and in the Punjab campaign of 1848-49. After that date, promotion was rapid, and he commanded several expeditions on the north-east frontier of the Punjab Frontier Force. During the Mutiny he became adjutant-general of the Indian Army, and for his services at the siege of Delhi and elsewhere was rewarded with a series of honours. He gained more honours after the Umbeyla campaign in 1863. Chamberlain was promoted to lieutenant-general in 1872, made G.C.S.I. in 1873, and G.C.B. in 1875. From 1876-81 he was commander-in-chief of the Madras army, and in 1879 was sent on a mission to Shere Ali, whose refusal to allow him to enter Afghanistan precipitated the

outbreak of the second Afghan war. Chamberlain agreed with Lord Lytton that the British Government should take steps to show its resentment at a "gross and unprovoked insult," but he did not approve of the policy of disintegration of Afghanistan adopted by Lytton after the second occupation of Kabul. He disapproved of the retention of Kandahar in 1880 on the ground of his knowledge of the increased difficulty involved in additional outposts. Chamberlain returned to England in 1881, and received the rank of field-marshal in 1900. He died at Lordswood, near Southampton, Feb. 18, 1902.

See W. H. Paget, *Record of the Expeditions against the North-West Frontier Tribes* (1884); G. W. Forrest, *Life of Chamberlain* (1909).

CHAMBERLAIN, etymologically, and also to a large extent historically, an officer charged with the superintendence of domestic affairs. Such were the chamberlains of monasteries or cathedrals, who had charge of the finances, gave notice of chapter meetings, and provided the materials necessary for the services. In these cases, as in that of the apostolic chamberlain of the Roman see, the title was borrowed from the usage of the courts of the western secular princes. A royal chamberlain is now a court official whose function is in general to attend on the person of the sovereign and to regulate the etiquette of the palace. He is the representative of the mediaeval *camberlanus*, *cambellanus* or *cubicularius*, whose office was modelled on that of the *praefectus sacri cubiculi* or *cubicularius* of the Roman emperors. But at the outset there was another class of chamberlains, the *camerarii*, i.e., high officials charged with the administration of the royal treasury (*camera*). The *camerarius* of the Carolingian emperors was the equivalent of the *hordere* or *thesaurarius* (treasurer) of the Anglo-Saxon kings; he develops into the *Erzkämmerer* (*archi-camerarius*) of the Holy Roman Empire, an office held by the margraves of Brandenburg, and the *grand chambrier* of France, who held his *chamberie* as a fief. Similarly in England after the Norman conquest the *hordere* becomes the chamberlain. This office was of great importance. Before the Conquest the *hordere* had been, with the marshal, the principal officer of the king's court; and under the Norman sovereigns his functions were manifold. As he had charge of the administration of the royal household, his office was of financial importance, for a portion of the royal revenue was paid, not into the exchequer, but in *camera regis*. In time the office became hereditary and titular, but the complexity of the duties necessitated a division of the work, and the office was split up into three: the hereditary and sinecure office of *magister camerarius* or lord great chamberlain (*q.v.*) the more important domestic office of *camerarius regis*, king's chamberlain or lord chamberlain (*q.v.*) and the chamberlains (*camerarii*) of the exchequer, two in number, who were originally representatives of the chamberlain at the exchequer, and afterwards in conjunction with the treasurer presided over that department. In 1826 the last of these officials died, when by an act passed 44 years earlier they disappeared.

In France the office of *grand chambrier* was early overshadowed by the *chamberlains* (*cubicularii*, *cambellani*, but sometimes also *camerarii*), officials in close personal attendance on the king, men at first of low rank, but of great and ever-increasing influence. As the office of *grand chambrier*, held by great feudal nobles seldom at court, became more and more honorary, the chamberlains grew in power, in numbers, and in rank, until, in the 13th century, one of them emerges as a great officer of State, the *chambellan de France* or *grand chambellan* (also *magister cambellanorum*, *mestre chamberlenc*), who at times shares with the *grand chambrier* the revenues derived from certain trades in the city of Paris. The honorary office of *grand chambrier* survived till the time of Henry II., who was himself the last to hold it before his accession; that of *grand chambellan*, which in its turn soon became purely honorary, survived till the Revolution. Among the prerogatives of the *grand chambellan*, which survived to the last, was the right to hand the king his shirt at the ceremonial levee. The offices of *grand chambellan*, *premier chambellan*, and *chambellan* were revived by Napoleon, continued under the Restoration, abolished by Louis Philippe, and again restored by Napoleon III.

In the papal Curia the apostolic chamberlain (*camerarius*) is at the head of the treasury (*camera thesauraria*) and, in the days of the temporal power, not only administered the papal finances but possessed an extensive civil and criminal jurisdiction. During a vacancy of the Holy See he is at the head of the administration of the Roman Church. The office dates from the 11th century, when it superseded that of archdeacon of the Roman Church, and the close personal relations of the *camerarius* with the pope, together with the fact that he is the official guardian of the ceremonial vestments and treasures, point to the fact that he is also the representative of the former *vestarius* and *vice-dominus*, whose functions were merged in the new office.

In England the modern representatives of the *cubicularii* are the gentlemen and grooms of the bed-chamber; in Germany were the *Kammerherr* (*Kämmerer*, from *camerarius*, in Bavaria and Austria) and *Kammerjunker*. The insignia of their office is a gold key attached to their coats behind.

Many corporations appoint a chamberlain. The chamberlain of the corporation of the city of London, who is treasurer of the corporation, admits persons to the freedom of the city, and, in the chamberlain's court, of which he and the vice-chamberlain are judges, exercises concurrent jurisdiction with the police court in determining disputes between masters and apprentices. Formerly nominated by the crown, since 1688 he has been elected annually by the liverymen. He has a salary of £2,000 a year. Similarly in Germany the administration of the finances of a city is called the *Kämmerei* and the official in charge of it the *Kämmerer*.

"Camerarius" and "Cambellanus"; Père Anselme (Pierre de Guibours), *Hist. généalogique et chronologique de la maison royale de France*, etc. (3rd ed. 1726-33); A. Luchaire, *Manuel des institutions françaises* (1892); W. R. Anson, *Law and Custom of the Constitution* (1896); Hinschius, *Kirchenrecht*, i. 405 (1869).

CHAMBERLAYNE, WILLIAM (1619-1679), English poet, died on July 11, 1679. Nothing is known of his history except that he practised as a physician at Shaftesbury in Dorsetshire, and fought on the Royalist side at the second battle of Newbury. His works are: *Pharonnida* (1659), a verse romance in five books; *Love's Victory* (1658), a tragi-comedy, acted under another title in 1678 at the Theatre Royal; *England's Jubilee* (1660), a poem in honour of the Restoration. A prose version of *Pharonnida*, entitled *Eromena* or *The Noble Stranger*, appeared in 1683. Southey speaks of him as "a poet to whom I am indebted for many hours of delight." *Pharonnida* was reprinted by S. W. Singer in 1820, and again in 1905 by Prof. G. Saintsbury in *Minor Poets of the Caroline Period* (vol. i.). The poem is loose in construction, but contains some passages of great beauty.

CHAMBERLIN, THOMAS CHROWDER (1843-1928), American educator and geologist, was born at Mattoon, Ill., on Sept. 25, 1843. He graduated at Beloit college in 1866 (A.B.) and returned to the college in 1873 as professor of geology, serving also as assistant State geologist of Wisconsin until 1876, when he was made chief geologist of the Wisconsin Geological Survey (1876-82). From 1882 to 1887 he served as U.S. geologist in charge of the glacial division; from 1887 to 1892, as president of the University of Wisconsin; from 1892 to 1919, as head of the geological department of the University of Chicago, retiring as professor emeritus in 1919. He studied glaciers in Switzerland in 1878 and in Greenland in 1894, as geologist to the Peary relief expedition. His principal scientific work in later years has been the study of fundamental problems in geology particularly as related to the origin and growth of the earth, the developing of the planetesimal hypothesis of the planets, planetoids and satellites; and the chondritic hypothesis of the origin of chondrules, comets and meteorites. He died in Chicago, Nov. 15, 1928.

His chief publications are *Geology of Wisconsin* (1879-82); *Reports of the Glacial division U.S. Geol. Survey* (1882-87); a three-volume treatise on geology (with R. D. Salisbury, 1906); reports on researches on certain fundamental problems in geology to the Carnegie Institution of Washington, *Year Books* 2 to 27; *The Tidal and Other Problems* (1909), "Diastrophism and the Formative Processes," numerous articles in the *Journal of Geol-*

ogy, vol. xxi. (1913-21); *The Origin of the Earth* (1916); *The Two Solar Families, The Sun's Children* (1928).

CHAMBER MUSIC, a term obviously denoting music for performance in a room of a private house, has acquired the special meaning of large works in the sonata style for a group of individual instruments; although it may be borne in mind that in the early 18th century vocal cantatas for solo voices were at least as important as purely instrumental compositions.

One feature of immaturity is common to all the chamber music, vocal and instrumental, between and including Corelli and Bach; namely, that the harmonic background is left to the harpsichord player to extemporize from the indications given by a figured bass (*q.v.*). Even works with elaborate obligato harpsichord parts, have passages which presuppose this extempore element. Only the concerted music of the French clavecinists Couperin and Rameau consistently leaves nothing undetermined.

Works with Continuo.—The forms of chamber music are those of music at large, and it has no independent history. But it is very definite in the principles which determine its texture; and the element of the figured bass or continuo puts the earlier chamber music into an altogether different category from the art which arose with Haydn. As is shown in the articles **INSTRUMENTATION**, **MUSIC** and **SONATA FORMS**, the sonata-style of Haydn and Mozart irrevocably brought the dramatic element into music; but in addition to this, it brought alike into chamber music and orchestral music a fundamental principle that all players in an instrumental combination should between them provide their own harmonic background without the aid of a continuo part.

The disappearance of the continuo in later chamber music marks the realization of the central classical idea of the style, according to which there is no part in the ensemble left either indeterminate or in permanent subordination.

With its disappearance must also disappear the conception of the ensemble as a group of treble instruments over a firm bass, requiring a middle mass of harmony on an altogether remoter plane to hold them together. The middle part must be on the same plane as the others, and all must be as ready to provide the background as to carry on the main lines. There were no string quartets in the continuo period; and, what is more significant, the viola parts in the orchestra of Bach and Handel are, except when accompanying a choral fugue, neither interesting in themselves nor sufficient to fill up the gap between violins and bass. Their function is to reinforce the continuo without going a step out of their way to make the harmony always complete.

Haydn's first Quartets.—Rightly understood and performed, the result is perfectly mature; but it is worlds away from the crudest of Haydn's first quartets which, written before the death of Handel, show the criterion of self-sufficiency firmly established, so that there is no room for a continuo. The first string quartets are not clearly distinguished from orchestral music; wind parts have been discovered for Haydn's op. 1, No. 5 and op. 2, No. 3, and Haydn throughout his life remained capable of occasionally forgetting that his quartet-violoncello was not supported by a double-bass. But few processes in the history of music are more fascinating than the steady emergence of Haydn's quartet-style from the matrix of orchestral habit. In the quartets of op. 9 which he afterwards wished to regard as the beginning of his work, the four string parts are equally necessary and equally alive. They are not equally prominent; because the criterion is not polyphony but self-sufficiency for the purposes of this kind of music; and in this kind of music the normal place for melody is on the top.

In the very important six quartets, op. 20, Haydn discovers the character of the violoncello as something more than a bass to the violins—you can hear him discover it in the fourth bar of op. 20, No. 1; and with this discovery all possibility of the use of a double-bass vanishes, though miscalculations occur in the latest quartets. Had Haydn been a great violoncellist his first quartets might have been as luxurious as the quintets of Boccherini (*q.v.*), and he might have dallied longer in the bypaths of a style which tries to give each instrument in turn its display

of solo-work. But Haydn's line of progress is steady and direct, and no document in the history of music is more important than his op. 20, with its three fugues (which secure autonomy and equality of parts by a return to the old polyphony), its passages of turn-about solo, its experiments in rich and special effects, and, most important of all, its achievements in quite normal quartet-writing such as pervades the remaining forty-odd quartets which end with his pathetic last fragment, op. 103.

Haydn's pianoforte trios also cover his whole career but they show, from first to last, no effort to achieve more than pianoforte sonatas with string accompaniment.

Mozart.—Mozart was an inveterate polyphonist by the time he was 12 years old, and the character of the viola, unnoticed by Haydn in his ripest quartets, is imaginatively realized in quartets written by Mozart at the age of 17. The point is not that the viola takes part in a more polyphonic style (though Mozart's early quartets are full of contrapuntal and canonic forms) but that the composer's imagination is attentive to the tone of the instrument in every note he writes for it.

Mozart's pianoforte trios, which are very insufficiently appreciated by historians and players, are perfect examples of independence of parts, no less than the two great pianoforte quartets (which should have been six but that the publisher cried off his bargain because of their difficulty) and the quintet for pianoforte and wind instruments. The set of six great string quartets (avowedly inspired by and affectionately dedicated to Haydn) contains some of the profoundest music outside Beethoven; and of the four remaining quartets, the last three, written for the King of Prussia, who was a good violoncellist, gave his majesty a grateful and prominent part and showed that Mozart's wit was able to maintain the full greatness of his style even when he was restricted to a lighter vein of sentiment.

His string quintets are as great as the quartets. Mozart prefers a second viola as the fifth member; and the only case where he suggested a second violoncello was by way of substitute for the horn in a little quintet for the curious combination of one violin, two violas, violoncello and horn. The combination of wind instruments with strings is a special problem the mention of which brings us back to reconsider the central idea of chamber music as now realized by Haydn and Mozart.

Vocal music has here dropped below the horizon. The human voice inevitably thrusts all instruments into the background; and we are now at the stage where the forces engaged in chamber music must be on planes sufficiently near to combine in one mental focus. A slight divergence of plane will give the mind pleasures analogous to those of stereoscopic vision. For example, the greatest masters of chamber music with pianoforte take pleasure in supporting heavy but incomplete pianoforte chords by the low notes of the violoncello: a procedure puzzling to self-centred pianoforte virtuosos, and never risked by composers who have not attained a pure style. Again, the clarinet, in the wonderful quintets by Mozart (A major) and Brahms (B minor) does not and is not intended to blend with the strings, but it nowhere gives a more intense pleasure than where it behaves as an inner part exactly like the others. These works belong to the highest regions of the art.

Wind and Other Combinations.—The flute blends with nothing; even among other wind instruments it is like water-colour among oils. It accordingly plays a part in witty little works, such as Beethoven's serenade for flute, violin and viola (twice imitated by Reger), and Mozart's two quartets with strings. The oboe, once not much less important in continuo chamber music than the flute (Handel confessed to "writing like a devil for it" when he was a boy) requires other wind instruments to relieve the ear of its plaintive tone, though Mozart wrote a pretty little quartet for it with strings, and Beethoven achieved a remarkable *tour-de-force* in an early trio for two oboes and cor anglais. But the further consideration of wind instruments brings us again to the borderland regions of chamber music. What are the smallest forces that can make a coherent combination for chamber music; and at what point do the forces become too large to cohere?

The pianoforte, even when treated in Mozart's hard-pencil line-drawing style, provides a central mass of complete harmony that can absorb shocks and combine (*pace* the virtuoso player) with anything. The question begins to be interesting when we deal with the strings alone. Duets for two violins are obviously a *tour-de-force*, since their bass can never go below a contralto G. This *tour-de-force* is executed on a large scale with a mastery and euphony beyond praise by Spohr. Mozart, coming to the rescue of Michael Haydn, who was prevented by illness from completing a set of six commissioned by the archbishop of Salzburg, wrote two for violin and viola, which profit greatly by the extra lower fifth and which are written with great zest and a reckless disregard (justified by personal knowledge) of the chance that the archbishop might detect their difference from the dutiful efforts of brother Michael.

Trios for two violins and any kind of bass but the viola, are ominously suggestive of a return to, or non-emergence from, the continuo method; and indeed it may be doubted whether any Italian composer before Cherubini (*q.v.*) ever did quite emerge therefrom. Trios for violin, viola and violoncello are a very different matter. They represent the problem of the string quartet intensified into a *tour-de-force*. Mozart's great example, the divertimento in E flat, is in all its six movements on a scale and a plane of thought that its title vainly belies. It inspired Beethoven to one of his biggest early works, the Trio op. 3; and the success of this encouraged Beethoven to write the three string Trios op. 9, of which the first, in G major, and the third, in C minor, are bolder in conception and execution than even the largest of the six string quartets, op. 18, and not less sonorous than any string quartet written before or since.

The string quartet represents the normal apparatus for a chamber music work of homogeneous tone. String quintets are usually produced in Mozart's way by doubling the viola. Doubling the violoncello, as in Schubert's great C major quintet, produces a very rich tone and sets the first violoncello free to soar into the cantabile region without (as in other quintets and in quartets) depriving the ensemble of a deep bass. Sextets, for two violins, two violas and two violoncellos, are represented in the two great works of Brahms. Octets for strings show signs of clotting into an orchestral style. Spohr hit upon the device of dividing the eight into antiphonal quartets; and his four double quartets are much nearer to the true style of chamber music than his string quartets, where his lower parts have the simplicity of early Haydn while the first violin plays a concerto above them. Mendelssohn in the wonderful octet which he wrote at the age of 16, does not find Spohr's simple antiphonal scheme worth the trouble of specially grouping the players when he can use 255 different combinations of the eight without enquiring how they are seated.

As for the semi-orchestral borderland of septets and octets in which several wind instruments join and a double-bass adds depth without any normal capacity to rise into cantabile or solo work, this borderland (inhabited by Beethoven's septet, Schubert's octet and many glorious serenades and divertimenti of Mozart) has a fascinating aesthetic of its own. Wind instruments by themselves are happiest in pairs, as their tones contrast too sharply otherwise to blend at all, though Reicha, who composed regularly for two hours before breakfast every morning, ground out over 100 quintets for flute, oboe, clarinet, horn and bassoon, all admirably euphonic, if they are up to the sample passages quoted by him in his treatise on composition. It is unreasonable to blame Mozart's glorious serenade for 13 wind instruments for sounding like a military band; we ought rather to wish that a military band could sound like a Mozart serenade.

Modern Tendencies.—Nothing remains to be said about chamber music, classical or modern, apart from the general tendencies of the art. The exclusive prevalence of sonata form in the classics is a result of the fact that when several persons assemble to play together they prefer to make the most of their opportunity. Smaller works are liable to be overlooked; how otherwise can we account for the fact that most musicians do not realize the existence of three quiet minutes of the most delicate writing in Beethoven's third manner, the quintet-fugue op. 137? A spirited

capriccio and a pretty fugue by Mendelssohn have dropped out of sight for no other reason, while the andante and scherzo published with them and Schubert's allegro in C minor have roused interest as fragments of full-sized works.

In modern times the sonata form no longer obstructs the view of other possibilities. Mr. W. W. Cobbett's prize competitions have stimulated English composers to the production of fantasies in terse continuous-movement forms. Less important are the numerous experiments in the use of the human voice without words in an otherwise instrumental scheme. Nature responds cattishly to the pitchfork. Saint-Saëns has a charming manner which puts the trumpet on its best behaviour in his amusing septet. The trombone and side-drums in the chamber music of Stravinsky will do well enough in a very smart house-party where all the conversation is carried on in an esoteric family slang and the guests are expected to enjoy booby-traps. Very different is the outlook of some of our younger masters such as Hindemith, Jarnach, and others whose renunciation of beauty is in itself a youthfully romantic gesture, and is accompanied by endless pains in securing adequate performance. The work of masterly performers can indeed alone save the new ideas from being swamped in a universal dullness which no external smartness can long distinguish from that commemorated in the Dunciad.

(D. F. T.)

CHAMBER ORCHESTRA, a small orchestra of some 20 or 30 players suited to the performance of works of the smaller and lighter order.

CHAMBERS, EPHRAIM (d. 1740), English encyclopaedist, was born at Kendal, Westmorland, and apprenticed to a globe-maker in London. The first edition of his *Universal Dictionary of Arts and Sciences* appeared by subscription in 1728, in two vols., fol., dedicated to the king. The *Encyclopédie* of Diderot and d'Alembert owed its inception to a French translation of Chambers's work. In addition to the *Cyclopaedia*, Chambers wrote for the *Literary Magazine* (1735-36), and translated the *History and Memoirs of the Royal Academy of Sciences at Paris* (1742), and the *Practice of Perspective* from the French of Jean Dubreuil. He died on May 15, 1740.

CHAMBERS, GEORGE (1803-1840), English marine painter, born at Whitby, Yorkshire, was the son of a seaman, and for several years he pursued his father's calling. He then took lessons from a drawing-master, and found a ready sale for small and cheap pictures of shipping. Coming to London, he was employed by Thomas Horner to assist in painting the great panorama of London for the Colosseum (the exhibition building in Regent's park, demolished c. 1860). His best works represent naval battles. Two of these—the "Bombardment of Algiers in 1816," and the "Capture of Porto Bello"—are in Greenwich hospital. He died on Oct. 28, 1840.

A *Life*, by John Watkins, was published in 1841.

CHAMBERS, ROBERT (1802-1871), Scottish author and publisher, was born at Peebles on July 10, 1802. A small circulating library in the town, and a copy of the *Encyclopaedia Britannica* which his father had purchased, furnished the boy with stores of reading of which he eagerly availed himself. Long afterwards he wrote of his early years—"Books, not playthings, filled my hands in childhood. At 12 I was deep, not only in poetry and fiction, but in encyclopaedias." The family removed to Edinburgh in 1813, and in 1818 Robert began business at 16 as a bookstall-keeper in Leith Walk. In 1819 his elder brother William had begun a similar business, and the two eventually united as partners in the publishing firm of W. and R. Chambers. Robert Chambers was an enthusiast for the history and antiquities of Edinburgh, and his *Traditions of Edinburgh* (1824), secured for him the personal friendship of Sir Walter Scott. A *History of the Rebellions in Scotland from 1638 to 1745* (1828), and numerous other works followed.

At the beginning of 1832 William Chambers started a weekly publication under the title of *Chambers's Edinburgh Journal* (known since 1854 as *Chambers's Journal of Literature, Science and Arts*), which speedily attained a large circulation.

Among the numerous works of which Robert was in whole

or in part the author, the *Biographical Dictionary of Eminent Scotsmen* (Glasgow, 1832-35), the *Cyclopaedia of English Literature* (1844), the *Life and Works of Robert Burns* (1851), *Ancient Sea Margins* (1848), the *Domestic Annals of Scotland* (1859-61) and the *Book of Days* (1862-64) were the most important. *Chambers's Encyclopaedia* (1859-68), with Dr. Andrew Findlater as editor, was carried out under the superintendence of the brothers (see *ENCYCLOPAEDIA*).

As a geologist, Robert Chambers published *Tracings of the North of Europe* (1851) and *Tracings in Iceland and the Farøe Islands* (1856). His knowledge of geology was one of the principal grounds on which the authorship of the *Vestiges of the Natural History of Creation* (1843-46) was eventually assigned to him. The *Book of Days*, a miscellany of popular antiquities, was his last publication. He died at St. Andrews on March 17, 1871.

His brother, **WILLIAM CHAMBERS** (1800-83), the financial genius of the publishing firm, was born at Peebles, on April 16, 1800. He laid the city of Edinburgh under the greatest obligations by his public spirit and munificence. As lord provost he procured the passing in 1867 of the Improvement Act, which led to the reconstruction of a great part of the Old Town, and at a later date he proposed and carried out, largely at his own expense, the restoration of the noble and then neglected church of St. Giles, making it in a sense "the Westminster Abbey of Scotland." This service was fitly acknowledged by the offer of a baronetcy, which he did not live to receive, dying on May 20, 1883, three days before the reopening of the church. He was the author of a history of St. Giles, of a memoir of himself and his brother (1872), and of many other useful publications. On his death in 1883 Robert Chambers (1832-88), son of Robert Chambers, succeeded as head of the firm, and edited the *Journal* until his death. His eldest son, Charles Edward Stuart Chambers (b. 1859), became editor of the *Journal* and chairman of W. & R. Chambers, Ltd.

See also *Memoir of Robert Chambers, with Autobiographic Reminiscences of William Chambers* (1872), the 13th ed. of which (1884) has a supplementary chapter; Alexander Ireland's preface to the 12th ed. (1884) of the *Vestiges of Creation*; the *Story of a Long and Busy Life* (1884), by William Chambers; and some discriminating appreciation in James Payn's *Some Literary Recollections* (1884), chapter v. The *Select Writings of Robert Chambers* were published in seven vols. in 1847, and a complete list of the works of the brothers is added to *A Catalogue of Some of the Rarer Books . . . in the Collection of C. E. S. Chambers* (Edinburgh, 1891).

CHAMBERS, SIR WILLIAM (1726-1796), British architect, was the grandson of a rich merchant who had financed the armies of Charles XII., but was paid in base money, and whose son remained in Sweden many years endeavouring to obtain redress. In 1728 the latter returned to England and settled at Ripon, where William, who was born in Stockholm, was educated. At the age of 16 he became supercargo to the Swedish East India Company, and, voyaging to Canton, made drawings of Chinese architecture, furniture and costume which served as basis for his *Designs for Chinese Buildings*, etc. (1757). Two years later he quitted the sea to study architecture seriously, and spent a long time in Italy, devoting special attention to the buildings of classical and Renaissance architects. He also studied under Clérissieu in Paris, with whom, and with the sculptor Wilton, he lived at Rome. In 1755 he returned to England where his first important commission was a villa for Lord Bessborough at Rotherhampton, but he made his reputation by the grounds he laid out and the buildings he designed at Kew, among them being the pagoda in the gardens, between 1757 and 1762 for Augusta, princess dowager of Wales. He published (1759) a *Treatise on Civil Architecture* and in 1772 a *Dissertation on Oriental Gardening*, which attempted to prove the inferiority of European to Chinese landscape gardening. As a furniture designer and internal decorator he is credited with the creation of that "Chinese Style" which was for a time furiously popular, although Thomas Chippendale (q.v.) had published designs in that manner at a somewhat earlier date. He became architect to the king and queen, comptroller of his majesty's works, and afterwards surveyor-general. In 1775 he was appointed architect of Somerset House, his greatest monument, at a salary of £2,000 a year. He

also designed town mansions for Earl Gower at Whitehall and Lord Melbourne in Piccadilly, built Charlemont House, Dublin, and Duddingston House, near Edinburgh. He designed the market house at Worcester, was employed by the earl of Pembroke at Wilton, by the duke of Marlborough at Blenheim, and by the duke of Bedford in Bloomsbury. Although his practice was mainly classic, he made Gothic additions to Milton Abbey in Dorset. Sir William numbered among his friends Dr. Johnson, Goldsmith, Sir Joshua Reynolds, David Garrick and Dr. Burney.

CHAMBERS, in law, the rooms of counsel or of judges or judicial officers who deal with questions of practice and other matters not of sufficient importance to be dealt with in court. It is doubtful at what period the practice of exercising jurisdiction "in chambers" commenced in England; there is no statutory sanction before 1821, though the custom can be traced back to the 17th century. An Act of 1821 provided for sittings in chambers in vacation, and an Act of 1822 empowered the sovereign to call upon the judges by warrant to sit in chambers on as many days in vacation as should seem fit, while the Law Terms Act, 1830, defined the jurisdiction to be exercised at chambers. The Judges' Chambers Act, 1867, was the first Act, however, to lay down proper regulations for chamber work, and the Judicature Act, 1873, preserved that jurisdiction and gave power to increase it as might be directed or authorized by rules of court to be thereafter made. (See PRACTICE and PROCEDURE.)

CHAMBERSBURG, a borough of Franklin county, Pennsylvania, U.S.A., on an elevated site in the broad and fertile Cumberland valley, 52 m. S.W. of Harrisburg; it is on Federal highways 11 and 30, and is served by the Pennsylvania and the Western Maryland railways. The population in 1920 was 13,171; 1930 it was 13,788. It is the county seat, and has large grain elevators and various factories with an output in 1925 valued at \$6,845,716. Wilson college, a Presbyterian institution for women, chartered in 1869, is situated here. Chambersburg was founded in 1730 by Benjamin Chambers. He built a stone fort after Gen. Braddock's defeat (1755) and surrounded it with a stockade as a defence against the Indians. At Chambersburg Gen. Lee massed his troops for his attack on Gettysburg. On July 30, 1864, a large part of the borough was burned by Confederates. The birthplace of President Buchanan is near by, and rom. E. is Caledonia park, a State forest preserve of 260 acres.

CHAMBERS OF COMMERCE: see TRADE ORGANIZATION.

CHAMBER SYMPHONY, a musical composition written for a small orchestra exceeding in numbers the largest of the ordinary chamber music combinations (octet or nonet) but not approaching those of a full orchestra, and confined usually to a single instrument in each class. Such a work is Franz Schreker's *Kammersymphonie* for 23 solo instruments; another has been written by Schönberg.

CHAMBÉRY, a city of France, capital of the department of Savoie, pleasantly situated on the Leisse, in a fertile valley among the Alps, 79m. by rail S.S.W. of Geneva. Pop. (1926) 19,474. It was formerly capital of the duchy of Savoy, and remains, with its quiet narrow streets and its girdle of boulevards, a typical old provincial capital of France. The neighbouring country is dotted with summer resorts, and the town is a favourite centre for excursions. Chambéry grew up around a castle of the counts of Savoy, who resided there in the 13th, 14th and 15th centuries. A Roman station (*Lemincum*) in the vicinity has given its name to the rock of Lémenc, which overlooks the town on the north. Between 1536 and 1713 Chambéry was several times occupied by the French; in 1742 it was captured by a Franco-Spanish army; and in 1792 it was occupied by the Republican forces, and became the capital of the department of Mont Blanc. Restored to the house of Savoy by the treaties of Vienna and Paris, it was again surrendered to France in 1860.

The principal buildings are the cathedral, dating from the 14th and 15th centuries; the Hôtel-Dieu, founded in 1647, and the castle, a modern building serving as the prefecture, with only a great square tower belonging to the original structure; Chambéry is the seat of an archbishop (raised from a bishopric in 1817) and

of a superior tribunal. It has long been famous as a regional culture-centre, and possesses an academy (1819) and several learned societies. Local benefactions have profited greatly from the fortune of General Boigne (1751-1830), amassed in India. Among the manufactures are silk-gauze, lace, leather and hats: there are also aluminium-works.

CHAMBORD, HENRI CHARLES FERDINAND MARIE DIEUDONNÉ, COMTE DE (1820-1883), the "King Henry V." of the French legitimists, was born in Paris on Sept. 29, 1820, son of the duc de Berry, the elder son of the comte d'Artois (afterwards Charles X.), and princess Caroline Ferdinande Louise of Naples. Born seven months after the assassination of his father, he was hailed as the "enfant du miracle," and was made the subject of one of Lamartine's most famous poems. He was created duc de Bordeaux, and in 1821, as the result of a subscription organized by the Government, received the château of Chambord. His education was inspired by detestation of the French Revolution and its principles. After the revolution of July, Charles X. vainly endeavoured to save the Bourbon cause by abdicating in his favour and proclaiming him king under the title of Henry V. (Aug. 2, 1830). The comte de Chambord accompanied his grandfather into exile, and resided successively at Holyrood, Prague and Görz. The death of his grandfather, Charles X., in 1836, and of his uncle, the duc d'Angoulême, in 1844, left him the last male representative of the elder branch of the Bourbon family; and his marriage with the archduchess Maria Theresa, eldest daughter of the duke of Modena (Nov. 7, 1846), remained without issue. The title to the throne thus passed to the comte de Paris, as representative of the Orleans branch of the house of Bourbon, and the history of the comte de Chambord's life is largely an account of the efforts made to unite the Royalist party by effecting a reconciliation between the two princes.

Though he continued to hold an informal court, both on his travels and at his castle of Frohsdorf, near Vienna, yet he allowed the revolution of 1848 and the *coup d'état* of 1851 to pass without any decisive assertion of his claims. It was the Italian war of 1859, with its menace to the pope's independence, that roused him at last to activity, thus making common cause with the Church. The Royalists now began an active campaign against the Empire. On Dec. 9, 1866, Chambord addressed a manifesto to Gen. Saint-Priest, in which he declared the cause of the pope to be that of society and liberty, and held out promises of retrenchment, civil and religious liberty "and above all honesty." Again, on Sept. 4, 1870, after the fall of the Empire, he invited Frenchmen to accept a Government "whose basis was right and whose principle was honesty," and promised to drive the enemy from French soil. Fortune favoured him. The elections placed the Republican party in a minority in the National Assembly; the abrogation of the law of exile against the royal family permitted him to return to his castle of Chambord; and it was thence that on July 5, 1871, he issued a proclamation, in which for the first time he publicly posed as king, and declared that he would never abandon the white standard of the Bourbons, "the flag of Henry IV., Francis I., and Joan of Arc," for the tricolour of the Revolution. He again quitted France, and answered the attempts to make him renounce his claims in favour of the comte de Paris by the declaration (Jan. 25, 1872) that he would never abdicate. A constitutional programme, signed by some 280 members of the National Assembly was presented for his acceptance, but without result. The fall of Thiers in May 1873, however, offered an opportunity to the Royalists by which they hastened to profit. The comte de Paris and the prince de Joinville journeyed to Frohsdorf, and were formally reconciled with the head of the family (Aug. 5). The Royalists were united, the premier (the duc de Broglie) an open adherent, the president (MacMahon) a benevolent neutral. MM. Lucien Brun and Chesnelong were sent to interview the comte de Chambord at Salzburg, and obtain the definite assurances that alone were wanting. They returned with the news that he accepted the principles of the French Revolution and the tricolour flag. But a letter to Chesnelong, dated Salzburg, Oct. 27, declared that he had been misunderstood: he

would give no guarantees; he would not inaugurate his reign by an act of weakness, nor become "le roi légitime de la Révolution." "Je suis le pilote nécessaire," he added, "le seul capable de conduire le navire au port, parce que j'ai mission et autorité pour cela." A last effort was made in the National Assembly in June 1874 by the duc de la Rochefoucauld-Bisaccia, who formally moved the restoration of the monarchy. The comte de Chambord on July 2 issued a fresh manifesto, which added nothing to his former declarations. The motion was rejected by 272 to 79, and on Feb. 25, 1875, the Assembly definitely adopted the Republic as the national form of Government. The count died at Frohsdorf on Aug. 24, 1883.

See *Manifestes et programmes politiques de M. le comte de Chambord, 1848-73* (1873), and *Correspondance de la famille royale et principalement de Mgr. le comte de Chambord avec le comte de Bouillé* (1884). Of the enormous literature relating to him, mention may be made of *Henri V. et la monarchie traditionnelle* (1871); *Le Comte de Chambord étudié dans ses voyages et sa correspondance* (1880); H. de Pène, *Henri de France* (1885), and P. Rocher, *Le Duc de Bordeaux* (4 parts) of which two only, *La Jeunesse du Dernier Bourbon . . . 1830-44* (1923), and *Le Dernier Enfant de France . . . 1820-30* (1925), have as yet appeared.

CHAMBORD, a village of central France, in the department of Loir-et-Cher, on the left bank of the Cosson, 10 m. E. by N. of Blois. Pop. (1926) 183. The village stands in the park of Chambord, which is enclosed by a wall 22 m. in circumference. The celebrated château (see ARCHITECTURE) forms a parallelogram flanked at the angles by round towers and enclosing a square block of buildings, the façade of which forms the centre of the main front. There is a chapel of the 16th century and a famous double staircase. The château was originally a hunting-lodge of the counts of Blois, the rebuilding of which was begun by Francis I. in 1526, and completed under Henry II. It was the residence of several succeeding monarchs, and under Louis XIV. considerable alterations were made. In the same reign Molière's *Monsieur de Pourceaugnac* and *Le Bourgeois gentilhomme* were performed here for the first time. Stanislas of Poland lived at Chambord, which was bestowed by his son-in-law, Louis XV., upon Marshal Saxe. It was given by Napoleon to Marshal Berthier, from whose widow it was purchased by subscription in 1821, and presented to the duc de Bordeaux, who assumed the title of comte de Chambord. On his death it came by bequest to the family of Parma. The estate was sequestered in 1914.

CHAMBRE ARDENTE, the term for an extraordinary court of justice in France, mainly held for the trials of heretics (Fr. "burning chamber"). These courts were originated by the Cardinal of Lorraine, the first of them meeting in 1535 under Francis I. The *Chambre Ardente* co-operated with an inquisitorial tribunal also established by Francis I., the duty of which was to discover cases of heresy and hand them over for final judgment to the *Chambre Ardente*. The court was abolished in 1682.

See N. Weiss, *La Chambre Ardente* (Paris, 1889).

CHAMELEON, the common name of members of one of the sub-orders of lizards; the same name is used also for the American

lizards of the genus *Anolis* (Iguanidae). The great majority of the species of this sub-order are referable to the genus *Chamaeleon* (containing about 70 species), the remaining two genera, *Rhampholeon* and *Brookesia*, containing only a few dwarfed forms. The geographical range of the group is the whole of Africa and Madagascar, Arabia, southern India and Ceylon, but it is in the forests of central Africa and Madagascar that most diversified forms occur. The grasping feet are formed by the fusion of the digits into two opposable bundles, the two outer digits being opposed to the three inner on the fore-limb and vice versa on the hind-limb, and, like the prehensile tail, are correlated with the arboreal habits of these animals. The eyes are large and independently movable, but the eyelids are fused into one circular fold which leaves only the pupil visible; the eyes can also, unlike those of

INDIAN CHAMELEON, WHOSE TELESCOPIC TONGUE CAPTURES INSECTS SIX INCHES DISTANT

other reptiles, be focussed upon one spot, giving the binocular vision necessary for the nice appreciation of distances required in the use of the tongue. This organ is very large, club-shaped and provided with a sticky secretion at its tip; the basal portion is narrow and composed of very elastic fibres, which, when the tongue is not in use, are telescoped over the elongated copular piece of the hyoid which acts as a support. By filling the apparatus with blood and by the action of certain muscles the tongue can be shot out to a remarkable distance, seven or eight inches in a full-grown specimen of the common north African species (*C. chamaeleon*); the elasticity of the basal fibres assists in its rapid withdrawal. It is by means of this extraordinary mechanism that the chameleon secures its prey; flies and other insects are deliberately stalked until within range, then out shoots the tongue and the victim is withdrawn adhering to its sticky tip.

The ability of chameleons to change colour has made their name almost proverbial, but their powers are usually exaggerated and are quite equalled by those of some other lizards. Change of colour is partly reflex and partly controlled by the will; changes in the intensity of light, change of temperature and emotion produce marked and characteristic changes, but there is little direct response to the colour of the environment. The normal colour of the common chameleon may be grey-green with innumerable small dark specks and with rows of pale brown patches on the sides of the body; in the dark at normal temperatures the colour fades to a cream-colour with irregular yellow spots but exposure to hot sunlight causes the whole animal to darken until it may be uniformly dull black. High temperatures without direct sunlight usually produce greens and low temperatures dull greys; excitement and fright bring paler shades with brown patches and yellow spots whilst anger causes the lighter areas to darken. Blue and red do not seem to be within the range of this particular species but the combinations of green, yellow, brown, black and white and their various shades are almost endless.

Propagation is in most cases by means of eggs; these are small, oval, white in colour and provided with a tough parchment-like shell. They are buried by the mother and left to be incubated by the heat of the sun. A few species, e.g., the dwarf chameleon of South Africa (*C. pumilus*), retain the eggs within the body until they hatch, so that the young are born alive.

An extraordinary feature of the group is a tendency towards the production of excrescences on the head. Many species have the occiput produced backwards into a pointed casque and this may assume extraordinary dimensions; but the most remarkable developments are the horns of some of the tropical African and Malagasy species. In different forms there may be one, two or three horns or a single, flexible, dermal flap on the tip of the snout; in some species these appendages occur only on the male but in others they are present on both sexes. (D. M. S. W.)

CHAMFER, CHAMFER or CHAUMFER, an architectural term for the cutting off of the edges of the corners of a beam, post or other similar form, and also the slanting surface so produced. Chamfers are frequently hollowed or moulded. When the chamfer does not run the full length of the member that it decorates, the shoulder, diagonal cut or moulding against which it stops is known as a stop chamfer.

CHAMFORT, SEBASTIEN ROCH NICOLAS (1741-1794), French wit and man of letters, was born at a little village near Clermont in Auvergne, the son of a grocer named Nicolas. Educated as a free scholar at the Collège des Grassins, he lived from hand to mouth in Paris mainly on the hospitality of people who were only too glad to give him board and lodging in exchange for the pleasure of the conversation for which he was famous. Thus Mme. Helvétius entertained him at Sèvres for some years. He had a great success with his comedies *La Jeune Indienne* (1764) and *Le Marchand de Smyrne* (1770). In 1775, while taking the waters at Barèges, he met the duchesse de Grammont, sister of Choiseul, through whose influence he was introduced at court. In 1776 his poor tragedy *Mustapha et Zeangir*, was played at Fontainebleau before Louis XVI. and Marie Antoinette; the king gave him a further pension of 1,200 livres, and the prince de Condé made him his secretary. But he was a Bohemian naturally

and by habit, and the restraints of the court irked him. In 1781 he was elected to the Academy; in 1784, through the influence of Calonne, he became secretary to the king's sister, Mme. Elizabeth, and in 1786 he received a pension of 2,000 livres from the royal treasury. He was thus once more attached to the court, and made himself friends in spite of the reach and tendency of his unalterable irony; but he quitted it for ever after an unfortunate and mysterious love affair, and was received into the house of M. de Vaudreuil. Here in 1783 he had met Mirabeau, with whom he remained to the last on terms of intimate friendship.

The outbreak of the Revolution made a profound change in Chamfort's life. Theoretically he had long been a republican, and he now devoted all his small fortune to the revolutionary propaganda. Until Aug. 31, 1791, he was secretary of the Jacobin club; he entered the Bastille among the first of the storming party. He worked for the *Mercure de France*, collaborated with Ginguéné in the *Feuille villageoise*, and drew up for Talleyrand his *Adresse au peuple français*.

With the reign of Marat and Robespierre, however, his uncompromising Jacobinism grew critical, and with the fall of the Girondins his political life came to an end. But he could not restrain the tongue that had made him famous; he no more spared the Convention than he had spared the court. He was imprisoned for a short time, and released; but he had determined to prefer death to a repetition of confinement, and when he was again threatened with arrest he attempted suicide with pistol and with poniard, dictating to those who came to arrest him the well-known declaration: "*Moi, Sebastien-Roch-Nicolas Chamfort, déclare avoir voulu mourir en homme libre plutôt que d'être reconduit en esclave dans une maison d'arrêt*," which he signed in a firm hand and in his own blood. He lingered on until April 13, 1794 in charge of a gendarme. To the Abbé Sieyès Chamfort had given fortune in the title of a pamphlet ("*Qu'est-ce que le Tiers-État? Tout. Qu'a-t-il? Rien*"), and to Sieyès did Chamfort retail his supreme sarcasm, the famous "*Je m'en vais enfin de ce monde où il faut que le coeur se brise ou se bronze*." The maker of constitutions followed the dead wit to the grave.

The writings of Chamfort, which include comedies, political articles, literary criticisms, portraits, letters and verses, are colourless and uninteresting. His genius was in conversation. His *Maximes et Pensées* are, after those of La Rochefoucauld, the most brilliant and suggestive sayings of the 18th century. The aphorisms of Chamfort, less systematic and psychologically less important than those of La Rochefoucauld, are as significant in their violence and iconoclastic spirit of the period of storm and preparation that gave them birth as the *Réflexions* in their exquisite restraint and elaborate subtlety are characteristic of the tranquil elegance of their epoch; and they have the advantage in richness of colour, in picturesqueness of phrase, in passion, in audacity. Sainte-Beuve compares them to "well-minted coins that retain their value," and to keen arrows that *arrivent brusquement et sifflent encore*.

The *Oeuvres complètes de Nicolas Chamfort* appeared at Paris, 5 vols. (1824-25), selections one vol. (1852), with a biographical and critical preface by Arsène Houssaye and *Oeuvres choisies*, with a preface and notes by M. de Lescure (1879). See also Sainte-Beuve, *Causeries du Lundi*; M. Pellisson, *Chamfort, étude sur sa vie* (1895).

CHAMFRON or **CHANFRIN**. A horse's forehead, more particularly the piece of armour which covered the front of a barded horse.

CHAMIER, FREDERICK (1796-1870), English novelist, was the son of an Anglo-Indian official, and served in the navy from 1809 to 1856. Captain Chamier wrote several popular sea-stories, including *The Life of a Sailor* (1832), *Ben Brace* (1836), *The Arethusa* (1837), *Jack Adams* (1838), *Tom Bowling* (1841), and *Jack Malcolm's Log* (1846). He also edited and brought down to 1827 James's *Naval History* (1837).

CHAMILLART, MICHEL (1652-1721), French statesman, minister of Louis XIV. In 1690 he was made intendant of finances, and on Sept. 5, 1699, the king appointed him controller-general of finances, and on Jan. 7, 1700, minister of war. From the first Chamillart's position was a difficult one. The deficit amounted to more than 53 million livres, and the credit of the

state was almost exhausted. In Oct. 1706 he showed the king that the debts immediately due amounted to 288 millions, and that the deficit already foreseen for 1707 was 160 millions. In Oct. 1707 he saw with consternation that the revenue for 1708 was already entirely eaten up by anticipation, so that neither money nor credit remained for 1708. In these conditions Chamillart resigned his office of controller-general. Public opinion attributed to him the ruin of the country, though he had tried in 1700 to improve the condition of commerce by the creation of a council of commerce. As secretary of state for war he had to place in the field the army for the War of the Spanish Succession, and to reorganize it three times, after the great defeats of 1704, 1706 and 1708. With an empty treasury he succeeded only in part, and he frankly warned the king that the enemy would soon be able to dictate the terms of peace. He resigned office in 1709, and died on April 14, 1721.

See G. Esnault, *Michel Chamillart, contrôleur général et secrétaire d'état de la guerre, correspondance et papiers inédits* (1885); A. de Boislisle *Correspondance des contrôleurs généraux* (vol. ii., 1883); M. Langlois, *Louis XIV. et la cour. D'après trois témoins nouveaux: Bélière Beauvillier, Chamillart*. (1926).

CHAMINADE, CÉCILE, French composer, was born in Paris on Aug. 8, 1861. She studied in Paris, her musical talent being shown at the age of eight by the writing of some church music which attracted Bizet's attention; and at eighteen she came out in public as a pianist. Her own compositions, both songs (in large numbers) and instrumental pieces, are melodious and effective and have enjoyed great popularity.

CHAMISE (*Adenostoma fasciculatum*). A North American shrub of the rose family (Rosaceae), called also chamiso, found in the chaparral belt on foothills and mountain slopes in California, ranging up to 5,000 ft. altitude. It grows from 2 ft. to 10 ft. high, with shreddy brown bark; slender twiggy branches; resinous, narrow leaves in bundles or fascicles, and small white flowers in panicle clusters. Chamise is the most abundant and characteristic small shrub of the higher foothills west of the Sierra Nevada, where, between the lower foothills and the yellow pine belt, it often forms a distinct zone called chamisal. (See CHAPARRAL.)

CHAMISSO, ADELBERT VON (LOUIS CHARLES ADELAIDE DE) (1781-1838), German poet and botanist, was born at the château of Boncourt in Champagne, the ancestral seat of his family. Driven from France by the revolution, his parents settled in Berlin, where in 1796 young Chamisso obtained the post of page-in-waiting to the queen, and in 1798 entered a Prussian infantry regiment as ensign. In close collaboration with Varnhagen von Ense, he founded in 1803 the *Berliner Musenalmanach*, in which his first verses appeared. Although the enterprise was a failure, it brought him to the notice of literary celebrities. He left the army in 1808, and in 1810 joined the charmed circle of Mme. de Staël, following her in her exile to Coppet in Switzerland. In 1813 he wrote the prose narrative *Peter Schlemihl*, the man who sold his shadow. The most famous of all his works, it has been translated into most European languages (English by W. Howitt). In 1815 Chamisso was appointed botanist to the Russian ship "Rurik," which Otto von Kotzebue commanded on a scientific voyage round the world. He published his diary (*Tagebuch*) of this expedition in 1821. In 1818 he became custodian of the botanical gardens in Berlin. From 1829 he brought out the *Deutsche Musenalmanach*, in which his later poems were mainly published. He died on Aug. 21, 1838.

As a scientist Chamisso wrote *Bemerkungen und Ansichten, und Übersicht der nutzbarsten und schädlichsten Gewächse in Norddeutschland* (1829). His *Frauenliebe und -leben* (1830), a cycle of lyrical poems, which was set to music by Schumann, were particularly famous. Noteworthy are also *Schloss Boncourt* and *Salas y Gomez*. In the lyrical expression of the domestic emotions he displays a fine felicity, and he knew how to treat with true feeling a tale of love or vengeance. *Die Löwenbraut* may be taken as a sample of his weird and powerful simplicity; and *Vergeltung* is remarkable for a pitiless precision of treatment.

The first collected edition of Chamisso's works was edited by J. E. Hitzig (6 vols., 1836; 6th ed., 1874); there are also excellent editions

by M. Koch (1883) and O. F. Walzel (1892). On Chamisso's life see J. E. Hitzig, "Leben und Briefe von Adelbert von Chamisso" (in the *Gesammelte Werke*); K. Fulda, *Chamisso und seine Zeit* (1881); G. Hofmeister, *Adelbert von Chamisso* (1884); and E. du Bois-Reymond, *Adelbert von Chamisso als Naturforscher* (1889).

CHAMKANNI, a small tribe of Ghorla Khel Pathans in Kurram, Afghanistan.

CHAMOIS, the Franco-Swiss name of a hollow-horned ruminant known in German as *Gemse* or *Gemsbok*; scientifically, *Rupicapra tragus*. It is the only species in the genus, though every European range possesses a local race. It is the type of the sub-family *Rupicaprinae*, intermediate between the antelopes and goats (see ANTELOPE). About the size of a roebuck, with a short tail, it is distinguished by the vertical, backwardly-directed horns in both sexes, though these are larger in the male. Though differing in the shade of their hair, all the various races have black and white face markings and a black tail and dorsal stripe. The alpine race is chestnut-brown in summer, lighter and greyer in winter. A thick under-fur is developed in the cold weather. Chamois live in small herds, but the old males only join these during the rutting season (October), when they engage in fierce contests with each other. The period of gestation is 20 weeks, and the usual number of offspring is one. In summer, the animals ascend to the snow-line, being only exceeded in the loftiness of their haunts by the ibex. In winter they descend to wooded regions. Chamois-hunting is a favourite sport of the Swiss and Tirolese, and of amateurs from all countries. As a result of this, the chamois has become rare in many of its old haunts, but it is now preserved in the Swiss National Park in the Engadine. Exceedingly wary and astonishingly agile, the animal is very difficult of approach. It feeds in summer on mountain-herbs and flowers, in winter on the young shoots of the pine. The skin is very soft and is made into the original "shammy" leather, though this is now also made from the skins of other animals. The flesh is prized as venison. During the present century the chamois has been successfully introduced from Austria into New Zealand.

NEW YORK ZOOLOGICAL SOCIETY

CHAMOIS, A GOAT ANTELOPE

CHAMOMILE or **CAMOMILE FLOWERS**, the *flores anthemidis* of the British Pharmacopoeia, the flower-heads of *Anthemis nobilis* (family Compositae), a herb indigenous to western Europe. It is cultivated for medicinal purposes in Surrey, at several places in Saxony, and in France and Belgium—that grown in England being much more valuable than any of the foreign chamomiles. In the wild plant the florets of the ray are ligulate and white, and contain pistils only, those of the disk being tubular and yellow; but under cultivation the whole of the florets tend to become ligulate and white, in which state the flower-heads are said to be double. The flower-heads have a warm aromatic odour, which is characteristic of the entire plant, and a very bitter taste. In addition to a bitter extractive principle, they yield a volatile liquid, which on its first extraction is of a pale blue colour, but becomes a yellowish brown on exposure to light. It has the characteristic odour of the flowers, and consists of a mixture of butyl and amyl angelates and valerates. Chamomile is used in medicine in the form of its volatile oil.

Wild chamomile is *Matricaria Chamomilla*, a weed common in waste and cultivated ground especially in the southern counties of England. It has somewhat the appearance of true chamomile, but a fainter scent.

CHAMONIX-MONT-BLANC, a well-known Alpine tourist resort, in the department of Haute-Savoie, south-east France. Pop. (1926) 1,360. The valley of Chamonix runs from north-east to south-west, and is watered by the Arve, which rises in the Mer de Glace. On the south-east towers the snowclad chain of Mont Blanc, and on the north-west the rugged chain of the Brévent

and of the Aiguilles Rouges. Chamonix (3,416 ft.) is the best starting-point for the exploration of the glaciers of the Mont Blanc chain, as well as for the ascent of Mont Blanc itself. It is connected with Geneva by a railway (55 miles).

The valley is first heard of about 1091, when it was granted by the count of the Genevois to the great Benedictine house of St. Michel de la Cluse, near Turin, which, by the early 13th century, had established a priory there. In 1786 the inhabitants bought their freedom from the canons of Sallanches, to whom the priory had been transferred in 1519. In 1530 the count of the Genevois granted the privilege of holding two fairs a year. The tourist industry dates from the 18th century, but its development is modern. The first party to publish (1744) an account of their visit was that of Dr. R. Pococke, Mr. W. Windham and other Englishmen who visited the Mer de Glace in 1741.

CHAMPAGNE, an ancient province of France, bounded north by Liège and Luxemburg; east by Lorraine; south by Burgundy; and west by Picardy and Isle de France. It now forms the departments of Ardennes, Marne, Aube and Haute Marne, with part of Aisne, Seine-et-Marne, Yonne and Meuse. Its name is derived from the immense plains near Reims, Châlons and Troyes. The province was constituted by joining to the countship of Champagne the ecclesiastical duchies of Reims and Langres and the ecclesiastical countship of Châlons. From 1152 to 1234 the countship of Champagne reckoned among its dependencies the countship of Blois and Chartres, of which Touraine was a fief, the countship of Sancerre and various scattered fiefs in the Bourbonnais and in Burgundy. The countships of Troyes and Meaux were also absorbed into this amalgamation of territories which became known as the "countship of Champagne and Brie." (See TROYES.)

About 1020, Odo I. (Odo II., count of Blois, *q.v.*) became count of Champagne. In 1037 he was succeeded by his younger son, Stephen II. About 1050, Odo II., son of Stephen II., became count and was followed about 1063 by Theobald I., count of Blois and Meaux, eldest son of Odo I. In 1077 he seized the countships of Vitry and Bar-sur-Aube, left vacant by Simon of Valois, who had retired to a monastery. In 1089 Odo III., second son of Theobald II., became count, and was succeeded about 1093 by his younger brother, Hugh, who became a templar in 1125, and gave up the countship to his suzerain, the count of Blois. In 1125 the countship of Champagne passed to Theobald II. the Great, already count of Blois and Meaux, and one of the most powerful French barons of his time. After him the countship of Blois became the appanage of a younger branch of his house. In 1152 Henry the Liberal, eldest son of Theobald II., became count of Champagne; he married Mary, daughter of Louis VII. of France, and went to the crusade in 1178. He was taken prisoner by the Turks, recovered his liberty through the good offices of the emperor of the East, and died a few days after his return to Champagne. In 1181 his eldest son, Henry II., succeeded him under the tutelage of Mary of France. In 1190, he went to the Holy Land and became king of Jerusalem in 1192 through his marriage with Isabelle, widow of the marquis of Montferrat. He died in 1197 in his town of Acre. In 1197 Theobald III., younger son of Henry I., became count, and was succeeded in 1201 by Theobald IV., "le Chansonnier," the son of Theobald III. and Blanche of Navarre. His reign was singularly eventful. In 1226 he followed King Louis VII. to the siege of Avignon, and after the death of that monarch played a prominent part during the reign of St. Louis. He became king of Navarre in 1234 by the death of his maternal uncle, Sancho VII., but as a result of the onerous treaty which he concluded in that year with the queen of Cyprus he was compelled to cede to the king, in return for a large sum of money, the overlordship of the countships of Blois, Chartres and Sancerre, and the viscounty of Châteaudun. In 1239-40 he took part in an expedition to the Holy Land, and died on July 14, 1254 at Pampeluna. The witty and courtly songs he composed place him in the front rank of the poets of that class, in which he showed somewhat more originality than his rivals. In 1254 Theobald V., his eldest son and, like him, king of Navarre, became count of Champagne. He married Isabelle of France, daughter of St. Louis, and followed his father-in-

law to Tunis to the crusade, dying on his return. In 1270 he was succeeded by Henry III. the Fat, king of Navarre. Henry was succeeded in 1274 by his only daughter, Joan of Navarre, who married in 1284 the heir-presumptive to the throne of France, Philip the Fair. She became queen of France in 1285, and died on April 4, 1305, when her eldest son by King Philip, Louis Hutin, became count of Champagne, which was attached to the French crown on his accession as king in 1314.

The celebrated fairs of Champagne, which flourished in the 12th and 13th centuries, were attended by merchants from all parts of civilized Europe. They were six in number; two at Troyes, two at Provins, one at Lagny-sur-Marne and one at Bar-sur-Aube. They formed a kind of continuous market, divided into six periods, and passed in turn from Lagny to Bar, from Bar to Provins, from Provins to Troyes, from Troyes to Provins and from Provins to Troyes, to complete the year. It was, in fact, a perpetual fair, which had at once unity and variety, offering to the different parts of the countship the means of selling successively the special productions of their soil or their industry, and of procuring in exchange riches and comforts. These fairs had special legislation; and special magistrates, called "masters of the fairs," had control of the police. For the wine see CHAMPAGNE WINES.

CHAMPAGNE, BATTLES IN. This was the name commonly if vaguely given to a number of long drawn-out offensives on the western front in the World War. Among the principal ones the first was the French attack east of Reims on Sept. 25, 1915, an outline of which will be found in the article on the WORLD WAR. The simultaneous British offensive at Loos (*q.v.*), north of Lens, was intended to be subsidiary to this, as was also a lesser French offensive south of Lens. Still more important in scale and design was the French offensive west of Reims in April 1917, frequently called the Nivelle offensive. The failure of this ambitious plan for a swift and decisive break-through culminated in mutinies which seriously endangered the fighting efficiency of the French army; only after some months was its morale restored by the sympathetic and prudent leadership of Gen. Pétain.

The Autumn Offensive, 1915.—During the summer of 1915 local attacks had been carried out in the Vosges and Argonne, while preparations were being made for operations on a large scale in Champagne and for a powerful diversion in Artois. The objective in Champagne was the rupture of the German front from Bazancourt to Challerange, so as to outflank their positions to the north of Reims and in the Argonne. It was hoped thus to roll up the eastern part of the German front. Under the direction of Gen. de Castelnau the attack was made by the II. Army (Pétain) with the right of the IV. Army (de Langle de Cary) and the left of the III. Army (Humbert), a total of 35 divisions, or at least 420 battalions, against the German III. Army (Einem), which had at first only 70 battalions, later reinforced to 192. However, the secret of the future offensive was so badly kept that as early as Aug. 15 a German order had foreseen it. The artillery preparation began on Sept. 22, and at 9:15 A.M. on Sept. 25 the assault was launched and penetrated along almost the whole front to a depth of from 2,000 to 4,000 yd. reaching even the second position in one sector. But the German command, foreshadowing the method of elastic defence which became famous in 1918, had withdrawn the guns and allowed the lightly held first position to act as a shock-absorber. Progress then became slow and costly.

On Sept. 28 and 29 a part of the second position was carried to the west of Le Mesnil and Navarin farm and a break through was made in a narrow section, but the Germans quickly closed the gap. The French cavalry corps had to retire on the 28th to the rear lines without having been engaged. On the 30th a general order announced the end of the operations with the capture of 25,000 prisoners and 150 guns. Nevertheless, abortive attacks continued until Oct. 8. The Champagne offensive cost the French 80,000 killed and missing and 100,000 sick and wounded. The

results were not in due proportion to this sacrifice, mainly because the attacks had lacked the characteristics of surprise, rapidity and continuity, and had been continued too long.

French Offensive on the Aisne, 1917.—The strategical and political controversies which preceded the opening of the allies' offensive campaign of 1917 are dealt with in the article on the WORLD WAR. On the Aisne, the French offensive was to extend from Vailly to Reims. Gen. Pétain, consulted by Nivelle on the proposed action, criticized it freely and refused the leadership, which was entrusted to Gen. Michélet. The V. Army (Masel), which had held this front since 1914, closed on its right to make room for the VI. Army (Mangin), while the X. Army (Duchêne) was in reserve. Nivelle had decided on a rapid attack which aimed at carrying the positions and all the artillery zone at the first assault. This resembled the method twice employed at Verdun. No one raised any serious objection, but Nivelle foretold an immediate exploitation of the success by the X. Army, which should carry it as far to the north as possible. Michélet estimated that the whole operation might be accomplished the first day, or at latest on the morning of the second. He indicated as objectives the foot of the heights to the north of the Ailette, the plain of Laon, and the east of Brimont fort. The only objection was raised by Mangin, who called attention particularly to the importance of good atmospheric conditions. This did not modify Nivelle's wishes, and Michélet exaggerated them by giving such detailed orders that no initiative was left to the army commanders.

The preparation for the offensive was in full swing when the German retreat to the Hindenburg line began. Nivelle's plan had to be modified, the Oise-Somme attack lost all interest and that upon the Aisne alone remained. Mangin called attention to the fact that the retirement had left a right-angled salient about the Laffaux mill and that an attack to the north would be able to take the Chemin des Dames in reverse. The commander-in-chief admitted this and two divisions were devoted to this local operation. In addition it was decided that the IV. Army (Anthoine) should attack the Massif de Moronvilliers, east of Reims. On top of this a political incident led to the retirement of Gen. Lyautey, Minister of War. He was replaced by M. Painlevé, who was hostile to Nivelle's plans. This weakened the confidence of the commander-in-chief's subordinates, and Nivelle went so far as to offer his resignation, which was refused.

The British share of the offensive began on April 9 before Arras. The operations on the Aisne should have begun on April 12, but were put off, first to the 14th, then to the 16th on account of the bad weather. The front of attack measured 25 miles. The VI. Army (Mangin) operated on nearly 100 m. with 17 divisions plus a cavalry division and a territorial division, 1,669 guns, of which 823 were heavy or large; the V. Army (Masel) had a nearly similar strength but with 1,967 guns (1,107 heavy or large). The artillery preparation commenced on April 5 and continued until the 15th on account of the postponement of the attack. It sufficed, but its duration permitted the Germans to make suitable dispositions and there was no surprise. On the morning of April 16 the Allies carried the first German line on the whole front. The right and centre of the V. Army gained a depth of 1½ to 2 m., but on the left a tank attack, badly conducted, failed with heavy losses and the infantry rapidly came to a standstill on the plateau of Craonne. The right of the VI. Army took the position of Hurtebise and pushed as far as the Ailette, but further east the fighting was desperate and the gain insignificant. In the centre progress was more satisfactory, though difficult. On the left, the commencement was good, but the advance quickly became wild, and at certain points it was practically negligible.

To sum up, although some good results had been obtained the hoped for success had not been won. Badly informed, Nivelle imagined that on the 17th he ought to stop the northern advance of the VI. Army and push the V. Army towards the north-east. This order became delayed, so on the 17th Mangin continued his attacks, notably in the centre, where he made a marked advance on the front Braye en Laonnois-Ostel. The situation having changed Mangin ordered a vigorous pursuit, in spite of the

stopping order. Slow progress was made towards the Chemin des Dames. On the same date (17th) the IV. Army (Anthoine) had made good progress in the Massif de Moronvilliers. Between the 16th and 20th the French captured 21,000 prisoners and 183 guns, and advanced some 5m. on the Aisne front of 7½m. width. Of the 52 German divisions in reserve available on April 1 only 16 remained unengaged. This result was less than had been hoped, but it was nevertheless appreciable and certainly superior to those of preceding offensives.

Unhappily the morale behind the front line was rapidly declining, the losses being greatly exaggerated. Nevertheless, Nivelles continued his operations. The X. Army took up its position on the plateau de Craonne, between the V. and VI. Armies, but on April 27 Michelet wrote that he had not strength enough for a general offensive toward the north and that he proposed to limit himself to local attacks. Nivelles accepted this solution. These operations, rendered more difficult by the unfortunate intervention of politicians, produced very poor results. The IV. Army on May 4 captured the Craonne plateau, and Laffaux mill was carried on the 5th. For several months, however, the X. Army could only with difficulty hold on to the crest of the Chemin des Dames. The French had lost from April 16 to 25, 15,000 dead, 60,000 wounded and 20,500 missing. Nevertheless, all the 52 reserve German divisions of April 1 had been employed by May 4, and quiet sectors had been robbed to reinforce the Aisne line. Up to May 25, 99 German divisions had already appeared on the front attacked, of which 11 had appeared twice. This expenditure was triple that before Verdun in ten months.

(B. E. P.; C. M. E. M.)

CHAMPAGNE WINES. Champagne is the name of one of the old French provinces. It is also the name given to the wine made from grapes grown in the former Champagne province on some hill-side vineyards within a comparatively small and very irregular triangle formed by an imaginary line drawn from Reims to Epernay, then to Châlons-sur-Marne and back to Reims.

The vineyards of Champagne produce wines which possess, in spite of a general resemblance, some marked characteristics of their own, and the first thing which the champagne shipper must do is to blend together the wines from different vineyards in such a proportion and in such a way that the best features of each wine will show to advantage. Hence, unlike claret and burgundy, champagne is not sold under the name of any parish, estate or château, but under the name of the shipper who is responsible for the blending of the wines of many different vineyards.

The second and more striking difference between champagne and claret or burgundy is that the wine instead of being bottled when it has ceased completely to ferment, is bottled at a much earlier stage, and finishes fermenting in bottle. Fermentation transforms grape-sugar into alcohol and carbonic acid gas; so long as the wine is kept in cask, the carbonic acid gas escapes into the air; whereas, with champagne, it remains in the wine, which it renders sparkling by trying to escape as soon as the cork has been removed.

Fermentation, and a number of attendant chemical reactions which continue within the bottle after the new champagne wine has been bottled, are responsible not only for alcohol and carbonic acid gas, which are welcome, but also for some sediment which fouls the look of the wine. The shipper gets this sediment out of the bottle without losing wine or gas. He does it by collecting all the sediment upon the inside face of the cork, a feat which requires much time and skill; the wine in the neck of each bottle is frozen solid, the cork is removed, and, at the same time, a lump of very dirty ice is removed, which is really all the sediment frozen hard in a few drops of wine.

Champagne is not only the most fascinating of wines, but one of the most wholesome. Its carbonic acid gas is self-generated; it forms part and parcel of the wine itself and renders it exceedingly valuable in all cases of digestive troubles.

No wine is entitled to the name of champagne which is not made from grapes grown within a strictly limited area within the ancient province of Champagne. Champagne, when good, is certainly better than any other sparkling wine can ever hope

to be; it requires greater care, is made with better grapes, of blends of finer and more suitable wines, and is also matured in bottle somewhat longer. There are many sparkling wines, made in a similar way to champagne, which are light, sweet, wholesome and palatable, and are, moreover, much cheaper. There are others, however, which are made of any cheap ordinary wine filled up with artificial gas, sugar and some flavouring essence or other, such, for instance, as elderberry flower essence, which gives a wine a so-called "muscatel" flavour.

CHAMPAGNY, JEAN BAPTISTE NOMPÈRE DE, DUC DE CADORE (1756–1834), French politician, was born at Roanne on Aug. 4, 1756, and entered the navy in 1774. He fought through the war in America and resigned in 1787. Elected deputy by the noblesse of Forez to the states-general in 1789, he went over to the third estate on June 21 and collaborated in the work of the Constituent Assembly, especially occupying himself with the reorganization of the navy. He remained in private life from 1791–99, when Napoleon named him member of the council of state. From July 1801 to Aug. 1804 he was ambassador of France at Vienna and directed the incessant negotiations between the two courts. As minister of the interior (1804–7) he proved an administrator of the first order. In Aug. 1807 he succeeded Talleyrand as minister for foreign affairs. He directed the annexation of the Papal states in April 1808, worked to secure the abdication of Charles IV. of Spain in May 1808, negotiated the peace of Vienna (1809) and the marriage of Napoleon. In April 1811 a quarrel with the emperor led to his retirement. In 1814, after the abdication, the empress sent him on a fruitless mission to the emperor of Austria. Then he went over to the Bourbons. During the Hundred Days he again joined Napoleon. This led to his exclusion by Louis XVIII., but in 1819 he recovered his dignity of peer. He died in Paris on July 3, 1834. Three of his sons achieved distinction. François (1804–1882) wrote a history of the Roman empire, in three parts—(1) *Les Césars* (1841–43, 4 vols.); (2) *Les Antonins* (1863, 3 vols.); (3) *Les Césars du III siècle* (1870, 3 vols.). Napoleon (1806–1872) published a *Traité de la police municipale* in 4 vols. (1844–61), and was a deputy in the Corps Législatif from 1852–70. Jérôme Paul (1809–86) was also deputy in the Corps Législatif from 1853–70, and was made honorary chamberlain in 1859. He worked on the official publication of the correspondence of Napoleon I.

CHAMPAIGN, a city of Champaign county, Illinois, U.S.A., in a rich agricultural region, 125m. S. by W. of Chicago. It is on Federal highway 45; is served by the Big Four, the Illinois Central, the Wabash and the Illinois Traction railways; and has a commercial air-port. The population in 1930 was 20,348. Champaign and Urbana, adjoining it on the east, form practically one city, with common public utilities and civic enterprises. The only separate institutions are the post offices and the city governments. Champaign has the greater part of the business and industrial activities, which include railroad repair shops and manufactures of structural iron and steel, heavy castings, tools, refrigerators and textiles. Its total factory product in 1925 was valued at \$3,742,782. The campus of the University of Illinois (*q.v.*) lies partly in Champaign. At Rantoul, 14m. N. (population in 1920, 1,551) is Chanute Field, a flying field of the Army Air Corps. Champaign was founded in 1855 and incorporated as a city in 1860.

CHAMPAIGNE, PHILIPPE DE (1602–1674), Belgian painter of the French school, was born at Brussels of a poor family. He was a pupil of J. Fouquières; and, going to Paris in 1621, was employed by N. Du Chesne to paint with Nicholas Poussin in the palace of the Luxembourg. His best works are to be found at Vincennes, and in the church of the Carmelites at Paris, where is his celebrated Crucifix, a signal perspective success, on one of the vaultings. After the death of Du Chesne, Philippe became first painter to the Queen of France, and ulti-

mately rector of the Academy of Paris. As his age advanced and his health failed, he retired to Port Royal, where he had a daughter cloistered as a nun, of whom (along with Catherine Agnès Arnauld) he painted a picture, now in the Louvre, highly remarkable for its solid unaffected truth. This, indeed, is the general character of his work,—grave reality, without special elevation or depth of character, or charm of warm or stately colour. He produced an immense number of paintings, religious and other subjects as well as portraits, dispersed over various parts of France, and now over the galleries of Europe. Philippe died on Aug. 12, 1674.

CHAMPARAN, a district of British India, in the Tirhut division of Behar and Orissa, occupying the north-west corner of Bihar, between the two rivers Gandak and Baghmati and the Nepal hills. It has an area of 3,531 square m., and a population (1921) of 1,940,841. The district is a vast level, except in the north and north-west, where outliers of the Himalayas, known as the Sumeswar and Dun ranges, extend for some 15 miles into the alluvial plain. The former hills rise to a height of 2,884 feet at Fort Sumeswar; at their eastern extremity is the Bhikna Thori pass into Nepal. The two ranges, which have an area of about 364 square miles, contain stretches of forest and jungle. Elsewhere the land is closely cultivated, and teems with an active agricultural population. The principal rivers are the Gandak, navigable all the year round, the Burh Gandak, Leibagi, Dhanauti and Baghmati. Old beds of rivers intersect Champaran, and one of these forms a chain of lakes which occupies an area of 139 square m. in the centre of the district.

Champaran was the chief seat of indigo planting in Bihar before the decline of that industry. There are about 40 saltpetre refineries. The district suffered severely from drought in 1866 and 1874, and again in 1897. As a protection against crop failures the Tribini and Dhaka canals have been constructed. The former derives its supply from the Gandak river at Tribini immediately below the Nepal frontier and irrigates a tract in the north of the district. The latter is a minor work taking off from the river Lalbukaya and irrigating 13,000 acres in the east. The district is traversed by the Bengal and North-Western railway. A considerable trade is conducted with Nepal.

The administrative headquarters are at Motihari (pop. 13,828); and Bettia (pop. 24,291) a subdivisional town, is the headquarters of the large estate known as the Bettia Raj and of a Roman Catholic mission founded in 1748; Sugauli, a small military station, was the scene of a massacre during the Mutiny; it was here that the Nepalese treaty of 1815 was signed. Three of the sandstone pillars with pillar edicts which Asoka erected to mark the stages of his journey into Nepal are found in this district at the following places: Lauriya Nandangarh, Lauriya Araraj and Rampurisa.

CHAMPEAUX, WILLIAM OF (c. 1070–1121), French Scholastic, was born at Champeaux near Melun. After studying under Anselm of Laon and Roscelin, he taught in the cathedral school of Paris, where he opposed Roscelin and had Abélard as a pupil. In 1103 he became a canon of Notre Dame, but in 1108 retired to the abbey of St. Victor, where he resumed his lectures. He afterwards became bishop of Châlons-sur-Marne, and took part in the dispute concerning investitures as a supporter of Calixtus II. His theological works are the *De Eucharistia* (inserted by Jean Mabillon in his edition of the works of St. Bernard), and the *De Origine Animæ* (in E. Martène's *Anecd. nov.* 1717 vol. v.) in which he upholds the theory of Creatianism (that a soul is specially created for each human being). In his *De Generibus et Speciebus* (printed by V. Cousin in *Ouvrages inédits d'Abélard*, 1836), William shows himself an excessive realist by declaring that the universal is the whole reality of the individual, but in his later *Sententiae* (extracts published in G. Lefèvre: *Les variations de G. de Champeaux*, Lille, 1898), he adopts a moderate realism.

For his views and controversies with Abélard see SCHOLASTICISM and ABÉLARD.

See Lefèvre: *op. cit.*; Hurtault: "Théologie de G. de Champeaux" in *Rev. de sc. eccl. et sc. cath.* 1908–09; E. Michaud: *G. de Champeaux et ses écoles de Paris au XII^e siècle* (2nd ed. Paris, 1868), and Überweg: *Grundriss der Gesch. der Phil.* teil ii. (Berlin, 1928).

CHAMPERICO, a Pacific port of Guatemala, Central America, 28m. by the International Railways of Central America from Retalhuleu (*q.v.*). Population, 1,500. Exports, chiefly coffee. The harbour is an open roadstead, ships being served by lighter.

CHAMPERTY, in common law, a bargain between a plaintiff or defendant in a cause and another person, to divide the land (*campum partiri*) or other subject-matter of the action in the event of success, in consideration of that person carrying on or defending the suit partly or wholly at his own expense. It is a misdemeanour punishable by fine or imprisonment. It differs only from maintenance (*q.v.*), in that the recompense for the service which has been given is always part of the matter in action, or some profit growing out of it. Such an agreement is illegal and void. It is not, however, illegal to charge the subject-matter of an action in order to obtain the means of prosecuting or defending it.

See *Fifth Report of the Criminal Law Commissioners*, pp. 34–39.

CHAMPION, in the judicial combats of the Middle Ages the substitute for a party to the suit disabled from bearing arms or specially exempt from the duty to do so (see WAGER). Hence the word has come to be applied to any one who "champions," or contends on behalf of, any person or cause. In the laws of the Lombards (lib. ii. tit. 56, sections 38, 39), those who by reason of youth, age or infirmity could not bear arms were allowed to nominate champions, and the same provision was made in the case of women (lib. i. tit. 3, section 6, tit. 16, section 2). This was practically the rule laid down in all subsequent legislation on the subject. The clergy, as individuals or corporations, were represented by champions; in the case of bishops and abbots this function was part of the duties of the *advocatus* (see ADVOCATE). Du Cange gives instances of mercenary champions who were regarded as "infamous persons," and sometimes, in case of defeat, were condemned to lose hand or foot. Sometimes championships were "serjeanties"; i.e., rendered service to lords, churches or cities in consideration of the grant of certain fiefs, or annual money payments.

The office of "King's champion" (*campio regis*) is peculiar to England. His function was to ride, clad in complete armour, on his right the high constable, on his left the earl marshal, into Westminster Hall during the coronation banquet, and challenge to single combat anyone who should dispute the King's right to reign. The challenge was thrice repeated by the herald, at the entrance to the hall, in the centre, and at the foot of the dais. On picking up his gauntlet for the third time, the champion was pledged by the King in a gilt-covered cup, which was then presented to him as his fee by the King. If he had had occasion to fight, and had been victorious, his fee would have been the armour he wore and the horse he rode, the second best in the royal stables; but no such occasion ever arose. This ceremonial was last performed at the coronation of George IV. The office of King's champion is of great antiquity, but of the actual exercise of the office the earliest record dates from the coronation of Richard II. On this occasion the champion, Sir John Dymoke, appeared at the door of the Abbey immediately after the coronation mass, but was peremptorily told to go away and return later; moreover, in his bill presented to the court of claims, he stated that the champion was to ride in the procession before the service, and make his challenge to all the world. This seems to show that the ceremony, as might be expected, was originally performed before the King's coronation, when it would have had some significance. The manor of Scrivelsby is held in grand serjeanty by the service of acting as the king's champion, although the service has become obsolete with the coronation banquet; it is still held by a Dymoke.

See Du Cange, *Glossarium*, s.v. "Campio"; L. G. Wickham Legg, *English Coronation Records* (1901); J. H. T. Perkins, *The Coronation Book* (1902).

CHAMPIONNET, JEAN ÉTIENNE (1762–1800), French general, born at Valence, enlisted in the army at an early age and served in the great siege of Gibraltar. In May 1793 he was charged with the suppression of the disturbances in the Jura, which he quelled without bloodshed. Under Pichegru he took part in the Rhine campaign of that year as a brigade commander and

at Weissenburg and in the Palatinate won the warm commendation of Hoche. He commanded the left wing of the French armies on the Rhine, between Neuwied and Düsseldorf, and took part in the expeditions to the Lahn and the Main. In 1798 Championnet was named commander-in-chief of the "army of Rome," which was protecting the infant Roman republic against the Neapolitan court and the British fleet. The Austrian general Mack had a tenfold superiority in numbers, but Championnet captured Naples itself and there set up the Parthenopean republic. But his intense earnestness and intolerance of opposition soon embroiled him with the civilians, and the general was recalled in disgrace. The following year, however, saw him again in the field as commander-in-chief of the "army of the Alps." The campaign which followed was uniformly unsuccessful, and, worn out by the unequal struggle, Championnet died at Antibes, on Jan. 9, 1800.

See A.R.C. de St. Albin, *Championnet, ou les Campagnes de Hollande, de Rome et de Naples* (1860); M. Faure, *Souvenirs du Général Championnet* (1904).

CHAMPLAIN, SAMUEL DE (1567-1635), French explorer, colonial pioneer and first governor of French Canada, was born at Brouage on the Bay of Biscay. His father was a sea captain, and the boy was early skilled in seamanship and navigation. He entered the army of Henry IV., and served in Brittany. When the army of the League was disbanded he accompanied his uncle, who had charge of the ships in which the Spanish allies were conveyed home, and on reaching Cadiz secured (1599) the command of one of the vessels about to make an expedition to the West Indies. He was gone over two years, visiting all the principal ports and pushing inland from Vera Cruz to the city of Mexico. The ms. account of his adventures, *Bref Discours des Choses plus remarquables que Samuel Champlain de Brouage a recognees aux Indes Occidentales*, is in the library at Dieppe. It was not published in French until 1870, although an English translation was printed by the Hakluyt Society in 1859. It contains a suggestion of a Panama canal, "by which the voyage to the south sea would be shortened by more than 1,500 leagues." In 1603 Champlain made his first voyage to Canada, being sent out by Aymar de Clermont, on whom the king had bestowed a patent. Champlain at once established friendly relations with the Indians and explored the St. Lawrence to the rapids above Montreal. On his return he published *Des sauvages, ou voyage de Samuel Champlain de Brouage fait en la France Nouvelle*. During his absence de Clermont had died, and his privileges and fur trade monopolies were conferred upon Pierre de Guast, sieur de Monts (1560-1611). With him, in 1604, Champlain was engaged in exploring the coast as far south as Cape Cod, in seeking a site for a new settlement, and in making surveys and charts. They first settled on an island near the mouth of the St. Croix river, and then at Port Royal—now Annapolis, Nova Scotia.

Meanwhile the Basques and Bretons got de Monts' patent revoked, and Champlain returned to Europe. When, however, in modified form, the patent was re-granted to his patron, Champlain induced him to abandon Acadia and establish a settlement on the St. Lawrence. Champlain was placed in command of one of the two vessels sent out. He was to explore and colonize, while the other vessel traded, to pay for the expedition. Champlain fixed on the site of Quebec and founded the first white settlement there in July 1608, giving it its present name. In the spring he joined a war party of Algonquins and Hurons, discovered the great lake that bears his name, and, near the present Ticonderoga, took part in the victory which they obtained over the Iroquois. The Iroquois naturally turned first to the Dutch and then to the English for allies. Champlain then returned to France, but in 1611 was back in Canada, and established a trading post at Mont Royal. He was subsequently appointed lieutenant-general in New France.

In 1613 Champlain again crossed the Atlantic and endeavoured to confirm Nicolas de Vignau's alleged discovery of a short route to the ocean by the Ottawa river, a great lake at its source, and another river flowing north therefrom. That year he got as far as Allumette Island in the Ottawa, but two years later, with a "Great War Party" of Indians, he crossed Lake Nipissing and the eastern

ends of Lakes Huron and Ontario, and attacked an Onondaga fortified town a few miles south of Lake Oneida. This was the end of his wanderings. He now devoted himself to the growth and strengthening of Quebec. Every year he went to France with this end in view. He was one of the 100 associates of the Company of New France, created by Richelieu to reform abuses and take over all his country's interests in the new world. But in 1629 Quebec was forced to surrender to the English. Champlain was taken to England a prisoner, but when Canada was restored to the French he returned (1633) to his post, where he died. He had married in 1610, Hélène Boullé, then but 12 years old. She did not leave France for Canada, however, until ten years later. After his death she became a nun.

Champlain's works in six vols. were published under the patronage of the University of Laval in 1870. There is a careful trans. of *Champlain's Voyages*, by A. N. and E. G. Bourne (1906) in the "Trailmaker" series ed. by Prof. J. B. McMaster. See F. Parkman, *Pioneers of France in the New World* (1865); J. Winsor, *Cartier to Frontenac* (1894); G. Gravier, *Vie de S. Champlain* (1900); N. E. Dionne, *Champlain* (1905); R. Flinly, *S. Champlain* (Toronto, 1924).

CHAMPLAIN, LAKE. This lake is chiefly in the United States, between the States of New York and Vermont, but extends about 6m. into the Province of Quebec, Canada. It is about 125m. long, covers an area of about 600sq.m., varies in width from $\frac{1}{2}$ m. to 12m. and in depth from 100ft. to a maximum of about 400 feet. It drains into the St. Lawrence through the Richelieu river. Lake Champlain receives the waters of Lake George through a small stream containing rapids and falls. It receives the drainage from many other streams, all of them small. The most important ports on the lake are Burlington, Vt., Rouses Point, Plattsburg and Port Henry, New York. Plattsburg Barracks, a beautiful army post, is located on its shores at the city of the same name. It was at this post that the first experiment in training young men for the citizens army was tried out by Gen. Leonard Wood in 1915. The experience here gained was of great value during the World War when speed and efficiency were so essential. Since the World War, many young men of New York and other nearby States have been trained here in the Citizens Military Training Camps and in the Reserve Officers Training Corps.

Lake Champlain is a link in the international water line of communication between the Hudson river and the lower St. Lawrence. The total commerce passing the narrows of the lower end of the lake in 1926 was 115,000 tons. The through traffic consists principally of southbound lumber and pulp-wood and northbound coal. Local traffic is comparatively unimportant. The route from the St. Lawrence south is via the Richelieu river, with the St. Ours lock and dam in its lower course and the Chambly canal in its upper reach. This canal has 9 locks with total lift of 74 feet. The locks have the following dimensions: length, 118ft. (110ft. available); width, 22 $\frac{1}{2}$ ft.; depth on sills, 7ft. (reduced at low water to 6 $\frac{1}{2}$ ft.). The width of the canal is 36ft. at the bottom and 60ft. at the water surface. The "Champlain canal" connects Lake Champlain, at Whitehall, with the Hudson river at Waterford, New York. There are 12 locks with total lockage of 182 feet. The summit level is at elevation 140 and is supplied with water from the headwaters of the Hudson.

With the Green mountains on the east and the Adirondacks on the west, the scenery is rugged and beautiful. Many islands dot the northern portion of the lake. It was discovered in 1609 by the French explorer and soldier Samuel de Champlain, from whom the lake takes its name. During the early period of settlement of the North American continent Lake Champlain was the gateway between French Canada and the English colonies. It played an important part in all the wars in which the people to the north and south of it were on opposite sides. It is rich in the history and traditions of these early days. Champlain, with an expedition of about 80 friendly Montagues Indians, defeated the Iroquois on its shores in 1609. Thus began the long struggle between the French and the Five Nations.

In 1731 the French built a fort at Crown Point and in 1755 another at Ticonderoga; both were important strategic points in the French and Indian War as well as in the American Revolution. They controlled the easiest and most natural route between

Canada and New York. During the Seven Years' War (French and Indian) English and colonial expeditions twice failed to capture Crown Point. It was finally occupied by Amherst in 1759. Early in the American Revolution it was captured by a detachment of Ethan Allen's Green Mountain Boys. Ft. Ticonderoga was the scene of the severe repulse administered to Gen. Abercrombie by Gen. Montcalm in 1758. Later on it was captured by Amherst. At the beginning of the Revolution it was captured in a surprise attack by Capt. Ethan Allen. When asked by the British commander, Capt. La Place, by what authority the surrender of the fort was demanded, Capt. Allen made his historic reply, "In the name of the great Jehovah and the continental congress." During the subsequent years of the war the fort changed hands several times. On Oct. 11, 1776, the first battle between an American and a British fleet, the battle of Valcour island, was fought on the lake. Benedict Arnold, the American commander, with a decidedly inferior force, inflicted severe damage on the enemy and then during the night escaped. Although overtaken two days later he again, after a fight of a few hours, made a successful retreat saving all his men.

At the beginning of the War of 1812 the American naval force on the lake, though very small, was superior to that of the British, but on June 3, 1813, the British captured two American sloops in the narrow channel at the northern end and gained supremacy. Both sides now began to build and equip vessels for a decisive contest. By May, 1814, the Americans had regained supremacy, and four months later a British land force of 11,000 men under Sir George Prevost and a naval force of 16 vessels of about 2,402 tons with 937 men and 92 guns under Capt. George Downie confronted an American land force of 1,500 men under Brigadier General Alexander Macomb, strongly entrenched at Plattsburg, and an American naval force in Plattsburg bay of 14 vessels of about 2,244 tons with 882 men and 86 guns under Commodore Thomas MacDonough (1783-1825). The naval battle occurred on the morning of Sept. 11, 1814. Although the weight of the metal thrown by the guns of MacDonough's American fleet was greater than that of the British fleet, the latter had more guns of long range. Knowing that in a battle in the open lake he would be at a disadvantage, MacDonough anchored his fleet in such a way as to force Downie to pass between him and the land and to prevent him from anchoring his fleet out of range of the American guns. Downie was killed early in the fight, and the British fleet was soon driven out of action or surrendered. The American loss was 52 killed and 58 wounded, and the British loss was 57 killed and 92 wounded. The land forces engaged in desultory fighting but no decisive action occurred. As the lake was entirely in the control of the Americans, Prevost was forced to retreat during the night of Sept. 12-13, leaving his sick and wounded behind. The British gave up further efforts to invade New York.

CHAMPLAIN CANAL: see NEW YORK STATE BARGE CANAL SYSTEM.

CHAMPMESLÉ, MARIE (1642-1698), née DESMARES, French actress, was born in Rouen and made her first appearance on the stage at Rouen with Charles Chevillet (1645-1701), who called himself sieur de Champmeslé, and they were married in 1666. By 1669 they were playing in Paris at the Théâtre du Marais. The next year, as Hermione in Racine's *Andromaque*, she had a great success at the Hôtel de Bourgogne. Her intimacy with Racine dates from then. Some of his finest tragedies were written for her, but her repertoire was not confined to them, and many an indifferent play—like Thomas Corpeille's *Ariane* and *Comte d'Essex*—owed its success to "her natural manner of acting and her pathetic rendering of the hapless heroine." *Phèdre* was the climax of her triumphs, and when she and her husband deserted the Hôtel de Bourgogne (see BÉJART *ad fin.*),

it was selected to open the Comédie Française on Aug. 26, 1680. There, with Mme. Guérin as the leading comedy actress, she played the great tragic love parts for more than 30 years, dying on May 15, 1698. La Fontaine dedicated to her his novel *Belphégor*, and Boileau immortalized her in verse.

Her brother, the actor NICOLAS DESMARES (c. 1650-1714), began as a member of a subsidized company at Copenhagen. After 1685 he played peasant parts with great success at the Comédie Française. His daughter, to whom Christian V. and his queen stood sponsors, CHRISTINE ANTOINETTE CHARLOTTE DESMARES (1682-1753), was a fine actress in both tragedy and soubrette parts. She made her début at the Comédie Française in 1699, in La Grange Chancel's *Oreste et Pylade*, and was at once received as *sociétaire*. She retired in 1721.

CHAMPOLLION, JEAN FRANÇOIS (1790-1832), French Egyptologist, called LE JEUNE to distinguish him from Champollion-Figeac (*q.v.*), his elder brother, was born at Figeac, in the department of Lot, on Dec. 23, 1790. At the age of 16 he read before the academy of Grenoble a paper in which he maintained that the Coptic was the ancient language of Egypt. He soon after removed to Paris. In 1809 he was made professor of history in the Lyceum of Grenoble. His first decipherment of hieroglyphics dates from 1821. In 1824 he was sent by Charles X. to visit the Egyptian antiquities in the museums of Italy; and on his return was appointed director of the Egyptian museum at the Louvre. In 1828 he was commissioned to conduct a scientific expedition to Egypt in company with Rosellini. In March 1831 he received the chair of Egyptian antiquities, which had been created specially for him, in the Collège de France. He was engaged with Rosellini in publishing the results of their Egyptian researches when he died at Paris (1832). Champollion is now universally acknowledged to have been the founder of Egyptology.

He wrote *L'Égypte, sous les Pharaons* (2 vols. 8vo. 1814); *Sur l'écriture hiératique* (1821); *Sur l'écriture démotique; Précis du système hiéroglyphique, etc.* (1824); *Panthéon égyptien, ou collection des personnages mythologiques de l'ancienne Égypte* (incomplete); *Monuments de l'Égypte et de la Nubie considérés par rapport à l'histoire, la religion, etc.*; *Grammaire égyptienne* (1836), and *Dictionnaire égyptienne* (1841), edited by his brother; *Analyse méthodique du texte démotique de Rosette; Aperçu des résultats historiques de la découverte de l'alphabet hiéroglyphique* (1827); *Mémoires sur les signes employés par les Égyptiens dans leurs trois systèmes graphiques à la notation des principales divisions du temps; Lettres écrites d'Égypte et de Nubie* (1833); and also several letters on Egyptian subjects, addressed at different periods to the duc de Blacas and others.

See H. Hartleben, *Champollion, sein Leben und sein Werk* (2 vols., 1906); *Lettres de Champollion le Jeune* (1909); also EGYPT, *Language and Writing* (*ad init.*).

CHAMPOLLION-FIGEAC, JACQUES JOSEPH (1778-1867), French archaeologist, elder brother of Jean François Champollion, was born at Figeac in the department of Lot, on Oct. 5, 1778. He became keeper of manuscripts at the Bibliothèque Nationale in Paris, and professor of palaeography at the École des Chartes. In 1849 he became librarian of the palace of Fontainebleau. His works include, *Nouvelles recherches sur les patois ou idiomes vulgaires de la France* (1809), *Annales de Lagides* (1819) and *Chartes latines sur papyrus du VI^e siècle de l'ère chrétienne*. His son ARMÉ (1812-1894) became his assistant at the Bibliothèque Nationale, and in addition to a number of historical works wrote a biographical and bibliographical study of his family in *Les Deux Champollion* (Grenoble, 1887).

CHANCE, an accident or event, a phenomenon which has no apparent or discoverable cause; hence an event which has not been expected, a piece of good or bad fortune. From the popular idea that anything of which no assignable cause is known has therefore no cause, chance was regarded as having a substantial objective existence, being itself the source of such uncaused phenomena. For the philosophic theories relating to this subject see ACCIDENTALISM.

"Chance," in the theory of probability, is used in two ways. In the stricter or mathematical usage, it is synonymous with probability, *i.e.*, if a particular event may occur in n ways in an aggregate of p events, then the "chance" of the particular event occurring is given by the fraction n/p . In the second usage, the

"chance" is regarded as the ratio of the number of ways which a particular event may occur to the number of ways in which it may not occur; mathematically expressed, this chance is $n/(p-n)$. This is more usually called Odds (see PROBABILITY). In the English law relating to gaming and wagering a distinction is drawn between games of chance and games of skill (see GAMING AND WAGERING).

CHANCEL, strictly, that part of a church close to the altar and separated from the nave (*q.v.*) by cancelli or screens. This

LOOKING DOWN OVER THE CHOIR INTO THE CHANCEL OF THE SALAMANCA CATHEDRAL, SPAIN. THE ALTAR IS SEEN IN THE CENTRE BACKGROUND

space, originally known as the space *inter cancellos*, or *locus altaris cancellis septus*, came itself to be called the chancel. Later the word came to include the whole of that part of the church occupied by altars, communion tables and all the officiating clergy and singers, *i.e.*, the presbytery (*q.v.*), the chancel proper and the choir (*q.v.*). In some cases the word is used synonymously with choir.

In basilican churches, the chancel is set apart only by a low railing; *e.g.*, S. Clemente, Rome. Such divisions correspond more to the altar, communion or sanctuary rail of a modern church than to the developed mediaeval chancel screen. In the highly organized mediaeval church, the chancel is clearly differentiated from the nave by the raising of the floor level, and by the chancel or rood screen (see *ROOD*). This screen is frequently continued on each side, behind the choir stalls, and around the east end of the cathedrals of sanctuary, as in Paris, Bourges and Amiens. At the side, such screens form the back of the choir stalls. The chancel screen in front of the altar is sometimes only a low parapet, sometimes a light, openwork structure of wood or metal, but often, especially in the large cathedrals and abbeys of England, a massive and solid stone structure, frequently carrying the organ. In collegiate and monastic churches, these screens thus completely separated the spaces reserved for services for the members of the clerical community from the spaces for popular services, for which a second altar was usually set up to the west of the screen, as formerly in Westminster Abbey.

Chancel sizes vary enormously. On the European continent they usually extend from the east end to the crossing, as in many modern churches, but in abbey churches, and generally in English mediaeval churches, they comprise also several bays of the nave. In the churches of Paris the chancel is relatively small. The chancel screen becomes more open and its main function is to support a crucifixion group; it is, therefore, primarily a rood screen. In small churches, the chancel is sometimes lower and narrower than the nave.

CHANCELLOR, RICHARD (d. 1556), English seaman, is said to have been brought up by the father of Sir Philip Sidney. Nothing is known of his own family except that he had two sons. In 1553 Sir Hugh Willoughby fitted out an expedition in search of the North-West passage to India, of which Chancellor was appointed "pilot-general." It was arranged that the expedition should meet at Vardohuus, but owing to unfavourable weather, Chancellor's was the only one of the original seven ships which arrived at the rendezvous. He therefore went on alone into the White Sea, and thence overland to Moscow. The emperor showed him great hospitality in Moscow, and gave him a letter for the king of England giving very favourable conditions for English trade. Chancellor rejoined his ship in the summer of 1554, and came back to England, after having, by his successful negotiations, laid the foundations of English trade with Russia. The Muscovy Company was established as a result of this voyage. In 1555 Chancellor left England again for Moscow, which he reached in November. He lost his life on the return voyage, on Nov. 10, off Pitsligo on the coast of Aberdeenshire.

See Hakluyt's *Principal Navigations*, etc., vol. i.

CHANCELLOR, an official title used by most of the peoples whose civilization has arisen directly or indirectly out of the Roman empire. It stands for very various duties, and is borne by officers of various degrees of dignity. The original chancellors were the *cancellarii* of Roman courts of justice, ushers who sat at the *cancelli* or lattice work screens of a "basilica" or law court, which separated the judge and counsel from the audience (see *CHANCEL*). In the later Eastern empire the *cancellarii* were promoted at first to notarial duties. The barbarian kingdoms which arose on the ruin of the empire in the West copied more or less intelligently the Roman model in all their judicial and financial administration. Under the Frankish kings of the Merovingian dynasty the *cancellarii* were subordinates of the great officer of state called the *referendarius*, the predecessor of the modern chancellor. The office became established under the form *archi-cancellarius*, or chief of the *cancellarii*. Stubbs says that the Carolingian chancellor was the royal notary and the arch-chancellor keeper of the royal seal. His functions would naturally be discharged by a cleric in times when book learning was mainly confined to the clergy. From the reign of Louis the Pious the post was held by a bishop. By an equally natural process he became the chief secretary of the king and of the queen, who also had her chancellor. Such an office would develop on the judicial as well as the administrative side. Appeals and petitions of aggrieved persons would pass through the chancellor's hands, as well as the political correspondence of the king. Great officers and corporations also had occasion to employ an agent to do secretarial, notarial and judicial work for them, and called him by the convenient name of chancellor.

The Chancellor in England.—The model of the Carolingian court was followed by the mediaeval states of Western Europe. In England the office of chancellor dates back to the reign of Edward the Confessor, the first English king to use the Norman practice of sealing instead of signing documents. The chancellor was originally, and long continued to be, an ecclesiastic, who combined the functions of the most dignified of the royal chaplains, the king's secretary in secular matters, and keeper of the royal seal. From the first, then, though at the outset overshadowed by that of the justiciar, the office of chancellor was one of great influence. As chaplain the chancellor was keeper of the king's conscience; as secretary he enjoyed the royal confidence in secular affairs; as keeper of the seal he was necessary to all formal expressions of the royal will. By him and his staff of chaplains the whole secretarial work of the royal household was conducted, the accounts were kept under the justiciar and treasurer, writs were drawn up and sealed, and the royal correspondence was carried on. He was, in fact, as Stubbs put it, a sort of secretary of state for all departments. "This is he," wrote John of Salisbury (d. 1180), "who cancels (*cancellat*) the evil laws of the realm, and makes equitable (*aequa*) the commands of a pious prince," a curious anticipation of the chancellor's later equitable jurisdiction. Under Henry II., indeed, the chancellor was already

employed in judicial work, either in attendance on the king or in provincial visitations; though the peculiar jurisdiction of the chancery was of later growth. By this time, however, the chancellor was "great alike in Curia and Exchequer"; he was *secundus a rege*, i.e., took precedence immediately after the justiciar, and nothing was done either in the Curia or the exchequer without his consent. So great was his office that William FitzStephen, the biographer of Becket, tells us that it was not purchasable (*emenda non est*), a statement which requires modification, since it was in fact more than once sold under Henry I., Stephen, Richard and John (Stubbs, *Const. Hist.* i. pp. 384-497; Gneist, *Const. Hist. of England*, p. 219), an evil precedent which was, however, not long followed.

The judicial duties of the chancellor grew out of the fact that all petitions addressed to the king passed through his hands. The number and variety of these became so great that in 1280, under Edward I., an ordinance was issued directing the chancellor and the justices to deal with the greater number of them; those which involved the use of the great seal being specially referred to the chancellor. The chancellor and justices were to determine which of them were "so great, and of grace, that the chancellor and others would not despatch them without the king," and these the chancellor and other chief ministers were to carry in person to the king (Stubbs ii. 263, and note, and p. 268). At this period the chancellor, though employed in equity, had ministerial functions only; but when, in the reign of Edward III., the chancellor ceased to follow the court his tribunal acquired a more definite character, and petitions for grace and favour began to be addressed primarily to him, instead of being merely examined and passed on by him to the king; and in the 22nd year of this reign matters which were of grace were definitely committed to the chancellor for decision. This is the starting-point of the equitable jurisdiction of the chancellor, whence developed that immense body of rules, supplementing the deficiencies or modifying the harshness of the common law, which is known as Equity (*q.v.*).

The Chancellor in Parliament.—The position of the chancellor as speaker or prolocutor of the House of Lords dates from the time when the ministers of the royal Curia formed *ex officio* a part of the *commune concilium* and parliament. The chancellor originally attended with the other officials, and he continued to attend *ex officio* after they had ceased to do so. If he chanced to be a bishop, he was summoned regularly *qua* bishop; otherwise he attended without summons. When not a peer the chancellor had no place in parliament except as chancellor, and the act of 31 Henry VIII. cap. 10 (1539) laid down that, if not a peer, he had "no interest to give any assent or dissent in the House." Yet Sir Robert Bourchier (d. 1349), the first lay chancellor, had protested in 1341 against the first statute of 15 Edward III. (on trial by peers, etc.), on the ground that it had not received his assent and was contrary to the laws of the realm. From the time, however, of William, Lord Cowper (first lord high chancellor of Great Britain in 1705, created Baron Cowper in 1706), all chancellors have been made peers on their elevation to the woolsack. Sometimes the custody of the great seal has been transferred from the chancellor to a special official, the lord keeper of the great seal (*see* LORD KEEPER); this was notably the case under Queen Elizabeth (*cf.* the French *garde des sceaux*, below). Sometimes it is put into commission, being affixed by lords commissioners of the great seal. By the Catholic Emancipation Act of 1829 it was enacted that none of these offices could be held by a Roman Catholic (*see* further under LORD HIGH CHANCELLOR). The office of lord chancellor of Ireland and that of chancellor of Scotland (who ceased to be appointed after the Act of Union 1707) followed the same lines.

Chancellor of the Exchequer.—The title of chancellor, without the predicates "high" or "lord," is also applied in Great Britain to a number of other officials and functionaries. Of these the most important is the chancellor of the Exchequer, an office which originated in the separation of the chancery from the Exchequer in the reign of Henry III. (1216-72). His duties consisted originally in the custody and employment of the seal of the Exchequer, in the keeping of a counter-roll to check the roll kept

by the treasurer, and in the discharge of certain judicial functions in the exchequer of account. So long as the treasury board was in active working the chancellorship of the Exchequer was an office of small importance, and even during a great part of the 19th century was not necessarily a cabinet office, unless held in conjunction with that of first lord of the Treasury. At the present time the chancellor of the Exchequer is minister of finance, and therefore always of cabinet rank (*see* EXCHEQUER).

Chancellor of the Duchy.—The chancellor of the duchy of Lancaster is the representative of the crown in the management of its lands and the control of its courts in the duchy of Lancaster, the property of which is scattered over several counties. These lands and privileges, though their inheritance has always been vested in the king and his heirs, have always been kept distinct from the hereditary revenues of the sovereign, whose palatine rights as duke of Lancaster were distinct from his rights as king. The Judicature Act of 1873 left only the chancery court of the duchy, but the chancellor can appoint and dismiss the county court judges within the limits of the duchy; he is responsible also for the land revenues of the duchy, which are the private property of the sovereign, and keeps the seal of the duchy. As the judicial and estate work is done by subordinate officials, the office is usually given to a minister whose assistance is necessary to a government, but who for one reason or another cannot undertake the duties of an important department. John Bright described him as the maid-of-all-work of the cabinet.

Ecclesiastical Chancellors.—The chancellor of a diocese is the official who presides over the bishop's court and exercises jurisdiction in his name. This use of the word is comparatively modern, and, though employed in acts of parliament, is not mentioned in the commission, having apparently been adopted on the analogy of the like title in the State. The chancellor was originally the keeper of the archbishop's or bishop's seals; but the office, as now understood, includes two other offices distinguished in the commission by the titles of vicar-general and official principal (*see* ECCLESIASTICAL JURISDICTION). The chancellor of a diocese must be distinguished from the chancellor of a cathedral, whose office is the same as that of the ancient *scholasticus* (*see* CATHEDRAL).

Academic, etc.—The chancellor of an order of knighthood discharges notarial duties and keeps the seal. The chancellor of a university is an official of mediaeval origin. The appointment was originally made by the popes, and the office from the first was one of great dignity and originally of great power. The chancellor was, as he remains, the head of the university; he had the general superintendence of its studies and of its discipline, could make and unmake laws, try and punish offences, appoint to professorial chairs and admit students to the various degrees. In England the chancellorship of the universities is conferred on noblemen or statesmen of distinction, whose principal function is to look after the general interests of the university, especially in its relations with the government. The chancellor is represented in the university by a vice-chancellor, who performs the administrative and judicial functions of the office. In the United States the heads of certain educational establishments have the title of chancellor. In Scotland, the foreman of a jury is called its chancellor. In the United States the chancellors are judges of the chancery courts of the states, e.g., Delaware and New Jersey, where these courts are still maintained as distinct from the courts of common law. In other states, e.g., New York since 1847, the title has been abolished, and there is no federal chancellor.

In diplomacy generally the chancellor of an embassy or legation is an official attached to the suite of an ambassador or minister. He performs the functions of a secretary, archivist, notary and the like, and is at the head of the chancery, or chancellery, of the mission. The functions of this office are the transcribing and registering of official despatches and other documents, and generally the transaction of all the minor business, e.g., marriages, passports and the like, connected with the duties of a diplomatic agent towards his nationals in a foreign country.

France.—The country in which the office of chancellor followed most closely the same lines as in England is France. He

had become a great officer under the Carolingians, and he grew still greater under the Capetian sovereigns. The great chancellor, *summus cancellarius* or *archi-cancellarius*, was a dignitary who had indeed little real power. The post was commonly filled by the archbishop of Reims, or the bishop of Paris. The *cancellarius*, who formed part of the royal court and administration, was officially known as the *sub-cancellarius* in relation to the *summus cancellarius*, but as *proto-cancellarius* in regard to his subordinate *cancellarii*. He was a very great officer, an ecclesiastic who was the chief of the king's chaplains or king's clerks, who administered all ecclesiastical affairs; he had judicial powers, and from the 12th century had the general control of foreign affairs. The chancellor in fact became so great that the Capetian kings, who did not forget the mayor of the palace, grew afraid of him. Few of the early ecclesiastical chancellors failed to come into collision with the king, or parted with him on good terms. Philip Augustus suspended the chancellorship throughout the whole of his reign, and appointed a keeper of the seals (*garde les sceaux*). The office was revived under Louis VIII., but the ecclesiastical chancellorship was finally suppressed in 1227. The kings of the 13th century employed only keepers of the seal. Under the reign of Philip IV. le Bel, lay chancellors were first appointed. From the reign of Charles V. to that of Louis XI. the French *chancelier* was elected by the royal council. In the 16th century he became irremovable, a distinction more honourable than effective, for though the king could not dismiss him from office he could, and on some occasions did, deprive him of the right to exercise his functions, and entrusted them to a keeper of the seal. The *chancelier* from the 13th century downwards was the head of the law, and performed the duties which are now entrusted to the minister of justice. His office was abolished by the Revolution. The smaller *chanceliers* of the provincial *parlements* and royal courts disappeared at the same time. But when Napoleon was organizing the empire he created an arch-chancellor, an office which was imitated rather from the *Erz-Kanzler* of the Holy Roman empire than from the old French *chancelier*. At the Restoration the office of chancellor of France was restored, the chancellor being president of the House of Peers, but it was finally abolished at the revolution of 1848. The administration of the Legion of Honour is presided over by a *grand chancelier*, who is a grand cross of the order, and who advises the head of the state in matters concerning the order. The title of *chancelier* continues also to be used in France for the large class of officials who discharge notarial duties in some public offices, in embassies and consulates. They draw up diplomas and prepare all formal documents, and have charge of the registration and preservation of the archives.

Spain.—In Spain the office of chancellor, *canciller*, was introduced by Alphonso VII. (1126–57), who adopted it from the court of his cousins of the Capetian dynasty of France. The *canciller* did not in Spain go beyond the king's notary. The chancellor of the privy seal, *canciller del sello de la puridad* (literally the secret seal), was the king's secretary, and sealed all papers other than diplomas and charters. The office was abolished in 1496, and its functions were transferred to the royal secretaries. The *cancilario* was the chancellor of a university. The *canciller* succeeded the *maesescuela* or *scholasticus* of a church or monastery. *Canciller mayor de Castilla* is an honorary title of the archbishops of Toledo. The *gran canciller de las Indias*, high chancellor of the Indies, held the seal used for the American dominions of Spain, and presided at the council in the absence of the president. The office disappeared with the loss of Spain's empire in America.

Italy, Germany, etc.—In central and northern Europe, and in Italy, the office had different fortunes. In southern Italy, where Naples and Sicily were feudally organized, the chancellors of the Norman kings, who followed Anglo-Norman precedents very closely, and, at least in Sicily, employed Englishmen, were such officers as were known in the West. The similarity is somewhat concealed by the fact that these sovereigns also adopted names and offices from the imperial court at Constantinople. Their chancellor was officially known as Protonotary and Logothete, and their example was followed by the German princes of the Hohenstaufen

family, who acquired the kingdoms of Naples and Sicily. The papal or apostolic chancery is dealt with in the article on the Curia Romana (q.v.).

The title of arch-chancellor (*Erz-Kanzler*) was borne by three great ecclesiastical dignitaries of the Holy Roman empire. The archbishop of Mainz was arch-chancellor for Germany. The archbishop of Cologne held the dignity for Italy, and the archbishop of Trier for Gaul and the kingdom of Arles. The second and third of these dignities became purely formal with the decline of the empire in the 13th century. But the arch-chancellorship of Germany remained to some extent a reality till the empire was finally dissolved in 1806. The office continued to be attached to the archbishopric of Mainz, which was an electorate. Karl von Dalberg, the last holder of the office, and the first prince primate of the Confederation of the Rhine, continued to act in show at least as chancellor of that body, and was after a fashion the predecessor of the *Bundeskanzler*, or chancellor of the North German Confederation. The duties imposed on the imperial chancery by the very complicated constitution of the empire were, however, discharged by a vice-chancellor attached to the court of the emperor. The abbot of Fulda was chancellor to the empress.

The house of Austria in their hereditary dominions, and in those of their possessions which they treated as hereditary, even where the sovereignty was in theory elective, made a large and peculiar use of the title chancellor. The officers so called were of course distinct from the arch-chancellor and vice-chancellor of the empire, although the imperial crown became in practice hereditary in the house of Habsburg. In the family states their administration was, to use a phrase familiar to the French, "polysynodic." As it was when fully developed, and as it remained until the March revolution of 1848, it was conducted through boards presided over by a chancellor. There were three aulic chancellorships for the internal affairs of their dominions, "a united aulic chancellorship for all parts of the empire (i.e., of Austria, not the Holy Roman) not belonging to Hungary or Transylvania, and a separate chancellorship for each of those last-mentioned provinces" (Hartig, *Genesis of the Revolution in Austria*). There were also a house, a court, and a state chancellor for the business of the imperial household and foreign affairs, who were not, however, the presidents of a board. These "aulic" (i.e., court) officers were in fact secretaries of the sovereign, and administrative or political rather than judicial in character, though the boards over which they presided controlled judicial as well as administrative affairs. In the case of such statesmen as Kaunitz and Metternich, who were house, court and state chancellors as well as "united aulic" chancellors, the combination of offices made them in practice prime ministers, or rather lieutenants-general, of the sovereign.

In the modern German empire the *Reichskanzler* was the immediate successor of the *Bundeskanzler*, or chancellor of the North German Confederation (*Bund*). But the *Bundeskanzler*, who bore no sort of resemblance save in name to the *Erz-Kanzler* of the old empire, was in a position not perhaps actually like that of Prince Kaunitz, but capable of becoming much the same thing. When the German empire was established in 1871 Prince Bismarck, who was *Bundeskanzler* and became *Reichskanzler*, took care that his position should be as like as possible to that of Prince Kaunitz or Prince Metternich. The constitution of the German empire is separately dealt with, but it may be pointed out here that the *Reichskanzler* was the federal minister of the empire, the chief of the federal officials, and a great political officer, who directed the foreign affairs, and superintended the internal affairs, of the empire.

In these German states the title of chancellor is also given as in France to government and diplomatic officials who do notarial duties and have charge of archives. The title of chancellor has naturally been widely used in the German and Scandinavian States, and in Russia since the reign of Peter the Great. It has there, as elsewhere, wavered between being a political and a judicial office. Frederick the Great of Prussia created a *Gross-Kanzler* for judicial duties in 1746. But there was in Prussia a state chancellorship on the Austrian model. It was allowed to lapse on the death of Hardenberg in 1822. The Prussian chancellor after his

time was one of the four court ministries (*Hofämter*) of the Prussian monarchy.

CHANCELLORSVILLE, a village of Spottsylvania county, Virginia, U.S.A., situated almost midway between Washington and Richmond. It was the central point of one of the greatest battles of the Civil War, fought on May 2 and 3, 1863, between the Union army of the Potomac under Maj.-gen. Hooker, and the Confederate army of Northern Virginia under Gen. Lee. (See AMERICAN CIVIL WAR, and WILDERNESS.) Gen. "Stonewall" Jackson was mortally wounded in this battle.

CHANCE-MEDLEY, an accident of a mixed character, an old term in English law for a form of homicide arising out of a sudden affray or quarrel. This term is not in use in the United States. Manslaughter in one of its various degrees would embrace such a homicide, under U.S. law.

CHANCERY, in English law, the court of the lord chancellor of England, consolidated in 1873 along with the other superior courts in the Supreme Court of Judicature. Its origin is noticed under the head of CHANCELLOR.

It has been customary to say that the court of chancery consists of two distinct tribunals—one a court of common law, the other a court of equity. From the former have issued all the original writs passing under the great seal, all commissions of sewers, lunacy, and the like—some of these writs being originally kept in a *hanaper* or hamper (whence the "hanaper office"), and others in a little sack or bag (whence the "petty-bag office"). The court had likewise power to hold pleas upon *scire facias* (q.v.) for repeal of letters patent, etc. "So little," says Blackstone, "is commonly done on the common law side of the court that I have met with no traces of any writ of error being actually brought since the 14th year of Queen Elizabeth."

The equitable jurisdiction of the court of chancery was founded on the supposed superiority of conscience and equity over the strict law. The appearance of equity in England is in harmony with the general course of legal history in progressive societies. What is remarkable is that, instead of being incorporated with or superseding the common law, it gave rise to a wholly independent set of tribunals. The claims of equity in its earlier stages are well expressed in the little treatise called *Doctor and Student*, published in the reign of Henry VIII.:—"Conscience never resisteth the law nor addeth to it, but only when the law is directly in itself against the law of God, or law of reason." So also King James, speaking in the Star Chamber, says: "Where the rigour of the law in many cases will undo a subject, then the chancery tempers the law with equity, and so mixes mercy with justice, as it preserves a man from destruction." By the time of Lord Eldon equity had become fixed, and the judges, like their brethren in the common law courts, strictly followed the precedents. Henceforward chancery and common law courts have exhibited the anomaly of two co-ordinate sets of tribunals, empowered to deal with the same matters, and compelled to proceed in many cases on wholly different principles. The court of chancery could in most cases prevent a person from taking advantage of a common law right, not approved of by its own system. But if a suitor chose to go to a court of common law, he might claim such unjust rights, and it required the special intervention of the court of equity to prevent his enforcing them. In many cases also a special application had to be made to chancery for facilities which were absolutely necessary to the successful conduct of a case at common law. Another source of difficulty and annoyance was the uncertainty in many cases whether the chancery or common law courts were the proper tribunal, so that a suitor often found at the close of an expensive and protracted suit that he had mistaken his court and must go elsewhere for relief. "If this be equity, give me law," was said to be the cry of

the disappointed suitor in chancery, while the unsuccessful defendant in the King's Bench was heard to exclaim "If this be law, give me equity!" Attempts more or less successful were made to lessen those evils by giving the powers to both sets of courts; but down to the consolidation effected by the Judicature Act, the English judicial system justified the sarcasm of Lord Westbury, that one tribunal was set up to do injustice and another to stop it.

The equitable jurisdiction of chancery was commonly divided into *exclusive*, *concurrent* and *auxiliary*. Chancery had exclusive jurisdiction when there were no forms of action by which relief could be obtained at law, in respect of rights which ought to be enforced. Trusts were the most conspicuous example of this class. It also included certain rights of married women, infants and lunatics. Chancery had concurrent jurisdiction when the common law did not give *adequate* relief, e.g., in cases of fraud, accident, mistake, specific performance of contracts, etc. It had auxiliary jurisdiction when the administrative machinery of the law courts was unable to procure the necessary evidence.

The Judicature Act 1873, s. 24 (now repealed and replaced by the Judicature Act 1925, s. 37 [1]), enacts that in every civil cause or matter commenced in the High Court of Justice, law and equity shall be administered by the High Court of Justice and the court of appeal respectively, according to the rules therein contained, which provide for giving effect in all cases to "equitable rights and other matters of equity." The 44th section of the act of 1925 declares the law to be administered in England on certain points, and ordains that "generally in all matters not hereinbefore particularly mentioned in which there is any conflict or variance between the rules of equity and the rules of the common law with reference to the same matter, the rules of equity shall prevail." The 56th section specifically assigns certain matters to the chancery division.

The chancery division originally consisted of the lord chancellor as president and the master of the rolls and the vice-chancellors. The master of the rolls was also a member of the new court of appeal, but Sir George Jessel, who held that office when the new system came into force, regularly sat as a judge of first instance until 1881, when, by the act of that year (s. 2), the master of the rolls became a member of the court of appeal only. The chancery division now consists of the lord chancellor and six puisne judges, who are divided into groups of three. The judge may either hear an application in chambers, or may direct any matter which he thinks of sufficient importance to be argued before him in court, or a party may move in court to discharge an order made in chambers with a view to an appeal, but this is not required if the judge certifies that the matter was sufficiently discussed before him in chambers. Under the existing rules of court many orders can now be made on summons in chambers which used formerly to require a suit or petition in court. Bankruptcy and winding up business is now dealt with by a judge or judges of the chancery division.

In the United States "chancery" is generally used as the synonym of "equity." Chancery courts are equity courts in the few jurisdictions where such courts are maintained separately. (See EQUITY.) For the diplomatic sense of chancery (chancellery) see CHANCELLOR; and DIPLOMATIC. (X.; W. V. B.).

CHAN CHAN, a ruined and deserted pre-Inca city on the coast of Peru, situated some 300 m. north of Lima and approximately 2 m. north of Trujillo, in the department of La Libertad. It was once the capital of a populous, powerful and relatively advanced civilization variously known as the Chimú, Yunga or Mochica, whose influence extended from the department of Lambayeque southward to Ancón, not far from Lima.

The city itself covers a considerable area, and from a careful survey and estimate must have had a population of at least 250,000 at the height of its glory. It consists of a group of separate walled cities, each surrounded by massive walls from 30 to 40 ft. high, from 8 to 12 ft. in thickness at the base and from 1 to 3 ft. at the top; the walls, as well as the houses, so-called palaces, temples and other structures are constructed of adobe bricks, plastered over in most cases with a smooth coat of adobe. No stone and apparently little or no wood entered into the buildings.

Owing to a dry and comparatively rainless climate with no great extremes of temperature the ruins, which under other conditions would surely have disappeared, are in a remarkable state of preservation.

The Chimu.—Whence the population came no one can say. We do know, however, from skeletal remains that are found in great abundance in the burying-grounds about and in the ruins, that they were totally unlike any of the other pre-Columbian peoples of South America, the characteristic that distinguished them being that they were a broad-skulled or brachycephalic race while the Quichuas and Aymaras, Andean tribes who formed the Inca confederation, were respectively a mesaticephalic (or normal) and a dolichocephalic (or long-skulled) people. In this peculiarity the Chimu were more closely allied to the Mayas of the Yucatan peninsula, Southern Mexico, Guatemala and Honduras than any other people of the Western Hemisphere. This lends colour to the theory that they were an off-shoot of the Mayas that broke away from the original stock in remote times and made their way to the coast of Peru where they established and built up the civilization of which we are here treating.

When they settled on these shores is equally hazy. Certain it is that if they drifted here by sea they must have come in comparatively small numbers. On the other hand, if they migrated by land—which seems less probable—they must, at the rate primitive people and people without any fixed objective migrate, have been centuries in building up the civilization of which we find remains to-day, so that it is quite probable that their advent on the coast of Peru may have been about the time of the beginning of the Christian era.

We know their fate somewhat more definitely from legends and accounts related by the Incas upon the arrival of the Spaniards. From these we learn that for a century, more or less, a bitter war was waged between the Inca confederation or Andean tribes and the coastal peoples, the Chimu in the north and the Nazca in the south. Many and fierce are the struggles recorded and the Incas eventually defeated the coastal tribes at their great fortress of Paramonga, near Supe, not far from Huacho on the Peruvian coast north of Lima. This fortress remains to this day and is in a remarkable state of preservation. Having been defeated at Paramonga the Chimu retired behind the walls of their capital, Chan Chan, and were here starved into submission by the besieging Incas. Whether the Chimu were wholly exterminated by their enemies or whether, as was the Inca custom with conquered tribes, they were broken up and distributed in small numbers throughout the empire, we do not know. Certain it is, however, that when the Spaniards came there were no evident remains of the Chimu save their ruined and deserted cities, remains of their irrigation systems and other like traces. This extermination of the coastal peoples has been reckoned to have taken place some 130 or 140 years before the coming of the Spaniards, which would put it in the neighbourhood of the year A.D. 1400.

Remains.—From a study of the ruins we know that Chan Chan was the seat of a great empire whose extent was the entire coast from Lambeyque on the north to about Ancón on the south. We also know that these were a people who lived mainly by agricultural pursuits. In the vicinity of Chan Chan itself, in the valley of the Chicama, Moche, Viru and other Andean streams, there are evidences of truly remarkable systems of irrigation and certain signs that agriculture was carried on to a considerably greater extent in those ancient times than it is to-day. Fishing also formed an important part of their life and conventionalized figures of fishes and maritime birds form the principal motifs in their mural and other decorations.

That they were highly developed in the arts is likewise patent. They knew the art of mining, smelting and working such metals as gold, silver and copper, though none of the other metals have been found in the ruins. Metal utensils, ornaments and other objects are still found in and about Chan Chan, as are also the remains of an ancient smelter, with considerable quantities of slag. The Chimu were also expert potters; examples of their work are to be found in many museums. Strange to note, there are three known strata of pottery, that in the lowest being of the finest

quality, while the top stratum is the poorest, indicating that the art degenerated. From their pottery much of their life and habits may be reconstructed. Wood, as has been noted, appears to play very little part in their arts. This is probably because of the indigenous trees, the willow was too soft and perishable for practical use and the algarroba too hard to be worked. Hence wood was used but little, if at all, except in the making of idols, musical instruments and small objects.

Save for a few small settlements, notably at Huanchaco and at Moche, in the vicinity of Trujillo, where the inhabitants show traces of brachycephalism, the ruined cities, irrigation works, fortresses and the like, as well as all traces of these peoples, have disappeared. (O. Ho.)

CHANCRE is a term formerly used loosely, to designate any sore or ulcer, especially one of a corroding nature or venereal origin. It is now applied almost exclusively to the primary lesion of syphilis, which used to be called a hard, indurated or Hunterian chancre. It appears at the site of inoculation in from one to seven weeks after exposure, and is most commonly found on the external genitals, but sometimes on the lip, tongue and other parts. A small, hard, translucent swelling appears at the infected spot, becomes gradually larger (up to one inch), and often breaks in the centre leaving a shallow ulcer. This lesion is the chancre and represents the first reaction of the body tissues to the causative agent, the *Treponema pallidum*. The diagnosis is established by finding the organism in scrapings from the ulcer. (See SYPHILIS.)

CHANDA. The southernmost District of the Central Provinces of British India.

Chanda Town is the old capital of an ancient Gond dynasty, situated near the confluence of the Erai and Wardha rivers. It once had a much larger population for there are now waste and cultivated fields inside the stone walls, which have a circumference of five and a half miles, whilst the modern suburbs of the town have grown up outside the city walls, and in the jungles which hem in the city on two sides there are many traces of old habitations. The town is noted for its silk woven fabrics, ornamental slippers and other minor industries of the same kind. Outside one of the gates is held an annual fair attended by 100,000 people. After a great decline from its ancient status as a Gond capital, it has begun to revive with the construction of roads and railway communications, and its population is now 23,000 as compared with 16,000 in 1872.

District of Chanda.—The District of Chanda is one of the largest districts in the Central Provinces, having an area of 9,312 sq.m., but the twenty Zamindari estates which it contains account for 4,000 sq.m. of wild and thinly populated country, while Government Forest Reserves cover no less than 2,700 sq.m., and include valuable teak and other timber, and large bamboo jungles. Coal of a poor quality is found in the extreme west at Ballarpur and Ghugus, while iron ore of high grade is found in the eastern part of the District. Except in the north-west and on the borders of the Wardha and Nagpur Districts, where cotton and wheat are both grown and there are large areas under juar (sorghum), rice and the small millets are the principal crops. Numbers of irrigation tanks have been constructed by the people to water rice and sugar-cane, to which the Government has added a number of storage reservoirs of some magnitude. Many useful roads have been made since the great famines, and Chanda town is now connected with Wardha on the G.I.P. railway via Warora (where the colliery is now worked out), and by narrow gauge lines with Nagpur and Gondia in the Bhandara district.

It is a most picturesque part of the country, with varied scenery, wooded hills and interesting archaeological remains, old temples and forts, notably at Chanda itself, Bhandak, Markandi and Wairagarh, but the climate is unpleasantly hot, the forests malarious, and the people unprogressive. Several languages are spoken. The Marathi of the north-west gives way to Telugu in the south and to Hindi (Chhattisgarhi) in the north-east. In all the wilder tracts aboriginal races predominate, and Gondi and other tribal dialects are common, as in the neighbouring Bastar State. The total population of the district in 1921 was 660,630. In the famine decade (1891-1901) there was a sharp decrease, and a set-

RUINS OF AN ANCIENT CIVILIZATION

1. Huaca, or Temple, of the Moon, about 10 miles outside of Chan-Chan proper, showing mural paintings in black, red, orange, blues and yellows, against a ground of white
2. Aerial view of the fortress of Paramonga. Here, c. 1400, the Incas defeated the Chimu, practically exterminating them
3. Remains of a garden, showing fanciful patterns formed probably by incrustation of mineral salts in irrigation ditches
4. Decorated walls of palace within grounds of the Esmeralda group. The reduplicated figures are in low relief
5. Characteristic group of ruins, the back wall showing relief decorations formed in the plaster, which covered adobe blocks
6. Presumably an altar of sacrifice, S.E. of the Palace of the Arabesques, a palace 52½ ft. wide and of unknown length

back in the decade 1911-1921 due to influenza, but in the last fifty years the growth of population has, nevertheless, been 30%. Mohammedans number only 11,000. In literacy Chanda is very backward, less than 20,000 (or 3%) being literate. Only 1,600 persons are literate in English.

CHANDAUSI, a town of British India in the Moradabad district of the United Provinces; an important junction (for Aligarh) on the Oudh and Rohilkand railway. Pop. c. 27,000. It exports cotton, hemp, sugar and stone.

CHAND BARDAI (c. A.D. 1200), Hindu poet, a native of Lahore, who lived at the court of Prithiraj, the last Hindu sovereign of Delhi. His *Prithiraj Rasau*, a poem of some 100,000 stanzas, chronicling his master's deeds and the contemporary history of his part of India, is valuable as the earliest monument of the Western Hindi language, and the first of the long series of bardic chronicles for which Rajputana is celebrated. It is written in ballad form, and portions of it are still sung by itinerant bards throughout north-western India and Rajputana.

See J. Tod, *Annals and Antiquities of Rajast'han* (2 vols., 1829-1832).

AMERICAN BRASS CHANDELIER, 18TH CENTURY

CHANDELIER, a frame of metal, wood, crystal, glass or china, suspended from the roof or ceiling for the purpose of holding lights. The word is French, but the appliance has lost its original significance of a candle-holder, the chandelier being now chiefly used for gas and electric lighting. Clusters of hanging lights were in use as early as the 14th century, and appear originally to have been almost invariably of wood. They were, however, so speedily ruined by grease that metal was gradually substituted, and fine and comparatively early examples in beaten iron, brass, copper and even silver are still extant. Throughout the 17th century the hanging candle-holder of brass or bronze was common throughout northern Europe, as innumerable pictures and engravings testify. In the great periods of the art of decoration in France many magnificent chandeliers were made by Boulle, and at a later date by Gouthière and Thomire and others among the extraordinarily clever *fondeurs-ciseleurs* of the second half of the 18th century. The chandelier in rock crystal and its imitations had come in at least a hundred years before their day, and continued in favour to the middle of the 19th century, or even somewhat later. It reached at last the most extreme elaboration of banality, with ropes of pendants and hanging faceted drops often called lustres. When many lights were burning in one of these chandeliers an effect of splendour was produced that was not out of place in a ballroom, but the ordinary household varieties were extremely ugly and inartistic. The more purely domestic chandelier usually carries from two to six lights. The present use of electricity and the modern ideas of interior lighting have pushed into the background the elaborate specimens of the past few centuries and substituted the simpler designs with smaller clusters of lights. (See also LIGHTING OF THE INTERIOR; INTERIOR DECORATION.)

CHANDERNAGORE or **CHANDARNAGAR**, a French settlement in India, with a small adjoining territory, situated on the right bank of the river Hugli, 20m. above Calcutta.

Area 3 sq.m.; pop. (1926) 26,506. Chandernagore has played an important part in the European history of Bengal. It became a permanent French settlement in 1688, but did not rise to any importance till the time of Dupleix, during whose administration the town was transformed and became the focus for a considerable maritime trade. In 1757 Chandernagore was bombarded by an English fleet under Admiral Watson and captured. On peace being established the town was restored to the French in 1763. When hostilities afterwards broke out in 1794, the English again took possession of it and held it till 1816, when it was a second time given up to the French; it has ever since remained in their possession; it is now little more than a quiet riverside town. The authorities of Chandernagore are subject to the jurisdiction of the governor-general of Pondicherry, to whom is confided the general government of all the French possessions in India.

CHANDLER, RICHARD

(1738-1810), British antiquary, was born at Elson in Hampshire. In 1759 he published fragments from the Greek minor poets, with notes (*Elegiaca Graeca*); and in 1763 a fine edition of the Arundelian marbles, *Marmora Oxoniensia*, with a Latin translation, and suggestions for supplying the lacunae. He was sent by the Dilettanti Society with Revett, an architect, and Pars, a painter, to explore the antiquities of Ionia and Greece (1763-66); and the result of their work was the two magnificent folios of *Ionian antiquities* published in 1769. Other works by Chandler were *Inscriptiones Antiquae pleraeque nondum editae* (1774); *Travels in Asia Minor* (1775); *Travels in Greece* (1776); *History of Ilium* (1803); in which he asserted the accuracy of Homer's geography.

MODERN ELECTRIC CHANDELIER WITH FROSTED GLOBES AND SILVERED METAL

His *Life of Bishop Waynflete*, lord high chancellor to Henry VI., appeared in 1811.

A complete edition (with notes by Revett) of the *Travels in Asia Minor and Greece* was published by R. Churton (1825), with an "Account of the Author."

CHANDLER, SAMUEL (1693-1766), English Nonconformist divine, was born in 1693 at Hungerford, Berkshire. He took a leading part in the deist controversies of the time, and discussed with some of the bishops the possibility of an act of comprehension. From 1716-26 he preached at Peckham, and for 40 years he was pastor of a meeting-house in Old Jewry. He died on May 8, 1766, leaving four vols. of sermons (1768), and a paraphrase of the Epistles to the Galatians and Ephesians (1777), several works on the evidence of Christianity, and various pamphlets against Roman Catholicism.

CHANDLER, ZACHARIAH (1813-1879), American politician, was born at Bedford, N.H., on Dec. 10, 1813. In 1833 he removed to Detroit, Mich., where he became a prosperous dry-goods merchant. He took a prominent part as a Whig in politics, and, impelled by his strong anti-slavery views, actively furthered the work of the "underground railroad," of which Detroit was one of the principal "transfer" points. He was one of the organizers in Michigan of the Republican Party, and in 1857 succeeded Lewis Cass in the U.S. Senate, serving until 1875. Throughout the Civil War he allied himself with the most radical of the Republican faction in opposition to President Lincoln's policy, and subsequently became one of the bitterest opponents of President Johnson's plan of reconstruction. From Oct. 1875, to March 1877, he was secretary of the interior in the cabinet of President Grant. In Feb. 1879, he was re-elected to the Senate.

ENGLISH CHANDELIER BY ADAMS, ILLUSTRATIVE OF THE MORE ELABORATE MODELS OF THE LATTER PART OF THE 18TH CENTURY

He died at Chicago, Ill., on Nov. 1, 1879. By his extraordinary force of character he exercised a wide personal influence during his lifetime, but failed to stamp his personality upon any measure or policy of lasting importance.

CHANDOS, BARONS AND DUKES OF. The English title of Chandos began as a barony in 1554, and was continued in the family of Brydges (becoming a dukedom in 1719) till 1789. In 1822 the dukedom was revived in connection with that of Buckingham.

JOHN BRYDGES, 1st Baron Chandos (c. 1490–1557), a son of Sir Giles Brydges, or Bruges (d. 1511), was a prominent figure at the English court during the reigns of Henry VIII., Edward VI. and Mary. He took part in suppressing the rebellion of Sir Thomas Wyatt in 1554, and as lieutenant of the Tower of London during the earlier part of Mary's reign, had the custody, not only of Lady Jane Grey and of Wyatt, but for a short time of the princess Elizabeth. He was created Baron Chandos of Sudeley in 1554, one of his ancestors, Alice, being a grand-daughter of Sir Thomas Chandos (d. 1375), and he died in March 1557. The three succeeding barons, direct descendants of the 1st baron, were all members of parliament and persons of some importance. Grey, 5th Baron Chandos (c. 1580–1621), lord-lieutenant of Gloucestershire, was called the "king of the Cotswolds," owing to his generosity and his magnificent style of living at his residence, Sudeley Castle. His elder son George, 6th Baron Chandos (1620–1655), was a supporter of Charles I. during his struggle with Parliament. After the death of his brother William in 1676 the barony came to a kinsman, Sir James Brydges, Bart. (1642–1714), who was English ambassador to Constantinople from 1680–1685.

JAMES BRYDGES, 1st duke of Chandos (1673–1744), son and heir of the last-named, had been member of parliament for Hereford from 1698 to 1714, and, three days after his father's death, was created Viscount Wilton and earl of Carnarvon. For eight years, from 1705 to 1713, during the War of the Spanish Succession, he was paymaster-general of the forces abroad, and in this capacity he amassed great wealth. In 1719 he was created marquis of Carnarvon and duke of Chandos. The duke is chiefly remembered on account of his connection with Handel and with Pope. He built a magnificent house at Canons near Edgware in Middlesex. For over two years Handel, employed by Chandos, lived at Canons, where he composed his oratorio *Esther*. Pope, who in his *Moral Essays* (*Epistle to the Earl of Burlington*) doubtless described Canons under the guise of "Timon's Villa," referred to the duke in the line, "Thus gracious Chandos is belov'd at sight"; but Swift, less complimentary, called him "a great complier with every court." After his death on Aug. 9, 1744, Canons was pulled down. He was succeeded by his son Henry, 2nd duke (1708–1771), and grandson James, 3rd duke (1731–1789). The third duke's only daughter, Anna Elizabeth, who became Baroness Kinloss on her father's death, was married in 1796 to Richard Grenville, afterwards marquess of Buckingham; and in 1822 this nobleman was created duke of Buckingham and Chandos (see BUCKINGHAM, DUKES OF).

See G. E. C(okayne), *Complete Peerage* (1887–98); and J. R. Robinson, *The Princely Chandos, i.e., the 1st duke* (1893).

CHANDOS, SIR JOHN (d. 1370), English soldier, fought at the siege of Cambrai (1337), at Crécy in 1346, and at Poitiers, where he saved the life of the Black Prince. For these services Edward III. gave him the lands of the viscount of Saint Sauveur in Contentin, and appointed him lieutenant in France, and vice-chamberlain of the royal household in 1360. In 1362 he was made constable of Guienne, and defeated Charles de Blois at Auray in 1364. Chandos accompanied the Black Prince on his expedition in 1367, to restore Pedro the Cruel to the throne of Castile, and won the victory of Navaret over Bertrand du Guesclin. Appointed seneschal of Poitou in 1369, he was mortally wounded in an encounter with the French at the bridge of Lussac near Poitiers, and died on the day after the battle, Jan. 1, 1370.

CHANDRAGUPTA MAURYA (reigned 321–296 B.C.), known to the Greeks as Sandracottus, founder of the Maurya empire and first paramount ruler of India, was the son of a king of Magadha by a woman of humble origin, whose caste he took and

whose name, Mura, is said to have been the origin of that of Maurya assumed by his dynasty. As a youth he was driven into exile by his kinsman, the reigning king of Magadha. In the course of his wanderings he met Alexander the Great, and, according to Plutarch (*Alexander*, cap. 62), encouraged him to invade the Ganges kingdom. On the death of Alexander he attacked the Macedonian garrisons and conquered the Punjab. He next attacked Magadha, dethroned and slew the king, and established himself on the throne (321). The great army acquired from his predecessor he increased until it reached the total of 30,000 cavalry, 9,000 elephants and 600,000 infantry; and with this huge force he overran all northern India, establishing his empire from the Arabian sea to the Bay of Bengal. In 305 Seleucus Nicator crossed the Indus, but was defeated by Chandragupta and forced to a humiliating peace (303), by which the empire of the latter was still farther extended in the north. About six years later Chandragupta died, leaving his empire to his son Bindusura.

An excellent account of the court and administrative system of Chandragupta has been preserved in the fragments of Megasthenes, who came to Pataliputra as the envoy of Seleucus shortly after 303.

See J. W. MacCrimble, *Ancient India as described by Megasthenes and Arrian* (Calcutta, 1877); V. A. Smith, *Early Hist. of India*, ed. S. M. Edwards (1924); also the articles INDIA: *History* and INSCRIPTIONS: *Indian*.

CHANGARNIER, NICOLAS ANNE THÉODULE (1793–1877), French general, was born at Autun on April 26, 1793. Educated at St. Cyr, he served for a short time in the bodyguard of Louis XVIII., and entered the line as a lieutenant in January 1815. In 1830 he entered the Royal Guard and was sent to Algeria, where he served with great distinction until 1848, and had just succeeded Gen. Cavaignac as governor of the colony when he was recalled to command the National Guard. An avowed enemy of republican institutions, he at first upheld the power of the president; but in January 1851 he opposed Louis Napoleon's policy, was deprived of his double command, and at the *coup d'état* in December was arrested and sent to Mazas until his banishment from France by the decree of Jan. 9, 1852. He returned to France after the general amnesty. In 1870 he was present with the headquarters, and afterwards with Bazaine in Metz. He was employed on an unsuccessful mission to Prince Frederick Charles, commanding the German army which besieged Metz, and on the capitulation became a prisoner of war. At the armistice he returned to Paris, and in 1871 was elected to the National Assembly by four departments, and sat for the Somme. He took an active part in politics, defended the conduct of Marshal Bazaine, and served on the committee which elaborated the monarchical constitution. When the comte de Chambord refused the compromise, he moved the resolution to extend the executive power for ten years to Marshal MacMahon. He was elected a life senator in 1875. He died in Paris on Feb. 14, 1877.

See Comte d'Antioche, *Changarnier* (1891).

CHANG CHUN, KIU (1148–1227), Chinese Taoist sage and traveller, was born in 1148. In 1219 he was invited by Jenghiz Khan, founder of the Mongol empire and greatest of Asiatic conquerors, to visit him. Jenghiz' letter of invitation, dated May 15, 1219 (by present reckoning), has been preserved, and is among the curiosities of history; here the terrible warrior appears as a meek disciple of wisdom, modest and simple, almost Socratic in his self-examination, alive to many of the deepest truths of life and government. Chang Chun obeyed this summons; and leaving his home in Shantung (Feb. 1220), journeyed first to Peking. Learning that Jenghiz had gone far west upon fresh conquests, the sage stayed the winter in Peking. In February 1221 he started again and crossed eastern Mongolia to the camp of Jenghiz' brother Ujughen, near Lake Bôr or Buyur in the upper basin of the Kerulun-Amur. Thence he travelled south-westward up the Kerulun, crossed the Karakorum region in north-central Mongolia, and so came to the Chinese Altai, probably passing near the present Uliassutai. After traversing the Altai he visited Bishbalig (modern Urumtsi), and moved along the north side of the Tian Shan range to lake Sairam, Almalig (or Kulja), and the
